G O B

Gobbo
||
God.

GOBBO (PIETRO PAOLO CORTONESE, so called), a celebrated painter of fruit and landscapes, was born at Cortona in 1580, and learned the principles of design from his father; but was afterwards the disciple of one Crescentio at Rome, and perfected himself in the most essential parts of his profession, by studying after nature, with judgment and accuracy. His merit soon recommended him to the notice and esteem of the most able judges at Rome; and as he excelled equally in painting fruit and landscape, he found a generous patron in cardinal Borghese, who employed him to adorn his palace. The fruit which he painted had so true and expressive an imitation of nature, that nothing could possibly be more exact; and by his thorough knowledge of the chiaro-scuro, he gave an extraordinary roundness and relief to every object. But his greatest excellence consisted in his colouring; for in design he was not remarkably superior to others. He died in 1640.

GOBELIN (Giles), a famous French dyer, in the reign of Francis I. discovered a method of dying a beautiful scarlet, and his name has been given ever since to the finest French scarlets. His house, in the suburb of St Marcel at Paris, and the river he made use of, are still called *the Gobelins*. An academy for drawing, and a manufactory of fine tapestries, were erected in this quarter in 1666; for which reason the tapestries are called *the Gobelins*.

GOBIUS, in ichthyology, a genus of fishes belonging to the order of thoracici. They have two holes between the eyes, four rays in the membrane of the gills, and the belly-fins are united in an oval form. There are eight species, principally distinguished by the number of rays in their fins.

GOBLET, or **GOBLET**, a kind of drinking cup, or bowl, ordinarily of a round figure, and without either foot or handle. The word is French, *gobelet*; which Salmasius, and others, derive from the barbarous Latin *cupa*. Budeus deduces it from the Greek *κυπελλον*, a sort of cup.

GOD, one of the many names of the Supreme Being. See CHRISTIANITY, METAPHYSICS, MORAL PHILOSOPHY, and THEOLOGY.

God is also used in speaking of the false deities of the heathens, many of which were only creatures to which divine honours and worship were superstitiously paid.

The Greeks and Latins, it is observable, did not mean by the name *God*, an all-perfect being, whereof eternity, infinity, omnipresence, &c. were essential at-

G O D

God,
Godal-
ming.

tributes: with them, the word only implied an excellent and superior nature; and accordingly they give the appellation *gods* to all beings of a rank or class higher and more perfect than that of men; and especially to those who were inferior agents in the divine administration, all subject to the one Supreme. Thus men themselves, according to their system, might become gods after death; inasmuch as their souls might attain to a degree of excellence superior to what they were capable of in life.

The first divines, father Bossu observes, were the poets: the two functions, though now separated, were originally combined; or, rather, were one and the same thing.

Now the great variety of attributes in God, that is, the number of relations, capacities, and circumstances, wherein they had occasion to consider him, put these poets, &c. under a necessity of making a partition, and of separating the divine attributes into several persons; because the weakness of the human mind could not conceive so much power and action in the simplicity of one single divine nature. Thus the omnipotence of God came to be represented under the person and appellation of Jupiter; the wisdom of God, under that of Minerva; the justice of God, under that of Juno.

The first idols or false gods that are said to have been adored, were the stars, sun, moon, &c. on account of the light, heat, and other benefits, which we derive from them. Afterwards the earth came to be deified, for furnishing fruits necessary for the subsistence of men and animals; then fire and water became objects of divine worship, for their usefulness to human life. In process of time, and by degrees, gods became multiplied to infinity; and there was scarce any thing but the weakness or caprice of some devotee or other elevated into the rank of deity; things useless or even destructive not excepted. See MYTHOLOGY.

GODALMING, a town of England, in the county of Surry, on the river Wey, 35 miles from London. It is a corporation; by whose charter their chief magistrate is a warden chosen yearly, who has 8 brethren his assistants. The parish is divided into 9 tithings. Its river abounds with good fish; and drives a grist-mill, two paper-mills, and three corn-mills; over which river a new bridge was begun July 22d 1783. Here is a manufactory of mixed and blue kerseys, also a manufactory of stockings; and the place is also famous for liquorice, and store of peat that burns better than pit-coal: but a woman of this town (Mary Tofts) in 1726 endeavoured to render it infamous, by a pretend-

ed delivery of rabbets; by which, however, she for some time puzzled some noted physicians, anatomists, &c. In 1739, the small-pox carried off above 500 persons here in 3 months, which was more than a third of the inhabitants.

GODDARD (Jonathan), an eminent physician and chemist, and one of the first promoters of the Royal Society, was born about the year 1617. He was elected a fellow of the college of physicians in 1646, and appointed reader of the anatomical lecture in that college in 1647. As he took part against Charles I. accepted the wardenship of Merton-college, Oxford, from Oliver Cromwell when chancellor, and sat sole representative of that university in Cromwell's parliament, he was removed from his wardenship in a manner disgraceful to him by Charles II. He was however then professor of physic at Gresham college, to which he retired, and continued to attend those meetings that gave birth to the Royal Society; upon the first establishment of which, he was nominated one of the council. Being fully persuaded that the preparation of medicines was no less the physician's duty than the prescribing them, he constantly prepared his own; and in 1668 published a treatise recommending his example to general practice. He died of an apoplectic fit in 1674; and his memory was preserved by the drops that bore his name, otherwise called *Gutta Anglicana*, the secret of which he sold to Charles II. for 5000 l. and which Dr Lister assures us was only the volatile spirit of raw silk rectified with oil of cinnamon or some other essential oil. But he claims more particular regard, if what bishop Seth Ward says be true, that he was the first Englishman who made that noble astronomical instrument, the telescope.

GODDESS, a heathen deity of the female sex.

The ancients had almost as many goddesses as gods: such were, Juno the goddess of air, Diana the goddess of woods, &c. and under this character were represented the virtues, graces, and principal advantages of life; truth, justice, piety, liberty, fortune, victory, &c.

It was the peculiar privilege of the goddesses to be represented naked on medals; for it was supposed that the imagination must be awed and restrained by the consideration of the divine character.

GODEAU (Anthony), bishop of Grasse and Vence in France, was born at Dreux in 1605. He was a very voluminous writer, both in prose and verse; but his principal works are, 1. *An ecclesiastical history*, 3 vols. folio, containing the first eight centuries only, as he never finished more. 2. *Translation of the Psalms into French verse*; which was so well approved, that even those of the reformed religion preferred it to that of Marat. He died in 1671.

GODFATHERS and **GODMOTHERS**, persons who, at the baptism of infants, answer for their future conduct, and solemnly promise that they will renounce the devil and all his works, and follow a life of piety and virtue; and by this means lay themselves under an indispensable obligation to instruct them, and watch over their conduct.

This custom is of great antiquity in the Christian church; and was probably instituted to prevent children being brought up in idolatry, in case their parents died before they arrived at years of discretion.

The number of godfathers and godmothers is re-

duced to two, in the church of Rome; and three, in the church of England; but formerly they had as many as they pleased.

GODFREY (of Bouillon), prince of Lorrain, a most celebrated crusader, and victorious general. He was chosen general of the expedition which the Christians undertook for the recovery of the Holy Land, and sold his dukedom to prepare for the war. He took Jerusalem from the Turks in 1099; but his piety, as historians relate, would not permit him to wear a diadem of gold in the city where his Saviour had been crowned with thorns. The sultan of Egypt afterwards sent a terrible army against him; which he defeated, with the slaughter of about 100,000 of the enemy. He died in 1160.

GODMANCHESTER, a town of Huntingdonshire, 16 miles from Cambridge, and 57 from London. It has a bridge on the Ouse, opposite to Huntingdon; was formerly a Roman city, by the name of Durofiponte, where many Roman coins have been often dug up; and according to old writers, in the time of the Saxons it was the see of a bishop, and had a castle built by one Gorman a Danish king, from which the town was called Gormanchester. It is reckoned one of the largest villages in England, and is seated in a fertile soil, abounding with corn. It is said that no town in England kept more ploughs at work than this has done. The inhabitants boast they formerly received our kings as they made a progress this way, with nine score ploughs at a time, finely adorned with their trappings, &c. James I. made it a corporation by the name of two bailiffs, 12 assistants, and the commonalty of the borough of Godmanchester. Here is a school, called the Free Grammar-School of queen Elizabeth. On the west side of the town is a noble though ancient seat of the Earl of Sandwich. Near this place, in the London road between Huntingdon and Caxton, is a tree well known to travellers by the name of Beggar's-Bush.

GODOLPHIN (John), an eminent English civilian, was born in the island of Scilly in 1617, and educated at Oxford. In 1642-3, he was created doctor of civil law; in 1653, he was appointed one of the judges of the admiralty; and at the Restoration, he was made one of his majesty's advocates. He was esteemed as great a master of divinity as of his own faculty; and published, 1. *The holy limbeck*. 2. *The holy harbour*. 3. *A view of the admiral's jurisdiction*. 4. *The orphan's legacy*. 5. *Repertorium canonicum*, &c. He died in 1678.

GODSTOW, a place northwest of Oxford, in a sort of island formed by the divided streams of the Isis after being joined by the Evenlode. It is noted for catching of fish and dressing them; but more so for the ruins of that nunnery which fair Rosamond quitted for the embraces of Henry II. The people show a great hole in the earth here, where they say is a subterraneous passage, which goes under the river to Woodstock, by which she used to pass and repass. Little more remains at present than ragged walls, scattered over a considerable extent of ground. An arched gateway, and another venerable ruin, part of the tower of the conventual church, are still standing. Near the altar in this church fair Rosamond was buried, but the body was afterwards removed by order of a bishop of Lincoln,

Godfrey
||
Godstow.

Godwin
||
Gog.

Lincoln, the visitor. The only entire part is small, formerly a private chapel. Not many years since a stone coffin, said to have been Rosamond's, who perhaps was removed from the church to this place, was to be seen here. The building has been put to various uses, and at present serves occasionally for a stable.

GODWIN (Francis), successively bishop of Landaff and Hereford, was born in 1567. He was eminent for his learning and abilities; being a good mathematician, an excellent philosopher, a pure Latinist, and an accurate historian. He understood the true theory of the moon's motion a century before it was generally known. He first started those hints afterwards pursued by Bishop Wilkins, in his "Secret and swift messenger;" and published "A catalogue of the lives of English bishops." He has nevertheless been accused as a great simoniac, for omitting no opportunity of disposing of preferments in order to provide for his children. He died in 1648.

GODWIN (Thomas), a learned English writer born in 1517, was master of the free-school at Abington in Berkshire; where he educated a great many youths, who became eminent both in church and state. His works show him to have been a man of great learning: such as, *Historiæ Romanæ anthologia*, *Synopsis antiquitatum Hebraicarum*, *Moses & Aaron*, *Florilegium Phrasi-con*, &c. He died in 1642.

GODWIN, or *Goodwin Sands*, famous sand-banks off the coast of Kent, lying between the N. and S. Foreland; and as they run parallel with the coast for three leagues together, at about two leagues and a half distant from it, they add to the security of that capacious road, the Downs: for while the land shelters ships with the wind from south-west to north-west only, these sands break all the force of the sea when the wind is at east south-east. The most dangerous wind, when blowing hard on the Downs, is the south south-west. These sands occupy the space that was formerly a large tract of low ground belonging to Godwyn earl of Kent, father of King Harold; and which being afterward given to the monastery of St Augustin at Canterbury, the abbot neglecting to keep in repair the wall that defended it from the sea, the whole tract was drowned, according to Salmon, in the year 1100, leaving these sands, upon which so many ships have since been wrecked.

GODWIT, in orinthology. See SCOLOPAX.

GOG and MAGOG, two names generally joined together in scripture, (Ezek. xxxviii. 2. 3. &c. xxxix. 1, 2, &c. Rev. xx. 8.) Moses speaks of Magog the son of Japhet, but says nothing of Gog, (Gen. x. 2. 1. Chr. i. 5.) Gog was prince of Magog, according to Ezekiel. Magog signifies the country or people, and Gog the king of that country. The generality of the ancients made Magog the father of the Scythians and Tartars; and several interpreters discovered many footsteps of their name in the provinces of Great Tartary. Others have been of opinion that the Persians were the descendants of Magog; and some have imagined that the Goths were descended from Gog and Magog; and that the wars described by Ezekiel, and undertaken by Gog against the saints, are no other than those which the Goths carried on in the fifth age against the Roman empire.

Bochart has placed Gog in the neighbourhood of Caucasus. He derives the name of this celebrated

mountain from the Hebrew *Gog chasan*, "the fortress of Gog." He maintains that Prometheus, said to be chained to Caucasus by Jupiter, is Gog, and no other. There is a province in Iberia called the Gogarene.

Lastly, the generality believe, that Gog and Magog, mentioned in Ezekiel and the Revelations, are to be taken in an allegorical sense, for such princes as were enemies to the church and saints. Thus many by Gog in Ezekiel understand Antiochus Epiphanes, the persecutor of those Jews who were firm to their religion; and by the person of the same name in the Revelations, they suppose Antichrist to be meant; the great enemy of the church and faithful. Some have endeavoured to prove that Gog, spoken of in Ezekiel, and Cambyfes king of Persia, were one and the same person; and that Gog and Magog in the Revelations denote all the enemies of the church, who should be persecutors of it to the consummation of ages.

GOGGLES, in surgery, are instruments used for curing squinting, or that distortion of the eyes which occasions this disorder. They are short conical tubes, composed of ivory stained black, with a thin plate of the same ivory fixed in the tubes near their anterior extremities. Through the centre of each of these plates is a small circular hole, about the size of the pupil of the eye, for the transmission of the rays of light. These goggles must be continually worn in the day-time, till the muscles of the eye are brought to act regularly and uniformly, so as to direct the pupil straight forwards; and by these means the cure will be sooner or later effected.

GOGMAGOG-HILLS, are hills so called, three miles from Cambridge, remarkable for the intrenchments and other works cast up there: whence some suppose it was a Roman camp; and others, that it was the work of the Danes.

GOGUET (Antony-Yves), a French writer, and author of a celebrated work, intitled, *L'Origine des Loix, des Arts, des Sciences, & de leur Progres chez les anciens Peuples*, 1758, 3 vols. 4to. His father was an advocate, and he was born at Paris in 1716. He was very unpromising as to abilities, and reckoned even dull in his early years; but his understanding developing itself, he applied to letters, and at length produced the above work. The reputation he gained by it was great: but he enjoyed it a very short time, dying the same year of the small-pox; which disorder, it seems, he always dreaded. It is remarkable, that Conrad Fugere, to whom he left his library and his MSS, was so deeply affected with the death of his friend, as to die himself three days after him. The above work has been translated into English, and published in 3 vols. 8vo.

GOLCONDA, a kingdom of Asia, in the peninsula on this side the Ganges. It is bounded on the north by that of Orixá, on the west by that of Balagate, on the south by Bisnagar, and on the east by the gulph of Bengal. It abounds in corn, rice, and cattle; but that which renders it most remarkable are the diamond-mines, they being the most considerable in the world: they are usually purchased of the black merchants, who buy parcels of ground to search for these precious stones in. They sometimes fail in meeting with any, and in others they find immense riches. They have also mines of salt, fine iron for sword-blades, and curious callicoes and chintzes. It

Goggles
||
Golconda.

Gold.

is subject to the Great Mogul; and has a town of the same name, seated at the foot of a mountain, being one of the largest in the East Indies. It is about six miles in circumference; and was formerly the residence of the kings, till it was conquered by the Great Mogul. It is now much frequented by the European merchants. E. Long. 70. 10. N. Lat. 16. 30.

GOLD, the most valuable of all the metals, is of a bright yellow colour when pure, but becomes more or less white in proportion as it is alloyed with other metals. It is the heaviest of all known bodies, platina only excepted, its specific gravity being to that of distilled water as 19.640 to 1000. It melts in a low white heat; requiring, according to Mr Wedgewood's calculation, 5237 degrees of Fahrenheit's, or 32 of his own, thermometer for its fusion; a heat greatly superior to that which melts silver or copper; the former requiring only 4717, and the latter 4587 of Fahrenheit. Other metallurgists, however, have differed, and assert that copper requires for its fusion a greater degree of heat than either gold or silver.

Gold is by far the most tough and ductile, as well as the most malleable, of all metals. According to Cronstedt, one grain of it may be stretched out so as to cover 98 Swedish ells, equal to 63.66 English yards of silver wire; but Wallerius asserts, that a grain of gold may be stretched in such a manner as to cover 500 ells of wire. At any rate, the extension is prodigious; for, according to the least of these calculations, the millionth part of a grain of gold may be made visible to the naked eye. Nor is its malleability inferior to its ductility. Boyle, quoted by Apligny in his Treatise of Colours, says, that one grain and an half of gold may be beaten into 50 leaves of one inch square, which, if intersected by parallel lines drawn at right angles to each other, and distant only the 100th part of an inch from each other, will produce 25 millions of little squares, each very easily discernible by the naked eye. Mr Magellan tells us, that its surface may be extended by the hammer 159092 times. "I am informed (says he) by an intelligent gold-beater in England, that the finest gold leaf is that made in new skins, and must have an alloy of three grains of copper to the ounce troy of pure gold, or else it would be too soft to pass over the irregularities of the skins. He affirms, that 80 books, or 2000 leaves of gold, each measuring 3.3 square inches, viz. each leaf containing 10.89 square inches, weigh less than 384 grains. Each book, therefore, or 25 leaves, = 272.23 inches, weighs less than 4.8 grains; so that each grain of the metal will produce 56.718 square inches." From further calculations it may be made to appear, that the thickness of these leaves is less than $\frac{1}{11180}$ th of an inch; and that 16 ounces of gold would be sufficient to gild a silver wire equal in length to the whole circumference of the globe.

Gold is more elastic than lead or tin, but less so than iron, or even copper. It grows hard and brittle by hammering, but resumes its ductility on being slowly heated. Gold leaf exhibits a fine green colour on being interposed between the eye and the beams of the sun or any other luminous body. When exposed for some time to a strong heat, it becomes ignited, and at last melts, assuming at the same time a fine bluish-green colour; and, when cold, crystallizes into quadrilateral pyramids. This bluish-green colour, according to Mr

Magellan, as well as the former, when a thin film of the metal is interposed betwixt the eye and the luminous body, is owing to transmitted light. "The green light (says he) is transmitted in both cases, since all reflected colours are produced by the transmission of light, as the ingenious philosopher Mr Delaval has lately discovered and demonstrated in his very elaborate treatise on this subject, inserted in the second volume of the memoirs published in 1785 by the Philosophical Society of Manchester." Sir Isaac Newton, in his Optics (page 162, edition of 1730), accounts for that phenomenon, saying, that "gold foliated, and held between the eyes and the light, looks of a greenish blue; and therefore (says he) massy gold lets into its body the blue rays to be reflected to and fro within it, till they be stopped and stifled; while it reflects the yellow outwards, and therefore looks yellow." It is therefore, in the two above cases, that some of the blue rays are transmitted along with the yellow ones; and both together appear of a bluish-green. If gold be exposed to the joined rays of light, excepting only the yellow ones, which we suppose stopped after they were separated by a prism, it only looks white like silver; "which shows (says Sir Isaac Newton) that its yellowness arises from the excess of intercepted rays tinging that whiteness with their colour when they are let to pass. It is a pleasing observation to look with a deep magnifier on various pieces of gold, silver, and Dutch (copper) leaves between the eye and the sunshine. The particles of silver are seen in the form of oblong dark lumps, with some interstices, like net-work, between them: those of the copper-leaf are more numerous and more regularly distributed; but the particles of the gold-leaf appear like little green semitransparent and similar particles, uniting between themselves by nearly diaphanous joints, as if they were forced to flatten in their edges, rather than they would break their mutual cohesion with one another."

Gold is more generally found native than any other metal; though Bergman informs us, that he does not know an instance of its ever being found perfectly free of alloy. Kirwan says it is seldom found so; being generally alloyed with silver, copper, or iron, and sometimes with all the three. According to Wallerius, native gold is found, 1. In solid masses, in Hungary, Transylvania, and Peru. 2. In grains in the Spanish West Indies. 3. In a vegetable form, like the branches or twigs of plants. 4. In a *druse* figure, as if composed of groups or clusters of small particles united together, found in Hungary. 5. Composed of thin plates, or thin pellicles, covering other bodies, found in Siberia. 6. In a crystalline form in Hungary.

The same author informs us, that gold, in its reguline state, is formed either into angular crystals composed of yellow octaedrons, or into yellow irregular masses, which show a grain-like texture. Brunnich says, that the native gold found in leaves is always crystallized on the surface; and with a magnifier they may be seen of a triangular pyramidal form. He informs us also, that in Transylvania he procured a specimen of cubic native gold, but never saw it any where else.

Gold is also found in the form of thick solid pieces. It is in general more frequently imbedded in quartz, and mixed with it, than with any other stone; and the quartz in which the gold is found in the Hun-

Gold.

garian

Gold. garian mines, Mr Magellan tell us, is of a peculiar mild appearance. Sometimes, however, it is found in limestone, or in hornblende, &c.

Europe is principally supplied with gold from Chili and Peru in South America. A small quantity is likewise imported from China and the coast of Africa. The principal gold mines of Europe are those of Hungary, and next to them the mines of Saltzburg. The mines of Adelfors in Smoland are likewise worked to advantage; and the veins of metal appear to be diffused over a great tract of land. Some gold from four to seven grains in the mark is also said to be extracted from the silver of the mines of Osterilverberget in the province of Dalarna. Native gold has also been found in Lapland above Tornea, and in Westmanland. In Peru it is found mixed with a stony matter not well known, from which it is extracted by amalgamation. Mr Pallas mentions three gold mines that are worked there, near the river Pyschma, in which 500 men are employed. The metal is found in a powdery form, and also in thin plates or leaves. Sometimes kernels or lumps of a spongy texture, and very light, are met with which contain a good quantity of gold-dust. This gold-dust or wash-gold is usually washed out of sands wherein it lies in the form of loose grains or lumps. It is distinguished by the variously coloured substances wherewith it is mixed. The metal is also found separate from any matrix in lumps or visible grains mixed with sands. Thus it is met with in many rivers of Europe as well as the other quarters of the world. It is also visibly dispersed through masses of sand, particularly such as is of a yellowish-red or violet colour; and in this state it is so universally diffused through every kind of earth, that Mr Bergman thinks it the most common of all the metals, iron alone excepted. If 100 pounds of sand contain 24 grains of gold, the separation is said to be worth attending to. In Africa 5 pounds of sand often yield 63 grains of gold, or even more; and the heaviest sand, which is often black or red, contains the most. In Hungary, however, only 10 or 12 grains of gold are contained in 10,000 pounds of sand; and even this trifling quantity has been extracted, though with loss.

Gold is brought down with most of the large rivers; even those which do not take their rise in mountains where gold is found. In Transylvania the river of Avanyos affords subsistence to upwards of 700 Gipsy families, who collect the gold from it. In Brasil it is found in such abundance, that their torrents are often turned with great labour and expence into new beds, in order to gather the gold there deposited by the running waters.—It is also found there mingled with the earth in various shapes and forms.—It is likewise said to be sometimes found in veins running through beds of coals.

Gold is said to be mineralized, when it is mixed with some other substance in such a manner as not to be acted upon by aqua regia. In this manner gold is mineralized.

1. *By Sulphur.* Many have insisted, that as gold and sulphur are not found to have any chemical attraction for one another, it is impossible that marcasite can contain any of the metal, or indeed that it can be found in any ore containing sulphur; but since we

know by experience, that gold can be melted out of these ores, even after they have been digested in aqua regia, and that gold likewise enters into their sulphurated regulus, there is the greatest reason to believe, that some third substance, probably a metal, has by its admixture enabled the sulphur to unite with a certain quantity of gold. Marcasites, however, contain, at any rate, only a small quantity of the precious metal; and none is to be expected from them in places where no gold is in the neighbourhood. “I am not perfectly clear (says Cronstedt) whether the gold is really dissolved and indurated, or, if I may so express myself, *vitriified* in the *schirls*; provided, by this mineral body, we mean a garnet substance. But I have seen a piece of what is called *schirl*, whose texture was exactly like the Schemnitz blende; and in this case it might perhaps hold the same contents.”

2. *With Sulphur by means of Iron:* Golden pyrites, or marcasitical gold-ore. This is a close and compact substance of a bright yellow colour. Here the gold is said to be mineralized by sulphur by means of iron, because it cannot be extracted by aqua regia or by amalgamation. A kind of gold pyrites is found at Adelfors in the province of Smoland, which contains an ounce or less of gold in an hundred weight of the ore. The Transylvania gold pyrites, according to Brunnich, in which no gold can be perceived by the naked eye, contain from 50 to 100 and 110 ounces and upwards in an hundred weight. Those where the gold appears in the pyrites like strewed Spanish snuff, hold 250 ounces, but they are very scarce. The mountain of Faczebaya, near Zalathna, is remarkable for its gold pyrites; and here they seem also to contain semimetallic parts.

The following is M. Magellan's method of accounting for the union of gold with this kind of pyrites. “It is well known, that gold may be dissolved by liver of sulphur. The process given for this purpose by M. Apligny, p. 156 of his *Treatise on Colours*, is as follows. Reduce to powder four pounds of vegetable alkali (salt of tartar), and as many of sulphur, with one of leaves of gold. Melt the mixture in a crucible with its cover; pour the fused matter out on a marble stone; pound it again when cold, and put the whole in a matress with hot water; which being filtrated is of a greenish-yellow colour, containing the gold dissolved. Now, as we know that *hepar sulphuris* has been found in several pyrites, and Mascagni says that he found it in those lagoons near Sienna in Italy; is it not very natural to conclude, that this noble metal may be really mineralized in the auriferous pyrites?”

3. *Auriferous Cinnabar*, in which the metal is mineralized by means of quicksilver, said to be found in Hungary. Mr Sage speaks of a specimen of gold from Hungary, now in the French king's cabinet at Paris, which is crystallized into quadrangular prisms of a grey-yellowish colour and a brittle consistency, which he supposes to be the result of a mercurial amalgam of native gold.

4. *The Schemnitz Blende*, in which the gold is mineralized by means of zinc and iron. Cronstedt informs us, that the ores of zinc at Schemnitz in Hungary contain a great deal of silver, and that this silver is very rich in gold. Professor Brunnich enumerates the following varieties of this ore. 1. Where the metal

Gold.

Gold.

is mineralized by means of a cubic lead-ore, containing silver found in the mines of Michaeli and some places in Transylvania. 2. By a copper pyrites with silver. This kind of ore is called *gils* in Hungary: it has a compact surface of a pale yellow colour; but must not for that reason be confounded with the auriferous pyrites. 3. The Cremnitz-ores in which the metal is mineralized by means of red gilder ore. 4. By means of antimony, in which it sometimes appears. This kind is found at the foot of the Carpathian mountains. 5. By cubic lead-ore, iron, and some unknown volatile parts. This ore, as described by Scopoli, is of a black colour; the richest pieces are lamellated almost like an iron-glimmer, with a degree of flexibility. The vein is quartz, which is sometimes loose, and the metal scattered very minutely in it. It is found in Transylvania. 6. Native gold, with black-lead (or molybdæna), has been found near Rimezembat in Upper Hungary; but our author (Professor Brunnich) has not had any opportunity of examining whether it is mineralized by it or not. In all the above species, the gold is either entirely native, but so minutely divided, and so loosely scattered, that it can only be seen through microscopes, and often cannot be seen at all before it is separated by various processes: or it may not be in the form of native gold, but the metal as it were in embryo; in which case fire is necessary to bring the constituent parts together, and to add those that are wanting; in that case likewise it is never without silver.

“To these (says Mr Magellan) may be added the following ores. 1. Gold, with arsenical pyrites, is found also at Saltzberg in Tyrol, in mountains of quartz and schistus. It contains only 25 grains in the quintal; nevertheless it affords a profit of L. 500 per annum. 2. With a white, red, or vitreous silver-ore, near Cremnitz and Schemnitz in Hungary. 3. With a sulphurated ore of silver, iron, lead, and manganese, at Nagaya in Transylvania. Its specific gravity is 4.043, and it is said to afford 10 ounces per quintal. 4. With sulphurated iron, copper, and manganese, at Nagaya.”

The strongest heat of any furnace does not change the metallic properties of gold. Kunckel and Boyle made the experiment by exposing gold for several months to the fire of a glass-house. It appears, however, that, by the violent heat of the sun-beams collected in the focus of a burning-glass, some alteration may be produced in it. Homberg observed that gold, when exposed to the lens of Tschirnhausen, formed, was volatilized, and even vitrified; and Macquer found, that the metal, when exposed to the lens of Mr Trudaine, exhaled a fume which gilded silver, and was therefore gold in a volatile state: the globule of melted gold was agitated with a rapid circular motion, and became covered with a dull and as it were calciform pellicle; and lastly, that a violet vitrification was formed on the middle of the globule. This vitrification gradually extended, and produced a kind of button, flatter, or of a larger curvature, than that of the globule, and which stuck upon it as the transparent cornea appears on the sclerotica of the eye. This glass increased in size, while the gold itself continually diminished: the support always appeared tinged with a purple colour, seemingly produced by the absorption

of part of the glass. Time did not permit him to vitrify a quantity of gold entirely. He observes, that it is a necessary condition that the violet glass should be reduced with combustible matters, in order to justify the assertion that it is the calx of that perfect metal, which would evidently appear to be the case if it became revived into gold. But however this may be, Mr Fourcroy is of opinion that this ought to be considered as a true vitrified calx of gold; and this with the greater probability, as in many operations with this metal the purple colour is constantly produced, and many preparations of gold are employed to give that colour to enamel and porcelain. “Gold (says he) is therefore calcinable like the other metals; and only requires, as likewise does silver, a stronger heat, and a longer time to unite with the base of air than other metallic substances.” Mr Kirwan, on the other hand, tells us, that “gold exposed to the utmost heat of Mr Parker’s lens for some hours, lost no sensible part of its weight; yet, when in contact with earthy matters, it communicated a blue or purplish tinge to them; so that he believes an exceeding small portion of it might be dephlogisticated.”

This experiment with the lens of Mr Parker does not invalidate that of Macquer: for either Trudaine’s lens may be more powerful than Mr Parker’s; or the air in France being more clear than in England, the action of the sun must be stronger. We are assured, however, that by means of the electric fire gold may be instantaneously calcined and even vitrified: whence we must conclude, not only that gold is really calcinable, but that the electric fire is almost infinitely more powerful than any other; as by its means we may in a moment accomplish what either cannot be done otherwise at all, or very imperfectly, even by the fiercest fire we can raise. The flame of a lamp blown by dephlogisticated air is also found sufficient to volatilize gold.

Gold being thus indestructible by the common operations of fire, equally resists its slow action in the atmosphere. It is altogether exempted from rusting; and though its surface becomes tarnished by exposure to the air, it is merely in consequence of the deposition of foreign bodies upon it. Water produces no change, says Mr Fourcroy; though, according to the experiments of Lagaraye, it seems capable of dividing it nearly in the same manner as it does iron.

Gold combines with various metals; and is commonly alloyed in a certain proportion with copper, which gives it a red colour and greater firmness than it possesses when very pure, at the same time that it is thus rendered more fusible. In this state it is used for money, plate, and toys of different kinds. It is sometimes also alloyed with silver, which deprives it of its colour, and renders it very pale: this alloy, however, is not made without some difficulty, on account of the very different specific gravities of the two metals, as Homberg observed, who saw them separate during their fusion. The alloy of gold with silver forms the green gold of the jewellers and gold-beaters.

As gold has been rendered, by the universal consent of mankind, the most valuable substance in the world, it is of great consequence to be able to discover its degree of purity, in order to prevent the adulterations which would naturally be practised, and to pro-

Gold.

Gold. produce an equality of value in the different pieces dispersed in commerce. The chemical methods by which this is accomplished, are related under the articles CHEMISTRY, and ESSAYING of Metals. To ascertain with precision the quantity of imperfect metal it may contain, a given mass of gold is supposed to contain 24 parts called *carats*; each carat being supposed divided into 32 parts called *thirty-seconds of a carat*. If the gold after the operation has lost one grain in 24, it is gold of 23 carats; if it has lost a grain and a half, it is gold of 22 carats 16 thirty-seconds, and so on. The weight used in the essay of gold is called the *essay weight*, and usually consists of 24 grains; it is divided into 24 carats, which are likewise subdivided into 32 parts. An essay weight is likewise used which weighs 12 grains; and is likewise divided into 24 carats, subdivided again into thirty-seconds.

The scarcity and great price of gold prevent its being made into vessels or utensils; but as its brilliancy and colour are agreeable, methods have been found of applying it to the surface of a great number of bodies, which it thus not only beautifies, but by its indestructibility preserves from the injuries of the atmosphere. The art of applying it in this manner is called *gilding*; and the immense ductility of gold already mentioned, renders it capable of being applied in this manner at much less expence than could be imagined. It is used besides in gilding, either in a state of solution by acids, or amalgamated with mercury, which are called *water-gilding*. It was formerly used in medicine, and great virtues were ascribed to it; whence the great number of golden tinctures, elixirs, &c. of quacks; but all these are now deservedly exploded, and the best practitioners allow that gold, in whatsoever manner it be prepared, is either inactive or dangerous.

Gold in its metallic state cannot be combined with the vitrifiable earths, but its calces may; for which reason they are often used in enamel-painting and in porcelain, where they produce a beautiful violet-colour. Glass is tinged by them of a beautiful red; of which we have an account in Neri's art of glass-making; though Dr Lewis says he never could succeed in making the colour diffuse itself equally throughout the substance of the glass. See *Colouring of Glass*.

The preparation of gold called *aurum fulminans* is taken notice of under the article CHEMISTRY, n° 1103, M. Magellan takes notice of its extraordinary fulminating property, and says that its *fragor* is 64 times greater than that of an equal quantity of gun-powder. According to Bergman, the strength of the explosion is 176 times greater than that of gun-powder (20 grains of *aurum fulminans* being equivalent to half a pound of gun-powder). Bergman accounts for the amazing strength of this explosion, by supposing it owing to the quantity of air extricated at the time; but this, according to his own account, cannot be at all sufficient for such a purpose; and Magellan is of opinion that "this wonderful phenomenon seems not yet completely accounted for by any hypothesis yet known." See the articles CHEMISTRY, and EXPLOSION.

"It is on account of the singular and excellent natural qualities of this metal (says our author), which are considerably heightened by its scarcity, that gold is so much valued among all the civilized nations of the world." Mr Paucelon, in his *Metrologie*, p. 94. says,

that one cubic foot (French measure) of gold is worth 2,153,000 *livres tournoises*, or 89,708 guineas and seven shillings, supposing the *Louis d'Or* to be equal to the guinea; and that the respective value of the same cubic foot of gold is equal to 25.6 cubic feet of silver; each of this last metal being reckoned worth about 84,000 French livres, or 3503 guineas and eight shillings: so that if we suppose the monied specie in France to be but two *milliards* of French livres, according to the estimation of Mr Neckar in his Treatise upon the Commerce of Corn, the whole amount should make but a solid cube of gold less than 10 feet on each side. So trifling is the physical object that excites the activity of 22 millions of the human species, the number that is said to be that of the inhabitants of France.

We shall close this article with some observations by M. Magellan on the state in which gold is found in the bowels of the earth, and consequently of the origin of gold ores. "As to the natural existence of gold in the bowels of the earth (says he), there have been two opinions among mineralogists; some pretending that it is only found in its *metallic* or *native* form; and others, that it is sometimes found *mineralized* in an intimate union with other substances. Mr Kirwan holds the former, and the celebrated Bergman the latter. But, says Mr Kirwan, 'though Mr Bergman inclines to the opinion of the mineralization, yet he is candid enough to own, that the gold, when extracted from this ore, is of a granular or angular form. It is therefore very doubtful, whether it was not rather *mixed*, than truly combined with the sulphur and iron: and its proportion being exceedingly small, so that 100 pounds of the pyrites scarcely contain an ounce of gold, it is not a wonder that it should escape the action of aqua regia; more especially as the nitrous acid becomes so phlogisticated by acting on the pyrites, as not to be able to dephlogisticate the marine. Likewise mercury, by reason of the gold particles being enveloped in the sulphureous iron, can have no access to it.'

"These arguments (says M. Magellan) against the true mineralization of gold, are fully answered by the facts already mentioned. Besides, it is well known, that gold can be combined and calcined, *via sicca*, by the liver of sulphur and semimetals. This being acknowledged on both sides of the question, why should we insist on denying this mineralization, when it is out of doubt, among mineralogists of rank, that volcanic fires have had a great share in the convulsions and revolutions of this globe, of which every one has the most convincing proofs almost every where. The account given by Mr Hacquet of the gold mines at Nagy-ag in Transylvania, the ancient Dacia, which lies about 45° latitude, offers the most convincing proofs of this assertion. The country all round these mines bears an incontestable appearance of being a volcanic one; and among various other metals, there are at least 13 kinds of gold ores, most of them mineralized. These are, 1. Gold mineralized by sulphur, zinc, and arsenic, in a grey-yellowish volcanic ore, which is called *cottoners*, or cotton-ore, on account of its lightness and texture. 2. By iron and arsenic, formed by strata; one containing black silver ore, then spatum, galena, quartz, and grey gold ore: it yields about half an ounce in the 100 pounds. 3. By sulphur, antimo-

Gold.

ny, zinc, some arsenic, and sometimes iron: this is a grey gold ore mixed with some quartz. 4. In the form of crooked threads mixed with quartz and gypseous spath; a poor mine. 5. Dendritiform, like the mocho stone, or the agate from Aberstein in the Palatinate; but these black dendrites are in a reddish stone. 6. Amorphous, very compact, in small grains, with spath and quartz. A quintal of it yields two ounces of gold, and more of silver. 7. By sulphur, great part of zinc, and a little antimony and arsenic; not rich. 8. Of a black or dark-reddish colour, containing an auriferous pyrites; not rich. 9. Of a bluish colour, mineralized by sulphur, antimony, iron, and a little arsenic mixed with silver; very rich in gold. 10. Partly laminated with needles of a blackish yellow colour: this gives 66 ounces of gold per $\frac{1}{10}$ of gold, according to Scopoli. 11. Foliated with gypseous spath and yellow pyrites. 12. In irregular lamina, on a greyish argille. The gold looks like silver, and is surrounded by spars of a pale rosy colour. 13. In crystallized laminæ from two to four lines diameter, of an hexangular form, and very much resembling *molybdæna*. The vein was lost for some time, but lately found again on mining for letting out water from the main. This ore is very rare, and has given 372 ounces per $\frac{1}{10}$ of a mixed metal; five of which were gold, and one silver.

Method of Recovering Gold from Gilt Works. The solubility of gold, and the indissolubility of silver, in aqua regia, affords a principle on which gold may be separated from the surface of silver; and, on this foundation, different processes have been contrived, of which the two following appear to be the best.—Some powdered sal ammoniac, moistened with aquafortis into the consistence of a paste, is spread upon the gilt silver, and the piece heated till the matter smokes and becomes nearly dry: being then thrown into water, it is rubbed with a scratch brush composed of fine brass-wire bound together, by which the gold easily comes off. The other way is, by putting the gilt silver into common aqua regia, kept so hot as nearly to boil, and turning the metal frequently till it becomes all over black: it is then to be washed with a little water, and rubbed with the scratch brush, to get off what gold the aqua regia may have left. This last method appears preferable to the other; as the same aqua regia may be made to serve repeatedly till it becomes saturated with the gold, after which the gold may be recovered pure by precipitation with solution of vitriol, as directed under the article METALLURGY.

For separating gold from gilt copper, some direct a solution of borax to be applied on the gilt parts, but nowhere else, with a pencil, and a little powdered sulphur to be sprinkled on the places thus moistened; the principal use of the solution of borax seems to be to make the sulphur adhere; the piece being then made red hot, and quenched in water, the gold is said to be so far loosened, as to be wiped off with a brush. Others mix the sulphur with nitre and tartar, and form the mixture with vinegar into a paste, which is spread upon the gilt parts.

Schlutter recommends mechanical means, as being generally the least expensive, for separating gold from the surface both of silver and copper. If the gilt vessel is round, the gold is conveniently got off by turning

N^o 141.

it in a lathe, and applying a proper tool, a skin being placed underneath for receiving the shavings: he says it is easy to collect into two ounces of shavings all the gold of a gilt vessel weighing thrice as many pounds. Where the figure of the piece does not admit of this method, it is to be properly fixed, and scrapers applied of different kinds according to its size and figure; some large, and furnished with two handles, one at each end; others small and narrow, for penetrating into depressed parts. If the gold cannot be got off by either of these ways, the file must be had recourse to, which takes off more of the metal underneath than the turning tool or the scraper, particularly than the former. The gold scrapings or filings may be purified from the silver or copper they contain, by the methods described under the article METALLURGY.

The editors of the *Encyclopédie* give a method of recovering the gold from wood that has been gilt on a water-size: this account is extracted from a memoir on the same subject, presented to the Academy of Sciences by M. de Montamy. The gilt wood is steeped for a quarter of an hour in a quantity of water sufficient to cover it, made very hot: the size being thus softened, the wood is taken out, and scrubbed, piece by piece, in a little warm water, with short stiff bristle brushes of different sizes, some small for penetrating into the carvings, and others large for the greater dispatch in flat pieces. The whole mixture of water, size, gold, &c. is to be boiled to dryness, the dry matter made red hot in a crucible to burn off the size, and the remainder ground with mercury, either in a mortar, or, where the quantity is large, in a mill.

GOLD-Coast. See GUINEA.

GOLD-Wire, a cylindrical ingot of silver, superficially gilt or covered with gold at the fire, and afterwards drawn successively through a great number of little round holes, of a wire-drawing iron, each less than the other, till it be sometimes no bigger than a hair of the head. See *WIRE-Drawing*.

It may be observed that, before the wire be reduced to this excessive fineness, it is drawn through above 140 different holes; and that each time they draw it, it is rubbed afresh over with new wax, both to facilitate its passage, and to prevent the silver's appearing through it.

GOLD-Wire flattened, is the former wire flattened between two rollers of polished steel, to fit it to be spun on a stick, or to be used flat, as it is, without spinning, in certain stuffs, laces, embroideries, &c. See STUFF, &c.]

GOLD-Thread, or *Spun-gold*, is flattened gold, wrapped or laid over a thread of silk, by twisting it with wheel and iron-bobbins.

To dispose the wire to be spun on silk, they pass it between two rollers of a little mill: these rollers are of nicely polished steel, and about three inches in diameter. They are set very close to each other, and turned by means of a handle fastened to one of them, which gives motion to the other. The gold wire in passing between the two is rendered quite flat, but without losing any thing of its gilding; and is rendered so exceedingly thin and flexible, that it is easily spun on silk-thread, by means of a hand-wheel, and so wound on a spool or bobbin. See *WIRE-Drawing*.

5

GOLD-

Gold.

Gold.

Gold-Leaf, or Beaten Gold, is gold beaten with a hammer into exceeding thin leaves, so that it is computed, that an ounce may be beaten into 1600 leaves, each three inches square, in which state it takes up more than 159,052 times its former surface. See *Gold-Leaf*.

It must be observed, however, that gold is beaten more or less, according to the kind or quality of the work it is intended for; that for the gold-wire drawers to gild their ingots withal, is left much thicker than that for gilding the frames of pictures, &c. See *GILDING*.

GOLD-Brocade. See *BROCADE*.

Fulminating-GOLD. See *CHEMISTRY*, n° 1103.

Mosaic GOLD, is gold applied in pannels on a proper ground, distributed into squares, lozenges, and other compartments; part of which is shadowed to raise or heighten the rest. See *MOAIC*.

GOLD Plates for Enamelling are generally made of ducat gold, whose fineness is from $23\frac{1}{2}$ to $23\frac{3}{4}$ carats; and the finest gold is the best for this purpose, unless where some parts of the gold are left bare and unpolished, as in watch-cases, snuff-boxes, &c. for which purpose a mixture of alloy is necessary, and silver is preferred to copper, because the latter disposes the plates to tarnish and turn green. See *ENAMELLING*.

Shell-GOLD, is that used by the gilders and illuminers, and with which gold letters are written. It is made by grinding gold leaves, or gold-beaters fragments, with a little honey, and afterwards separating the honey from the powdered gold by means of water. When the honey is washed away, the gold may be put on paper or kept in shells; whence its name. When it is used, it is diluted with gum-water or soap-suds. The German gold-powder, prepared from the Dutch gold-leaf in the same manner, is generally used; and when it is well scoured with varnish, answers the end in japanners gilding as well as the genuine.

GOLD-Size for burnished gilding is prepared of one pound and an half of tobacco-pipe clay, half an ounce of red chalk, a quarter of an ounce of black lead, forty drops of sweet oil, and three drams of pure tallow: grind the clay, chalk, and black lead, separately, very fine in water; then mix them together, add the oil and tallow, and grind the mixture to a due consistence.

Gold-size of japanners may be made by pulverizing gum animi and asphaltum, of each one ounce; red-lead, litharge of gold, and umbre, of each one ounce and a half, mixing them with a pound of linseed-oil, and boiling them, observing to stir them till the whole be incorporated, and appears on growing cold of the consistence of tar: strain the mixture through a flannel, and keep it stopped up in a bottle for use. When it is used, it must be ground with as much vermilion as will give it an opaque body, and diluted with oil of turpentine, so that it may be worked freely with the pencil. A simple preparation consists of one pound of linseed oil and four ounces of gum animi; powder the gum, and mix it gradually with the boiling oil; let it continue to boil till it becomes of the consistence of tar; strain it through a coarse cloth; keep and use it as the other.

GOLD-Finch, in ornithology. See *FRINGILLA*.

These are seed-birds of very curious colours, and which, were they not so common in this country, would probably be very much esteemed.

VOL. VIII. Part I.

Golden.

They are usually taken about Michaelmas, and soon become tame; but they differ very much in their song. — They frequently breed in the upper part of plum-trees, making their nests of the moss that grows upon apple-trees, and of wool; quilting the inside with all sorts of hairs they find upon the ground. They breed three times a-year; and the young are to be taken with the nest at about ten days old, and fed as follows:— Pound some hemp-seed very fine in a mortar; then sift it through a sieve, and add to it as much wheat-bread as hemp-seed; and likewise a little flour of canary-seeds: then with a small stick or quill take up as much as the bigness of a white-pea, and give them several times a-day. This ought to be made fresh every day: for if it is suffered to sour, it will spoil their stomachs, causing them to cast up their meat; which if they do, it is very probable that they will die.— These young birds must be carefully kept warm till they can feed themselves, for they are very tender. In feeding, be sure to make your bird clean his bill and mouth. If any of the meat falls upon his feathers, take it off, or else he will not thrive. Such as eat hemp-seed, to purge them, should have the seeds of melons, succory, and mercury; or else let them have lettuce and plantane for that purpose. When there is no need of purging, give them two or three times a-week a little sugar or loam in their meat, or at the bottom of the cage; for all seeds have an oiliness, so that if they have not something to absorb it, in length of time it fouls their stomachs, and brings on them a flux, which is very dangerous.

GOLD-Fish. See *CYPRINUS*.

GOLDEN, something that has a relation to gold, or consists of gold.

GOLDEN-Calf, was a figure of a calf, which the Israelites cast in that metal, and set up in the wilderness to worship during Moses's absence into the mount; and which that legislator at his return burnt, grinded to powder, and mixed with the water the people were to drink of; as related in Exod. xxxii. The commentators have been divided on this article: the pulverizing of gold, and rendering it potable, is a very difficult operation in chemistry. Many, therefore, suppose it done by a miracle: and the rest, who allow of nothing supernatural in it, advance nothing but conjectures as to the manner of the process. Moses could not have done it by simple calcination, nor amalgamation, nor antimony, nor calcination; nor is there one of those operations that quadrates with the text.

M. Stahl has endeavoured to remove this difficulty. The method Moses made use of, according to this author, was by dissolving the metal with hepar sulphuris; only, instead of the vegetable alkali, he made use of the Egyptian natron, which is common enough throughout the east. See *CHEMISTRY*, n° 1127.

GOLDEN Fleece, in the ancient mythology, was the skin or fleece of the ram upon which Phryxus and Hella are supposed to have swam over the sea to Colchis; and which being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoof'd bulls, and a monstrous dragon that never slept; but was taken and carried off by Jason and the Argonauts.

Many authors have endeavoured to show that this fable is an allegorical representation of some real history,

Golden tory, particularly of the philosopher's stone. Others have explained it by the profit of the wool-trade to Colchis, or the gold which they commonly gathered there with fleeces in the rivers. See ARGONAUTS.

Goldsmith.

Order of the GOLDEN Fleece, is a military order instituted by Philip the Good, duke of Burgundy, in 1429. It took its denomination from a representation of the golden fleece, borne by the knights on their collars, which consisted of flints and steels. The king of Spain is now grand master of the order, in quality of duke of Burgundy: the number of knights is fixed to thirty-one.

It is usually said to have been instituted on occasion of an immense profit which that prince made by wool; though others will have a chemical mystery couched under it, as under that famous one of the ancients, which the adepts contend to be no other than the secret of the elixir, wrote on the fleece of a sheep.

Oliver de la Marche writes, that he had suggested to Philip I. archduke of Austria, that the order was instituted by his grandfather Philip the Good duke of Burgundy, with a view to that of Jason; and that John Germain bishop of Chalons, chancellor of the order, upon this occasion made him change his opinion, and assured the young prince that the order had been instituted with a view to the fleece of Gideon. William bishop of Tournay, chancellor likewise of the order, pretends that the duke of Burgundy had in view both the golden fleece of Jason and Jacob's fleece, *i. e.* the speckled sheep belonging to this patriarch, according to agreement made with his father-in-law Laban. Which sentiment gave birth to a great work of this prelate, in two parts: in the first, under the symbol of the fleece of Jason, is represented the virtue of magnanimity, which a knight ought to possess; and under the symbol of the fleece of Jacob he represents the virtue of justice.

Paradin is of the same mind; and tells us, that the duke designed to insinuate that the fabulous conquest which Jason is said to have made of the golden fleece in Colchis, was nothing else but the conquest of virtue, which gains a victory over those horrible monsters vice and our evil inclinations.

GOLDEN Number, in chronology, a number showing what year of the moon's cycle any given year is. See CHRONOLOGY, n° 27—30.

GOLDEN Rod, in botany. See SOLIDAGO.

GOLDEN Rose. The pope annually consecrates a golden rose on the fourth Sunday in Lent, which is sent to princesses, or to some church, as a mark of his peculiar affection.

GOLDEN Rule, in arithmetic, a rule or praxis, of great use and extent in the art of numbers; whereby we find a fourth proportional to three quantities given.

The golden rule is also called the *Rule of Three* and *Rule of Proportion*. See its nature and use under the article ARITHMETIC, n° 13.

GOLDENGLEN, a town of Poland in the duchy of Courland, with a handsome castle, seated on the river Weia, in E. Long. 22. 31. N. Lat. 56. 48.

GOLDSMITH, or, as some choose to express it, *silversmith*, an artist who makes vessels, utensils, and ornaments, in gold and silver.

The goldsmith's work is either performed in the

mould, or beat out with the hammer or other engine. Goldsmiths. All works that have raised figures are cast in a mould, and afterwards polished and finished: plates or dishes, of silver or gold, are beat out from thin flat plates; and tankards, and other vessels of that kind, are formed of plates soldered together, and their mouldings are beat, not cast. The business of the goldsmiths formerly required much more labour than it does at present; for they were obliged to hammer the metal from the ingot to the thinness they wanted: but there are now invented flattening mills, which reduce metals to the thinness that is required, at a very small expence. The goldsmith is to make his own moulds; and for that reason ought to be a good designer, and have a taste in sculpture: he also ought to know enough of metallurgy to be able to assay mixed metals, and to mix the alloy.

The goldsmiths in London employ several hands under them for the various articles of their trade: such are the jeweller, the snuff box and toy maker, the silver-turner, the gilder, the burnisher, the chaser, the refiner, and the gold-beater.

Goldsmiths are superior tradesmen: their wares must be assayed by the wardens of the company of this name in London, and marked; and gold is to be of a certain touch. No goldsmith may take above one shilling the ounce of gold, besides what he has for the fashioning, more than the buyer may be allowed for it at the king's exchange; and here any false metal shall be seized and forfeited to the king. The cities of York, Exeter, Bristol, &c. are places appointed for the assaying wrought-plate of goldsmiths; also a duty is granted on silver-plate of sixpence an ounce, &c. Plate made by goldsmiths shall be of a particular fineness, on pain of forfeiting 10*l.*; and if any parcel of plate sent to the assayers is discovered to be of a coarser alloy than the respective standards, it may be broken and defaced; and the fees for assaying are particularly limited.

GOLDSMITH (Oliver), a celebrated English writer, was born at Roscommon in Ireland in the year 1731. His father, who possessed a small estate in that county, had nine sons, of whom Oliver was the third. He was originally intended for the church; and with that view, after being well instructed in the classics, was, with his brother the Rev. Henry Goldsmith, placed in Trinity-college, Dublin, about the latter end of the year 1749. In this seminary of learning he continued a few years, when he took a bachelor's degree: but his brother not being able to obtain any preferment after he left the college, Oliver, by the advice of Dean Goldsmith of Cork, turned his thoughts to the study of physic; and, after attending some courses of anatomy in Dublin, proceeded to Edinburgh in the year 1751, where he studied the several branches of medicine under the different professors in that university. His beneficent disposition soon involved him in unexpected difficulties; and he was obliged precipitately to leave Scotland, in consequence of engaging himself to pay a considerable sum of money for a fellow-student.

A few days after, about the beginning of the year 1754, he arrived at Sunderland, near Newcastle, where he was arrested at the suit of a taylor in Edinburgh, to whom he had given security for his friend.

By

Goldsmith. By the good offices of Laughlin Maclane, Esq; and Dr Sleigh, who were then in the college, he was soon delivered out of the hands of the bailiff; and took his passage on board a Dutch ship to Rotterdam, where, after a short stay, he proceeded to Brussels: he then visited great part of Flanders; and after passing some time at Strasbourg and Louvain, where he obtained a degree of bachelor of physic, he accompanied an English gentleman to Berne and Geneva.

It is undoubtedly fact, that this ingenious unfortunate man travelled on foot most part of his tour. He had left England with very little money; and being of a philosophical turn, and at that time possessing a body capable of sustaining every fatigue, and a heart not easily terrified at danger, he became an enthusiast to the design he had formed of seeing the manners of different countries. He had some knowledge of the French language and of music, and he played tolerably well on the German flute; which, from an amusement, became at some times the means of subsistence. His learning produced him a hospitable reception at most of the religious houses; and his music made him welcome to the peasants of Flanders and other parts of Germany. "Whenever I approached," he used to say, "a peasant's house towards night-fall, I played one of my most merry tunes; and that procured me not only a lodging, but subsistence for the next day: but in truth (his constant expression) I must own, whenever I attempted to entertain persons of a higher rank, they always thought my performance odious, and never made me any return for my endeavours to please them."

On Mr Goldsmith's arrival at Geneva, he was recommended as a proper person for a travelling tutor to a young man, who had been unexpectedly left a considerable sum of money by his uncle Mr S——, formerly an eminent pawnbroker near Holborn. This youth, who had been articled to an attorney, on receipt of his fortune determined to see the world; and, on his engaging with his preceptor, made a proviso that he should be permitted to govern himself; and Goldsmith soon found his pupil understood the art of directing in money-concerns extremely well, as avarice was his prevailing passion. His questions were usually how money might be saved, and which was the least expensive course of travel; whether any thing could be bought that would turn to account when disposed of again in London? Such curiosities on the way as could be seen for nothing he was ready enough to look at; but if the sight of them was to be paid for, he usually asserted that he had been told they were not worth seeing. He never paid a bill that he would not observe how amazingly expensive travelling was; and all this, though he was not yet twenty-one. During Goldsmith's continuance in Switzerland, he assiduously cultivated his poetical talent, of which he had given some striking proofs while at the college of Edinburgh. It was here he sent the first sketch of his delightful poem called the *Traveller* to his brother the clergyman in Ireland, who, giving up fame and fortune, had retired with an amiable wife to happiness and obscurity, on an income of only 40 l. a-year.

From Geneva Mr Goldsmith and his pupil visited the south of France; where the young man, upon

some disagreement with his preceptor, paid him the small part of his salary which was due, and embarked at Marseilles for England. Our wanderer was left once more upon the world at large, and passed through a variety of difficulties in traversing the greatest part of France. At length his curiosity being satiated, he bent his course towards England, and arrived at Dover the beginning of the winter 1758. When he came to London, his stock of cash did not amount to two livres. An entire stranger in this metropolis, his mind was filled with the most gloomy reflections on his embarrassed situation. With some difficulty he discovered that part of the town in which his old acquaintance Dr Sleigh resided. This gentleman received him with the warmest affection, and liberally invited him to share his purse till some establishment could be procured for him. Goldsmith, unwilling to be a burden to his friend, a short time after eagerly embraced an offer which was made him to assist the late Rev. Dr Milner in instructing the young gentlemen at the academy at Peckham; and acquitted himself greatly to the Doctor's satisfaction for a short time: but having obtained some reputation by the criticisms he had written in the Monthly Review, Mr Griffith, the proprietor, engaged him in the compilation of it; and, resolving to pursue the profession of writing, he returned to London, as the mart where abilities of every kind were sure of meeting distinction and reward. As his finances were by no means in a good state, he determined to adopt a plan of the strictest economy; and took lodgings in an obscure court in the Old Bailey, where he wrote several ingenious little pieces. The late Mr Newberry, who at that time gave great encouragement to men of literary abilities, became a kind of patron to our young author; and introduced him as one of the writers in the Public Ledger, in which his *Citizen of the World* originally appeared, under the title of *Chinese Letters*.

Fortune now seemed to take some notice of a man she had long neglected. The simplicity of his character, the integrity of his heart, and the merit of his productions, made his company very acceptable to a number of respectable families; and he emerged from his shabby apartments in the Old Bailey to the politer air of the Temple, where he took handsome chambers, and lived in a genteel style. The publication of his *Traveller*, and his *Vicar of Wakefield*, was followed by the performance of his comedy of the *Good-natured Man* at Covent-Garden theatre, and placed him in the first rank of the poets of the present age.

Among many other persons of distinction who were desirous to know him, was the duke of Northumberland; and the circumstance that attended his introduction to that nobleman is worthy of being related, in order to show a striking trait of his character. "I was invited," said the Doctor (as he was then universally called) "by my friend Mr Piercy, to wait upon the duke, in consequence of the satisfaction he had received from the perusal of one of my productions. I dressed myself in the best manner I could; and, after studying some compliments I thought necessary on such an occasion, proceeded to Northumberland-house, and acquainted the servants that I had particular business with his Grace. They showed me into an antichamber; where, after waiting some time, a

Goldsmith. gentleman very genteely dressed made his appearance. Taking him for the duke, I delivered all the fine things I had composed in order to compliment him on the honour he had done me: when, to my great astonishment, he told me I had mistaken him for his master, who would see me immediately. At that instant the duke came into the apartment; and I was so confused on the occasion, that I wanted words barely sufficient to express the sense I entertained of the duke's politeness, and went away extremely chagrined at the blunder I had committed."

Another feature of his character we cannot help laying before the reader. Previous to the publication of his *Deserted Village*, the bookseller had given him a note for one hundred guineas for the copy, which the Doctor mentioned a few hours after to one of his friends: who observed, it was a very great sum for so short a performance. "In truth," replied Goldsmith, "I think so too; I have not been easy since I received it; therefore I will go back and return him his note:" which he absolutely did; and left it entirely to the bookseller to pay him according to the profits produced by the sale of the piece, which turned out very considerable.

During the last rehearsal of his comedy intitled *She stoops to Conquer*, which Mr Coleman had no opinion would succeed, on the Doctor's objecting to the repetition of one of Tony Lumpkin's speeches, being apprehensive it might injure the play, the manager with great keenness replied, "Psha, my dear Doctor, do not be fearful of squibs, when we have been sitting almost these two hours upon a barrel of gunpowder." The piece, however, contrary to Mr Coleman's expectation, was received with uncommon applause by the audience; and Goldsmith's pride was so hurt by the severity of the above observation, that it entirely put an end to his friendship for the gentleman that made it.

Notwithstanding the great success of his pieces, by some of which it is asserted, upon good authority, he cleared 1800*l.* in one year, his circumstances were by no means in a prosperous situation; which was partly owing to the liberality of his disposition, and partly to an unfortunate habit he had contracted of gaming; the arts of which he knew very little of, and consequently became the prey of those who were unprincipled enough to take advantage of his simplicity.

Just before his death he had formed a design for executing an *Universal Dictionary of Arts and Sciences*, the prospectus of which he actually published. In this work several of his literary friends (particularly Sir Joshua Reynolds, Dr Johnson, Mr Beauclerc, and Mr Garrick) had undertaken to furnish him with articles upon different subjects. He had entertained the most sanguine expectations from the success of it. The undertaking, however, did not meet with that encouragement from the booksellers which he had imagined it would undoubtedly receive; and he used to lament this circumstance almost to the last hour of his existence.

He had been for some years afflicted, at different times, with a violent strangury, which contributed not a little to embitter the latter part of his life; and which, united with the vexations which he suffered upon other occasions, brought on a kind of habitual

despondency. In this unhappy condition he was attacked by a nervous fever, which, being improperly treated, terminated in his dissolution on the 4th of April 1774.

As to his character, it is strongly illustrated by Mr Pope's line,

In wit a man, simplicity a child.

The learned leisure he loved to enjoy was too often interrupted by distresses which arose from the liberality of his temper, and which sometimes threw him into loud fits of passion: but this impetuosity was corrected upon a moment's reflection; and his servants have been known, upon these occasions, purposely to throw themselves in his way, that they might profit by it immediately after; for he who had the good fortune to be reproved, was certain of being rewarded for it. The universal esteem in which his poems were held, and the repeated pleasure they give in the perusal, is a striking test of their merit. He was a studious and correct observer of nature; happy in the selection of his images, in the choice of his subjects, and in the harmony of his versification; and, though his embarrassed situation prevented him from putting the last hand to many of his productions, his *Hermit*, his *Traveller*, and his *deserted Village*, bid fair to claim a place among the most finished pieces in the English language.

Besides the works already mentioned, he wrote, 1. *History of the earth and animated nature*, 6 vols 8vo. 2. *History of England*, 4 vols 8vo. 3. *History of Rome*, 2 vols. 4. *Abridgements of the two last*, for the use of schools. 5. *A view of experimental philosophy*, 3 vols 8vo.; a posthumous work, not esteemed. 6. *Miscellanies*, &c.

GOLF, the name of a certain game among the Scots, and said to be peculiar to their country. Among them it has been very ancient; for there are statutes prohibiting it as early as the year 1457, lest it should interfere with the sport of archery. It is commonly played on rugged broken ground, covered with short grass, in the neighbourhood of the sea-shore. A field of this sort is in Scotland called *links*. The game is generally played in parties of one or two on each side. Each party has an exceeding hard ball, somewhat larger than a hen's egg. This they strike with a slender and elastic club, of about four feet long, crooked in the head, and having lead run into it, to make it heavy. The ball being struck with this club, will fly to the distance of 200 yards, and the game is gained by the party who puts his ball into the hole with the fewest strokes. But the game does not depend solely upon the striking of the longest ball, but also upon measuring the strength of the stroke, and applying it in such direction as to lay the ball in smooth ground, whence it may be easily moved at the next stroke. To encourage this amusement, the city of Edinburgh, A. D. 1744, gave to the company of golfers a silver club, to be played for annually by the company, the victor to append a gold or silver piece to the prize. It has been played for every year since, except the years 1746, 1747. For their better accommodation, 22 members of the company subscribed L. 30 each in the year 1768, for building a house, where their meetings might be held. The spot chosen for this purpose was the southwest corner of Leith links, where

Golius,
Goltzius.

an area was taken in feu from the magistrates of Edinburgh, and a commodious house and tavern built upon it.

GOLIUS (James), a celebrated professor of Arabic and the mathematics at Leyden, was descended from a very honourable family, and born at the Hague in the year 1596. He was put to the university of Leyden, where he studied under Erpinus; and having made himself master of all the learned languages, applied himself to the mathematics, physic, and divinity. He afterwards travelled into Africa and Asia; and became greatly esteemed by the king of Morocco, and the sultan of the Turks. He at length returned to Leyden, loaded with manuscripts; and in 1624, succeeded Erpinus in the Arabic chair. As he had been an eye-witness of the wretched state of Christianity in the Mahometan countries, he was filled with the compassion of a fellow-christian; and none ever solicited for a place of honour and profit with greater eagerness, than he for procuring a new edition of the New Testament, in the original language, with a translation into the vulgar Greek, by an Archimandrite; and as there are some of these Christians who use the Arabic tongue in divine service, he also took care to have dispersed among them an Arabic translation of the Confession of the Protestants, together with the Catechism and Liturgy. In 1626, he was also chosen professor of mathematics; and discharged the functions of both professorships with the greatest applause during 40 years. He was likewise appointed interpreter in ordinary to the states for the Arabic, Turkish, Persian, and other eastern languages, for which he had an annual pension, and a present of a gold chain, with a very beautiful medal, which he wore as a badge of his office. He published, 1. The life of Tamerlane, written in Arabic. 2. The history of the Saracens, written by Elmacin. 3. Alferganus's elements of Astronomy, with a new version, and learned commentaries. 4. An excellent Arabic lexicon. 5. A Persian Dictionary. He died in 1667.

GOLTZIUS (Henry), a famous engraver and painter, born in 1558, at Mulbreck in the duchy of Juliers. He was taught the art of engraving by Theodore Cuerehert; and succeeded very wonderfully in it, notwithstanding the disadvantage of a lame hand, which was occasioned by his falling into the fire whilst young. He was first employed by his master, and afterwards he worked for Philip Galle. Domestic troubles and ill health occasioned him to travel. He went through Germany into Italy; and passed under a feigned name, that his studies might not be interrupted. He visited Bologna, Florence, Naples, and Venice, constantly applying himself to drawing from the antique statues, and the works of the great masters. At Rome he resided the longest; and there he produced several excellent engravings from Polidoro Raphael, and other eminent painters. On his return to his native country he established himself at Haerlem, where he engraved many of the drawings which he had made during his abode in Italy. He died at Haerlem in 1617, aged 59. He is said to have been forty years old before he began to paint: yet his pictures are spoken of with the greatest commendation; but as he did not produce any great number of them, they are of course but rarely to be met with. As an engraver, he de-

serves the highest commendation. No man ever surpassed, and few have equalled, him in the command of the graver and freedom of execution. He copied the style of Albert Durer, Lucas of Leyden, and other old masters, with astonishing exactness. Sometimes his engravings are neat in the extreme; at other times they are performed in a bold open manner, without the least restraint. He also engraved several of his own designs on wood, in that manner which is distinguished by the appellation of *chiaro-scuro*. Of his prints, which are very numerous, it may here suffice to specify two or three of the most celebrated: 1. Six large upright plates, known by the name of his *master-pieces*. These, it is said, he engraved to convince the public that he was perfectly capable of imitating the styles of Albert Durer, Lucas Van Leyden, and other masters, whose works were then held in higher estimation than his own: for he had adopted a new manner, which he pursued because he thought it superior, and not because he was incapable of following the others. It is reported that with one of them, the Circumcision, which he smoked to give it the more plausible air of antiquity, he actually deceived some of the most capital connoisseurs of the day; by one of whom it was bought for an original engraving of Albert Durer. The subjects of these plates are, The Annunciation of the Virgin; the Meeting of the Virgin with Elizabeth, called the Visitation; the Nativity of Christ; the Circumcision of Christ; the Adoration of the wise Men; the holy Family. 2. The Judgement of Midas, a large plate lengthwise. 3. The Venetian Ball, a large plate lengthwise, from Theodore Bernard. 4. The Boy and Dog, a middling sized upright plate, from a design of his own; an admirable print. 5. The Necromancer, a middling sized upright oval print, in *chiaro-scuro*. 6. Night in her Chariot, the same.

GOLTZIUS (Hubert), a learned German, born at Venlo in the duchy of Gueldres in 1526. His father was a painter, and himself was bred to the art under Lambert Lombard: but he did little at painting, or at least his pictures are very scarce; for having a peculiar turn to antiquities, he devoted himself to the study of medals. He travelled through Germany, France, and Italy, to make collections, as well as to draw from thence all the lights he could towards clearing up ancient history: he was the author of several excellent works, in which he was so accurate and nice, that he had them printed at his own house, under his own correction, and even engraved the plates and medals with his own hand. His veneration for Roman antiquities was so great, that he gave all his children Roman names: and married, for his second wife, the widow of the antiquarian Martinus Smetius; probably more for the sake of Smetius's medals and inscriptions, than for his own sake; and was punished accordingly by her plaguing him all his life, if she did not shorten it. He died in 1583.

GOMBAULD (John Ogier de), one of the best French poets in the 17th century, and one of the first members of the French academy, was born at St Just de Lussac. He acquired the esteem of Mary de Medicis, and of the wits of his time. He was a Protestant, and died in a very advanced age. He wrote

many

Gombroon. many works in verse and prose. His epigrams, and some of his sonnets, are particularly esteemed.

GOMBROON, by the natives called *Bander Abassi*, a city of Persia, situated in N. Lat. 27. 40. E. Long. 55. 30. The name of *Gombroon*, or *Comerong*, Captain Hamilton tells us, it had from the Portuguese; because it was remarkable for the number of prawns and shrimps caught on its coasts, by them called *come-rong*. This city owes its wealth and grandeur to the demolition of Ormus, and the downfall of the Portuguese empire in the East Indies. It is now justly accounted one of the greatest marts in the East, was built by the great shah Abas, and from him, as some think, obtained the name of *Bander Abassi*, which signifies the court of Abas. It stands on a bay about nine leagues to the northward of the east end of the island of Kishmish, and three leagues from the famous Ormus. The English began to settle here about the year 1631, when, in consideration of their services against the Portuguese, shah Abas granted them half the customs of that port. This was confirmed by a phirmaund; and duly regarded, till the English began to neglect the services they had stipulated. Whether the company has any emolument from the customs at present, is what we cannot pretend to ascertain. The town is large, but its situation bad; wanting almost every thing that contributes to the happiness and even support of life. Towards the land it is encompassed by a sort of wall; and towards the sea are several small forts, with a platform, and a castle or citadel, mounted with cannon to secure it and the road from the attempts of an enemy by sea. The houses in most of the streets are so out of repair, some half down, others in a heap of rubbish, that a stranger would imagine the town had been sacked and ravaged by a barbarous people; not a vestige of the wealth really contained in the place appearing in view. The bazars and shops round them are kept, for the most part, by Banians, whose houses are generally in good order. Most of the houses are built with earth and lime, but some of the best with stone. Many of them have a sort of ventilators at top, which contribute greatly to the health of the inhabitants in the hot seasons of the year. The most sickly months here are April, May, September, and October. With fish and mutton the inhabitants are well supplied. Rice is imported from India; and wheat is so plenty, that the poor subsist chiefly on bread and dates. The country hereabouts abounds in the most delicious fruits, as apricots, peaches, pomegranates, pears, mangoes, grapes, quavas, plums, sweet quinces, and water-melons. The apricots, however, are small, and extremely dangerous if eaten to excess.

Those conveniences are more than overbalanced by the scarcity of fresh water, with which the inhabitants are supplied from Asseen, a place seven miles distant, there not being a spring or well in the town. Persons of condition keep a camel constantly employed in bringing fresh and wholesome water. Captain Hamilton gives it as his opinion, that one cause of the unwholesomeness of this city is the reflection of the rays of light from a high mountain to the north of it. He says, that when the beams are reflected from this mountain, they almost fire the air, and, for two or

three months in the year, render the situation intolerable. For this reason the people of condition retire into the country, to pass the heats of June, July, and August. The very sea, during this season, is affected, inasmuch that the stench is no less disagreeable than that of putrid carcases; and this is increased by the quantities of shell-fish left on the shore, from which an exhalation arises that tarnishes gold and silver, and is less tolerable than the bilge-water of a tight ship. At Asseen the English factory have a country-house and gardens, to which they retire occasionally. Here they have whole groves of Seville orange-trees, which though not natural to the country, thrive very well, and are always verdant, bearing ripe and green-fruit, with blossoms, all at the same time. They have likewise tanks and ponds of fine fresh-water, with every thing else that can moderate the heat of the climate, and render life agreeable and elegant. About ten miles from Asseen is a place called *Minoa*, where are cold and hot natural baths, reckoned infallible in the cure of all scrophulous disorders, rheumatisms, and other diseases, by bathing.

Gombroon is extremely populous, on account of the commerce carried on by the Dutch and English factories, as well as the natives. The English factory is close by the sea, at some distance from the Dutch, which is a commodious and fine new building. A great part of the company's profits arises from freights. As the natives have not one good ship of their own, and are extremely ignorant of navigation, they freight their goods for Surat, and other Indian marts, in English and Dutch bottoms, at an exorbitant rate. The commodities of the Gombroon market are, fine wines of different kinds, raisins, almonds, kish-mishes, prunellas, dates, pistachio-nuts, ginger, silks, carpets, leather, tutty, galbanum, ammoniac, asa-fetida, tragacanth, with other gums, and a variety of shop medicines. These are in a great measure the produce of Carmania, which they bring to Gombroon in caravans. The English company had once a small factory in the province of Carmania, chiefly for the sake of a fine wool produced there, and used by the hatters. The said company had once a project of carrying a breed of the Persian goats to St. Helena; but whether it was executed, or what success it met with, we cannot say. Although the company pay no customs, yet they usually make a present to the shahbander, to avoid the trouble he has it in his power to give them. All private traders with the company's passes, enjoy the same privileges, on paying *two per cent.* to the company, one to the agent, and one to the broker. All private trade, either by European or country ships, has long been engrossed by the company's servants.

GOMERA, one of the Canary islands lying between Ferro and Teneriffe. It has one good town of the same name, with an excellent harbour, where the Spanish fleet often take in refreshments. They have corn sufficient to supply the inhabitants, with one sugar-work, and great plenty of wine and fruits. It is subject to the Spaniards, who conquered it in 1445. W. Long. 17. 10. N. Lat. 28. 0.

GOMORRAH (anc. geog.), one of the cities of the plain or of the vale of Siddim in Judæa, destroyed to-

Gombroon

Gomorra

Gemozia together with Sodom by fire from heaven, on account of the wickedness of the people. To determine its particular situation at present, is impossible.

||
Gondar.

GOMOZIA, in botany: A genus of the digynia order, belonging to the tetrandria class of plants. The corolla is campanulated, quadrifid above; there is no calyx; the berry is bilocular.

GOMPHOSIS, in anatomy, that kind of articulation by which the teeth are fixed in the jaw-bone. See **ANATOMY**, n° 2.

GOMPHRÆNA, **GLOBE AMARANTH**, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 54th order, *Miscellaneæ*. The calyx is coloured; the exterior one triphyllous, or diphyllous, with two carinated connivent leaflets; the nectarium cylindrical, with ten teeth; the capsule monospermous. There are seven species; but only one of them is commonly cultivated in our gardens, viz. the globosa. It hath an upright stalk branching all round, two or three feet high, garnished with oval, lanceolate, and opposite leaves; and every branch and side-shoot terminated by a close globular head of flowers, composed of numerous, very small starry florets, closely covered with dry scaly calices placed *imbricatum*, persistent, and beautifully coloured purple, white, red, or striped and variegated. The flowers themselves are so small, and closely covered with the scaly calices, that they scarcely appear. The numerous closely placed scaly coverings being of a dry, firm, consistence, coloured and glittering, collected into a compact round head, about the size of an ordinary cherry, make a fine appearance. They are annual plants, natives of India; and require artificial heat to raise and forward them to a proper growth, so that they may flower in perfection, and produce ripe seed. They flower from June to November; and if the flowers are gathered when at full growth, and placed out of the sun, they will retain their beauty several months.

GONAQUA, the name of a nation inhabiting about the Cape, and supposed by Dr Sparman to be a mixture of Hottentots and Caffres. See **HOTTENTOTS**.

GONDAR, the capital of Abyssinia; situated, according to Mr Bruce's observations, in Lat. 12. 34. 30. and Long. 37. 33. 0. E. from Greenwich. It lies upon the top of a hill of considerable height, and consists of about 10,000 families in times of peace. The houses are chiefly of clay, with roofs thatched in the form of cones. At the west end of the town is the king's palace; formerly, as Mr Bruce informs us, a structure of considerable consequence, being a large square building four stories high, flanked with square towers, and affording from the top of it a magnificent view of all the country southward to the lake Tzana. It was built in the time of Facilidas, by masons from India, and by such Abyssinians as had been instructed in architecture by the Jesuits before their expulsion. Great part of it is now in ruins, having been burnt at different times; but there is still ample lodging in the two lowest floors, the audience chamber being above 120 feet long. By the side of this structure, there have been built by different kings apartments of clay only in the fashion of their own country. The palace, with all its contiguous buildings, is surrounded by a double

stone wall thirty feet high and a mile and a half in circumference, with battlements upon the outer wall, and a parapet roof between the outer and inner, by which you can go along the whole and look into the street. The hill on which the town is built rises in the middle of a deep valley, through which run two rivers: one of which, the Kakha, coming from the Mountain of the Sun, flanks all the south of the town; while the other, called the *Angrab*, falling from the Mountain Woggora, encompasses it on the north and north-east; and both rivers unite at the bottom of the hill about a quarter of a mile south of the town. Upon the bank opposite to Gondar, on the other side of the river, is a large town of Mahometans; a great part of whom are employed in taking care of the king's and nobility's equipage both when they take the field and when they return from it. They are formed into a body under proper officers; but never fight on either side, being entirely confined to the occupation just mentioned, in which by their care and dexterity in pitching and striking the tents, and in leading and conducting the baggage-waggons, they are of great service.—The valley of Gondar is described as having three outlets; one south, to Dembea, Matsha, and the Agows; another on the north-west, towards Sennaar, over the Mountain of the Sun; and the third north, leading to Waggora over the high mountain Lamalman, and so on through Tigre to the Red Sea.

GONDI (John Francis Paul), Cardinal de Retz, was the son of Philip Emanuel de Gondi, Count de Joigny, lieutenant-general, &c. and was born in 1613. From a doctor of the Sorbonne, he first became coadjutor to his uncle John Francis de Gondi, whom he succeeded in 1654 as archbishop of Paris; and was finally made a cardinal. This extraordinary person has drawn his own character in his memoirs with impartiality. He was a man who, from the greatest degree of debauchery, and still languishing under its consequences, made himself adored by the people as a preacher. At the age of 23, he was at the head of a conspiracy against the life of Cardinal Richelieu; he precipitated the parliament into cabals, and the people into sedition: he was (says M. Voltaire) the first bishop who carried on a civil war without the mask of religion. However, his intrigues and schemes turned out so ill, that he was obliged to quit France; and he lived the life of a vagrant exile for five or six years, till the death of his great enemy Cardinal Mazarin when he returned on certain stipulated conditions. After assisting in the conclave at Rome, which chose Clement IX. he retired from the world, and ended his life like a philosopher in 1679; which made Voltaire say, that in his youth he lived like Catiline, and like Atticus in his old age. He wrote his *Memoirs* in his retirement; the best edition of which is that of Amsterdam, 4 vols. 12mo. 1719.

GONDOLA, a flat boat, very long and narrow, chiefly used at Venice to row on the canals. The word is Italian, *gondola*. Du Cange derives it from the vulgar Greek *κονήλας*, "a bark," or "little ship;" Lancelot deduces it from *γόνδου*, a term in Athenæus for a sort of vase.

The middle-sized gondolas are upwards of thirty feet long and four broad: they always terminate at each

Gondi,
Gondola.

Gondola each end in a very sharp point, which is raised perpendicularly to the full height of a man.

||
Good.

The address of the Venetian gondoliers, in passing along their narrow canals, is very remarkable: there are usually two to each gondola, and they row by pushing before them. The fore-man rests his oar on the left side of the gondola: the hind-man is placed on the stern, that he may see the head over the tilt or covering of the gondola, and rests his oar, which is very long, on the right side of the gondola.

GONDOLA is also the name of a passage-boat of six or eight oars, used in other parts of the coast of Italy.

GONORRHÆA, an efflux of white, greenish, or differently-coloured, matter from the urethra; most commonly owing to venereal infection. See **MEDICINE**, and **SURGERY**.

GONZAGA (Lucretia), was one of the most illustrious ladies of the 16th century; and much celebrated for her wit, her learning, and her delicate style. Hortensio Lando wrote a beautiful panegyric upon her, and dedicated to her his dialogue of moderating the passions. Her beautiful letters have been collected with the greatest care. We learn from these, that her marriage with John Paul Manfrone was unhappy.—She was married to him when she was not 14 years of age, and his conduct afterwards gave her infinite uneasiness. He engaged in a conspiracy against the duke of Ferrara; was detected and imprisoned by him; but, though condemned by the judges, not put to death. She did all in her power to obtain his enlargement, but in vain; for he died in prison, having shown such impatience under his misfortunes, as made it imagined he had lost his senses. She never would listen afterwards to any proposals of marriage, though several were made to her. All that came from her pen was so much esteemed, that a collection was made even of the notes she writ to her servants; several of which are to be met with in the edition of her letters.

GOOD, in general, whatever is apt to increase pleasure, to diminish pain in us; or, which amounts to the same, whatever is able to procure or preserve to us the possession of agreeable sensations, and remove those of an opposite nature.

Moral Good denotes the right conduct of the several senses and passions, or their just proportion and accommodation, to their respective objects and relations. See **MORALS**.

Good Abearing, (*bonus gestus*), signifies an exact carriage or behaviour of a subject towards the king and the people, whereunto some persons upon their misbehaviour are bound: and he that is bound to this, is said to be more strictly bound than to the peace; because where the peace is not broken, the surety *de bono gestu* may be forfeited by the number of a man's company, or by their weapons.

Good Behaviour, in law, an exact carriage and behaviour to the king and his people.

A justice of the peace may, at the request of another, or where he himself sees cause, demand surety for the good behaviour; and to that end the justice may issue out his warrant against any persons whatsoever, under the degree of nobility; but when it is a nobleman, complaint is to be made in the court of chancery, or king's bench, where such nobleman may

N^o 141.

be bound to keep the peace. Infants and feme-coverts, who ought to find surety by their friends, may be bound over to their good behaviour; as also lunatics, that have sometimes lucid intervals, and all others who break the peace, or being suspected to do it by affrays, assaults, battery, wounding, fighting, quarrelling, threatening, &c. A person may be likewise bound to his good behaviour for a scandalous way of living, keeping bawdy-houses, gaming-houses, &c. and so may common drunkards, whoremongers, common whores, cheats, libellers, &c. He who demands surety for the peace, on any violence offered, must take an oath before the justice, that he goes in fear of his life, or some bodily harm, &c. and that it is not out of malice, but from a regard to his own safety.

Good-Breeding. See **Good-MANNERS**.

Good Friday, a fast of the Christian church, in memory of the sufferings and death of Jesus Christ. It is observed on the Friday in *holy* or *passion week*; and it is called, by way of eminence, *good*, because of the blessed effects of our Saviour's sufferings, which were a propitiatory or expiating sacrifice for the sins of the world. The commemoration of our Saviour's sufferings has been kept from the very first ages of Christianity, and was always observed as a day of the strictest fasting and humiliation. Among the Saxons it was called *Long-Friday*; but for what reason, except on account of the long fastings and offices then used, is uncertain. On Good-Friday the pope sits on a plain form; and, after service is ended, when the cardinals wait on him back to his chamber, they are obliged to keep a deep silence, as a testimony of their sorrow. In the night of Good-Friday, the Greeks perform the obsequies of our Saviour round a great crucifix, laid on a bed of state, adorned with flowers; these the bishops distribute among the assistants when the office is ended. The Armenians, on this day, set open a holy sepulchre, in imitation of that of mount Calvary.

Good-Hope, or *Cape of Good Hope*, a promontory of Africa, where the Dutch have built a good town and fort. It is situated in the country of the Hottentots; for an account of whom, and of the country at large, with its first discovery, see the article **HOTTENTOTS**.

The Cape of Good-Hope has been generally esteemed the most southerly point of Africa, though it is not truly so. In *Phillip's Voyage to Botany Bay**, we are told, that the land which projects farthest to the south is a point to the east of it, called by the English *Cape Lagullus*; a name corrupted from the original Portuguese *das Agulhas*, which, as well as the French appellation *des Aiguilles*, is descriptive of its form, and would rightly be translated *Needle Cape*. p. 38.

On approaching the Cape, a very remarkable eminence may in clear weather be discovered at a considerable distance; and is called the *Table-mountain* from its appearance, as it terminates in a flat horizontal surface, from which the face of the rock descends almost perpendicularly. In the mild or summer season, which commences in September, and continues till March, the Table Land or Mountain, is sometimes suddenly capped with a white cloud, by some called the *spreading of the Table-cloth*. When this cloud seems to roll down the steep face of the mountain, it is a sure indication of an approaching gale of wind from the south-east; which generally blows with great violence, and some-

Good. sometimes continues a day or more, but in common is of short duration. On the first appearance of this cloud, the ships in Table Bay begin to prepare for it, by striking yards and top-masts, and making every thing as snug as possible.—A little to the westward of the Table Land, divided by a small valley, stands on the right hand side of Table Bay a round hill, called the *Sugar Loaf*; and by many the *Lion's Head*, as there is a continuance from it contiguous to the sea, called the *Lion's Rump*; and when you take a general view of the whole, it very much resembles that animal with his head erect. The *Sugar Loaf* or *Lion's Head*, and the *Lion's Rump*, have each a flag-staff on them, by which the approach of ships is made known to the governor, particularising their number, nation, and the quarter from which they come. To the eastward, separated by a small chasm from the Table Land, stands Charles's Mount, well known by the appellation of the *Devil's Tower*, or *Devil's Head*; and so called from the violent gusts of wind supposed to issue from it when it partakes of the cap that covers the Table Land, though these gusts are nothing more than a degree of force the wind acquires in coming through the chasm. When this phenomenon appears in the morning, which is by no means so frequent as in the evening, the sailors have a saying, as the *Devil's Tower* is almost contiguous to the Table Land, that the old gentleman is going to breakfast; if in the middle of the day, that he is going to dinner; and if in the evening, that the cloth is spread for supper. Table-mountain rises about 3567 feet above the level of the sea; the *Devil's Tower*, about 3368; and the *Lion's Head*, 2764. In the neighbourhood of the latter lies *Constantia*, a district consisting of two farms, wherein the famous wines of that name are produced.

The above described high lands form a kind of amphitheatre about the Table-valley, where the Cape-town stands. This is situated at the bottom of the middle height, or Table-mountain; and almost in the centre of the Table Bay, so called from that mountain.—This bay, it is observed in *Phillip's Voyage*, “cannot properly be called a port, being by no means a station of security; it is exposed to all the violence of the winds which set into it from the sea; and is far from sufficiently secured from those which blow from the land. The gusts which descend from the summit of Table-mountain are sufficient to force ships from their anchors, and even violently to annoy persons on the shore, by destroying any tents or other temporary edifices which may be erected, and raising clouds of fine dust, which produce very troublesome effects. A gale of this kind, from the south-east, blew for three days successively when Captain Cook lay here in his first voyage; at which time, he informs us, the *Resolution* was the only ship in the harbour that had not dragged her anchors. The storms from the sea are still more formidable; so much so, that ships have frequently been driven by them from their anchorage, and wrecked at the head of the Bay. But these accidents happen chiefly in the *quaade mousson*, or winter months, from May 14. to the same day of August; during which time few ships venture to anchor here. Our fleet arriving later, lay perfectly unmolested as long as it was necessary for it to remain in this station.

Vol. VIII. Part I.

—False Bay, on the south-east side of the Cape, is more secure than Table Bay during the prevalence of the north-west winds, but still less so in strong gales from the south-east. It is, however, less frequented, being 24 miles of very heavy road distant from Cape Town, whence almost all necessaries must be procured. The most sheltered part of False Bay is a recess on the west side, called *Simon's Bay*.”

The latest and most particular as well as apparently the most just account of the Cape Town, concerning which voyagers have differed very much from one another in their representations, is that given by Mr White in his *Journal of a Voyage to New South Wales*. From the shipping, he observes†, the town appears pleasantly situated,† P. 87. but at the same time small; a deception that arises from its being built in a valley with such stupendous mountains directly behind it. On landing, however, you are surprised, and agreeably disappointed, to find it not only extensive, but well built, and in a good style; the streets spacious, and intersecting each other at right angles with great precision. This exactness in the formation of the streets, when viewed from the Table Land, is observed to be very great. The houses in general are built of stone, cemented together with a glutinous kind of earth which serves as mortar, and afterwards neatly plastered and whitewashed with lime. As to their height they do not in common exceed two stories, on account of the violence of the wind, which at some seasons of the year blows with great strength and fury. For the same reason thatch has been usually preferred to tiles or shingles; but the bad effects that have proceeded from this mode when fires happen, has induced the inhabitants in all their new buildings to give the preference to slates and tiles. The lower parts of the houses, according to the custom of the Dutch nation, are not only uncommonly neat and clean in appearance, but they are really so; and the furniture is rather rich than elegant. But this is by no means the case with the bed-rooms or upper apartments; which are very barely and ill furnished. The streets are rough, uneven, and unpaved. But many of the houses have a space flagged before the door; and others have trees planted before them, which form a pleasant shade, and give an agreeable air to the streets.

The only landing-place is at the east end of the town, where there is a wooden quay running some paces into the sea, with several cranes on it for the convenience of loading and unloading the scoots that come along side. To this place excellent water is conveyed by pipes, which makes the watering of ships both easy and expeditious. Close to the quay, on the left hand, stands the castle and principal fortress; a strong extensive work, having excellent accommodations for the troops, and for many of the civil officers belonging to the company. Within the gates, the company have their principal stores; which are spacious as well as convenient. This fort covers and defends the east part of the town and harbour, as Amsterdam fort does the west part. The latter, which has been built since commodore Johnston's expedition, and whereon both French and Dutch judgment have been united to render it effectual and strong, is admirably planned and calculated to annoy and harass ships coming into the bay. Some smaller detached fortifications extend along the coast, both to the east and west, and make landing, which was not the

Good.

the case before the late war, hazardous and difficult. In a word, Cape Town is at this time fortified with strength, regularity, and judgment.

The governor's house is delightfully situated, nearly in the centre of an extensive garden, the property of the Dutch East India company, usefully planted, and at the same time elegantly laid out. The governor's family make what use they please of the produce of the garden, which is various and abundant; but the original intention of the company in appropriating so extensive a piece of ground to this purpose was, that their hospital, which is generally pretty full when their ships arrive after long voyages, may be well supplied with fruits and vegetables, and likewise that their ships may receive a similar supply. This garden is as public as St James's park; and for its handsome, pleasant, and well-shaded walks, is much frequented by persons of every description, but particularly by the fashionable and gay. At the upper end of the principal walk is a small space walled in for the purpose of confining some large ostriches and a few deer; and a little to the right of this is a small menagery, in which the company have half a dozen wild animals and about the same number of curious birds.

There are two churches in the town; one large, plain, and unadorned, for the Calvinists, the prevailing sect; and a smaller one for the Lutherans. The hospital, which is large and extensive, is situated at the upper end of the town, close to the company's garden; where the convalescents reap the benefit of a wholesome pure air, perfumed with the exhalations of a great variety of rich fruit trees, aromatic shrubs, and odorous plants and flowers; and likewise have the use of every production of it.

Besides their hospital, the Dutch East India company have several other public buildings, which tend to improve the appearance of the town. The two principal of these are, the stables and a house for their slaves. The former is a handsome range of buildings, capable of containing an incredible number of horses. Those they have at the Cape are small, spirited, and full of life. The latter is a building of considerable extent, where the slaves, both male and female, have separate apartments, in a very comfortable style, to reside in after the fatigues and toil of the day; and there are several officers placed over them, who have commodious apartments, and treat them humanely.

The inhabitants of the Cape, though in their persons large, stout, and athletic, have not all that phlegm about them which is the characteristic of Dutchmen in general. The physical influence of climate may in some degree account for this; for it is well known that in all southern latitudes the temper and disposition of the people are more gay, and that they are more inclined to luxury and amusements of every kind, than the inhabitants of the northern hemisphere. The ladies are lively, good-natured, and familiar; and from a peculiar gay turn, they admit of liberties that would be thought reprehensible in England, though perhaps they as seldom overleap the bounds of virtue as the women of other countries.

The heavy draft work about the Cape is mostly performed by oxen; which are here brought to an uncommon degree of usefulness and docility. It is not uncommon to see 14, 16, and sometimes 18, in one of

their teams; when the roads are heavy, they sometimes, though rarely, yoke 20; all which the Hottentots, Malays, and Cape slaves, have in the most perfect subjection and obedience. One of these fellows places himself on the fore part of the waggon, or, when loaded, on the top of the load, and with a tremendous long whip, which from its size he is obliged to hold in both his hands, manages these creatures with inexpressible address. When he finds expedition needful, he can make them keep whatever pace he chooses, either trot or gallop (a gait performed or kept up with difficulty by European oxen), and that with as much ease as if he was driving horses. They likewise manage horses with the same dexterity; and to see one of them driving three, four, five, and sometimes six pair, in hand, with one of these long whips, would make the most complete master of the whip in England cut a despicable figure. Carriages are not very numerous at the Cape, as the inhabitants in general travel in covered waggons, which better suit the roughness of the country. The governor and some few of the principal people keep coaches, which are a good deal in the English style, and always drawn by six horses.

Good Manners. See MANNERS.

GOOGINGS, in sea-language, are clamps of iron bolted on the stern-post of a ship, whereon to hang the rudder and keep it steady; for which purpose there is a hole in each of them, to receive a correspondent spindle bolted on the back of the rudder, which turns thereby as upon hinges.

GOOSE, in ornithology. See ANAS. The goose was held in great esteem amongst the Romans, for having saved the Capitol from the invasion of the Gauls by cackling and clapping its wings. Geese were kept in the temple of Juno; and the censors, when they entered upon their office, provided meat for them. There was also an annual feast at Rome, at which they carried a silver image of a goose in state; and hanged a dog, to punish that animal because he did not bark at the arrival of the Gauls.

GOOSE-Ander, in ornithology. See MERGUS.

GOOSE-Berry, in botany. See RIBES.

GOOSE-Neck, in a ship, a piece of iron fixed on the one end of the tiller, to which the laniard of the whip-staff or the wheel-rope comes, for steering the ship.

GOOSE-Wing, in the sea-language. When a ship sails before, or with a quarter-wind on a fresh gale, to make the more haste, they lanch out a boom and sail on the lee-side; and a sail so fitted, is called a *goose-wing*.

GORCUM, a town of the United Provinces, in South Holland, which carries on a considerable trade in cheese and butter. It is situated on the rivers Ligne and Maese, in E. Long. 4. 55. N. Lat. 51. 49.

GORDIANUS I. (a Roman general), was for his valour and virtues chosen emperor by the army in the reign of Maximinus, A. D. 237; but his son, whom he had associated with himself in the throne, being slain by Capellian, the governor of Mauritania for Maximinus, Gordianus killed himself the same year. See ROME.

GORDIANUS III. (grandson of the former), a renowned warrior, and styled *The guardian of the Roman*
commar

Good
Gordianus.

Gordian, commonwealth. He was treacherously assassinated by Philippus, an Arabian, one of his generals; who, to the eternal disgrace of the Romans of that era, succeeded him in the empire, A. D. 244. See ROME.

GORDIAN-KNOT, in antiquity, a knot made in the leathers or harness of the chariot of Gordius king of Phrygia, so very intricate, that there was no finding where it began or ended. The inhabitants had a tradition, that the oracle had declared, that he who untied this knot should be master of Asia. Alexander having undertaken it, was unable to accomplish it; when fearing lest his not untying it should be deemed an ill augury, and prove a check in the way of his conquests, he cut it asunder with his sword, and thus either accomplished or eluded the oracle.

GORDIUS, the *HAIR-WORM*, a genus of insects belonging to the class of *vermes intestina*. There are several species, 1. The aquaticus, or water hair-worm, is 10 or 12 inches in length, and of about the thickness of a horse hair: its skin is smooth and somewhat glossy, without furrows; its colour pale yellowish white all over, except the head and tail, which are black and glossy. The body is rounded, and very slender in proportion to its length: the mouth is small, and placed horizontally; the jaws are both of the same length, and obtuse at their extremities. This species is common in our fresh waters, more especially in clay, through which it passes as a fish does through the water, and is the author of many springs. This is the worm that in Guinea and in some other of the hot countries gets into the flesh of the natives, and occasions great mischief; with us, though frequent enough in water where people bathe, it never attempts this.—2. The argillaceus, or clay hair-worm, is only a variation of the preceding one in colour, being yellowish at the extremities. It chiefly inhabits the clay; and Linnæus calls that its proper element, from its being generally dug out of it.—3. The medinensis, or muscular hair-worm, is all over of a pale yellowish colour. It is a native of both Indies; frequent in the morning dew, from whence it enters the naked feet of the slaves, and occasions a disease much known in those countries, and to which children are very liable: it creates the most troublesome itchings, and too often excites a fever and inflammation. It particularly infects the muscles of the arms and legs, from whence it may be drawn out by means of a piece of silk or thread tied round the head: but the greatest caution is necessary in this simple operation, lest the animal, by being strained too much, should break; for if any part remains under the skin, it quickly grows with redoubled vigour, and becomes a cruel, and sometimes fatal enemy, to the poor slaves in particular. Baths with infusions of bitter plants, and all vermifuges, destroy it.—4. The marinus, or sea hair-worm, is filiform, twisted spirally, and lying flat, about half an inch in length; of a whitish colour, smooth, and scarcely diminishing at the head. It is as great a tormentor of herrings, bleaks, and various other fish, as the *gordius medinensis* is of man. The fish when infested with these animals rise to the surface, and tumble about as if in great agony.

GORDIUS, king of Phrygia, and father of Midas, was a poor husbandman, with two yokes of oxen, wherewith he ploughed his land and drew his wain. An eagle sitting a long while upon one of his oxen,

he consulted the soothsayers; a virgin bid him sacrifice to Jupiter in the capacity of king. He married the virgin, who brought forth Midas. The Persians instructed by the oracle to set the first person they met in a wain upon the throne, met Gordius, and made him king. Midas for this good fortune dedicated to Jupiter his father's cart. The knot of the yoke, they say, was so well twisted, that he who could unloose it was promised the empire of Asia; hence the proverb of *the Gordian knot* had its original. See *GORDIAN KNOT*.

GORDON (Alexander), an excellent draughtsman and a good Grecian, who resided many years in Italy, visited most parts of that country, and had also travelled into France, Germany, &c. was secretary to the Society for Encouragement of Learning; and afterwards to the Egyptian Club, composed of gentlemen who had visited Egypt (*viz.* lord Sandwich, Dr Shaw, Dr Pococke, &c.) He succeeded Dr Stukely as secretary to the Antiquarian Society, which office he resigned in 1741 to Mr Joseph Ames. He went to Carolina with governor Glen, where, besides a grant of land, he had several offices, such as register of the province, &c.; and died a justice of the peace, leaving a handsome estate to his family. He published, 1. *Itinerarium Septentrionale*, or a Journey through most parts of the Counties of Scotland, in two parts, with 66 copperplates, 1726, folio. 2. Supplement to the *Itinerarium*, 1732, folio. 3. The Lives of Pope Alexander VI. and his son Cæsar Borgia. 4. A complete History of the ancient Amphitheatres, 1730, 8vo. afterwards enlarged in a second edition. 5. An Essay towards explaining the hieroglyphical figures on the Coffin of the ancient Mummy belonging to Capt. William Lethieuller, 1737, folio, with cuts. 6. Twenty-five Plates of all the Egyptian Mummies and other Egyptian Antiquities in England, 1739, folio.

GORDON (Thomas), noted for his translations and political writings, was born at Kirkcudbright in North Britain. He came young to London; where he supported himself by teaching languages, until he procured employment under the earl of Oxford in queen Anne's time, but in what capacity is not now known. He first distinguished himself in the defence of Dr Hoadley in the Bangorian controversy; which recommended him to Mr Trenchard, in conjunction with whom he wrote the well-known Cato's Letters, upon a variety of important public subjects. These were followed by another periodical paper, under the title of the Independent Whig; which was continued some years after Mr Trenchard's death, by Gordon alone, against the hierarchy of the church; but with more acrimony than was shown in Cato's Letters. At length Sir Robert Walpole retained him to defend his administration, to which end he wrote several pamphlets. At the time of his death, July 28th 1750, he was first commissioner of the wine licences, an office which he had enjoyed many years. He was twice married. His second wife was the widow of his great friend Trenchard, by whom he had children.—He published English translations of Sallust and Tacitus, with additional discourses to each author, which contain much good matter. Also, two collections of his tracts have been preserved: the first intitled, A Cordial for Low-spirits, in three volumes; and the second, The Pillars of Priestcraft and Orthodoxy shaken, in two vo-

Gorged.

lumes. But these, like many other posthumous things, had better have been suppressed. In his translations as well as his other works he places the verbs at the ends of sentences, according to the Latin idiom, in a very stiff and affected manner.

GORDONIA, in botany: A genus of the polyandria order, belonging to the monadelphia class of plants. The calyx is simple; the style five-cornered, with the stigma quinquefid; the capsule quinquelocular; the seeds two-fold with a leafy wing. This is a tall and very straight tree, with a regular pyramidal head. Its leaves are shaped like those of the common bay, but serrated. It begins to blossom in May, and continues bringing forth its flowers the greatest part of the summer. The flowers are fixed to foot-stalks, four or five inches long; are monopetalous, divided into five segments, encompassing a tuft of stamina headed with yellow apices; which flowers, in November, are succeeded by a conic capsula having a divided calyx. The capsula, when ripe, opens, and divides into five sections, disclosing many small half-winged seeds. This tree retains its leaves all the year, and grows only in wet places, and usually in water. The wood is somewhat soft; yet Mr Catesby mentions his having seen some beautiful tables made of it. It grows in Carolina, but not in any of the more northern colonies.

GORE, in heraldry, one of the abatements, which, according to Gullim, denotes a coward. It is a figure consisting of two arch lines drawn one from the sinister chief, and the other from the sinister base, both meeting in an acute angle in the middle of the fess point. See **HERALDRY**.

GOREE, a small island of Africa, near Cape de Verd, subject to the French. It is a small spot not exceeding two miles in circumference, but its importance arises from its situation for trade so near Cape Verd, and it has been therefore a bone of contention between European nations. It was first possessed by the Dutch, from whom, in 1663, it was taken by the English; but in 1665 it was retaken by the Dutch, and in 1677 subdued by the French, in whose possession it remained till the year 1759, when the British arms were every where triumphant; and it was reduced by commodore Keppel, but restored to the French at the treaty of peace in 1763. It was retaken by the English in the last war, but again restored at the peace of 1783. E. Long. 17. 20. N. Lat. 14. 43.

GOREE, the capital town of an island of the same name in Holland, eight miles South of Briel. E. Long. 3. 50. N. Lat. 51. 55.

GOREY, a borough, fair, and post town in the county of Wexford, province of Leinster, otherwise called *Newborough*. It stands about 18 miles north of Wexford town, and 45 from Dublin. N. Lat. 52. 40. W. Long. 6. 30. It sends two members to parliament; patronage in the family of Ram.

GORGE, in architecture, the narrowest part of the Tuscan and Doric capitals, lying between the astragal, above the shaft of the pillar, and the annulets.

GORGE, in fortification, the entrance of the platform of any work. See **FORTIFICATION**.

GORGED, in heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a swan, &c. and in that case it is said, the lion or cygnet is gorged with a ducal coronet, &c.

GORGED is also used when the gorge or neck of a peacock, swan, or the like bird, is of a different colour or metal from the rest.

GORGET, a kind of breast-plate like a half moon, with the arms of the prince thereon; worn by the officers of foot. They are to be either gilt or silver, according to the colour of the buttons on the uniforms.

GORGET, or **GORGERET**, in surgery, is the name which the French give to the concave or cannulated conductor, used in lithotomy. See **SURGERY**.

GORGONA, a small island of Italy, in the sea of Tuscany, and near that of Corsica, about eight miles in circumference; remarkable for the large quantity of anchovies taken near it. E. Long. 10. 0. N. Lat. 43. 22.

GORGONA, a small island of the South Sea, 12 miles west of the coast of Peru, in America. It is indifferent high land, very woody, and some of the trees are very tall and large, and proper for masts. It is about 10 miles in circumference, and has several springs and rivulets of excellent water, but is subject to constant rains. W. Long. 79. 3. S. Lat. 3. 30.

GORGONIA, in natural history, a genus of zoophytes, which formerly were called *ceratophytions*, and are known in English by the names of *sea-fans*, *sea-feathers*, and *sea-whips*. Linnæus and Dr Pallas consider them as of a mixed nature in their growth, between animals and vegetables; but Mr Ellis shows them to be true animals of the polype kind, growing up in a branched form resembling a shrub, and in no part vegetable. They differ from the fresh water polype in many of their qualities, and particularly in producing from their own substance a hard and solid support, serving many of the purposes of the bone in other animals. This is formed by a concreting juice thrown out from a peculiar set of longitudinal parallel tubes, running along the internal surface of the fleshy part: in the coats of these tubes are a number of small orifices, through which the osseous liquor exudes, and concreting, forms the layers of that hard part of the annular circles, which some, judging from the consistence rather than the texture, have erroneously denominated *wood*. The surface of the gorgonia is composed of a kind of scales, so well adapted to each other as to serve for defence from external injuries: and the flesh, or, as some have called it, the *bark* or *cortex*, consists of proper muscles and tendons for extending the openings of their cells; for sending forth from thence their polype suckers in search of food; and for drawing them in suddenly, and contracting the sphincter muscles of these starry cells, in order to secure these tender parts from danger; and also of proper secretory ducts, to furnish and deposit the osseous matter that forms the stem and branches as well as the base of the bone. Mr Ellis affirms, that there are ovaries in these animals, and thinks it very probable that many of them are viviparous. See **CORALLINES**.

GORGONS, in antiquity and mythology. Authors are not agreed in the account they give of the Gorgons. The poets represent them as three sisters, whose names were *Sibeno*, *Euryale*, and *Medusa*; the latter of whom was mortal, and, having been deflowered by Neptune, was killed by Perseus; the two former were subject neither to age nor death. They are described with wings on their shoulders, with serpents round

Gorged

||
Gorgons.

Goritia
||
Goshen.

round their heads, their hands were of brass, and their teeth of a prodigious size, so that they were objects of terror to mankind. After the death of Medusa, her sisters, according to Virgil, were appointed to keep the gate of the palace of Pluto.

Multaque præterea variarum monstra ferarum—
GORGONES, *Harpyiaque*—

Diodorus Siculus will have the Gorgons and Amazons to have been two warlike nations of women, who inhabited that part of Libya which lay on the lake Tritonidis. The extermination of these female nations was not effected till Hercules undertook and performed it.

Pausanias says, the Gorgons were the daughters of Phorbus; after whose death Medusa, his daughter, reigned over the people dwelling near the lake Tritonidis. The queen was passionately fond of hunting and war, so that she laid the neighbouring countries quite waste. At last, Perseus having made war on them, and killed the queen herself, when he came to take a view of the field of battle, he found the queen's corpse so extremely beautiful, that he ordered her head to be cut off, which he carried with him to show his countrymen the Greeks, who could not behold it without being struck with astonishment.

Others represent them as a kind of monstrous women, covered with hair, who lived in woods and forests. Others, again, make them animals, resembling wild sheep, whose eyes had a poisonous and fatal influence.

GORITIA, or GORITZ, a strong town of Germany, in the circle of Austria, and duchy of Carniola, with a castle; seated on the river Lizonzo, 20 miles north-east of Aquileia, and 70 north-east of Venice. E. Long. 13. 43. N. Lat. 46. 12.

GORLÆUS (ABRAHAM), an eminent antiquary, was born at Antwerp, and gained a reputation by collecting medals and other antiques. He was chiefly fond of the rings and seals of the ancients, of which he published a prodigious number in 1601, under this title, *Dactyliotheca; sive Annulorum Sigillarium, quorum apud præcos tam Græcos quam Romanos usus ex ferro, ære, argento, et auro, Promptuarium*. This was the first part of the work: the second was intitled, *Variarum Gemmarum, quibus antiquitas in signando uti solita sculptura*. This work has undergone several editions, the best of which is that of Leyden, 1695: for it not only contains a vast number of cuts, but also a short explanation of them by Gronovius. In 1608, he published a collection of medals: which, however, if we may believe the *Scaligerana*, it is not safe always to trust. Gorlæus pitched upon Delft for the place of his residence, and died there in 1609. His collections of antiques were sold by his heirs to the prince of Wales.

GORLITZ, a town of Germany, in Upper Lusatia, subject to the elector of Saxony. It is a handsome strong place, and seated on the river Neisse, in E. Long. 15. 15. N. Lat. 51. 10.

GORTERIA, in botany: A genus of the polygamia frustanea order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked; the pappus woolly; the florets of the radius ligulated or plane; the calyx imbricated with spinous scales.

GOSHAWK. See FALCO.

GOSHEN (anc. geog.), a canton of Egypt, which

Joseph procured for his father and his brethren when they came to dwell in Egypt. It was the most fruitful part of the country: and its name seems to be derived from the Hebrew, *Geshem*, which signifies "rain;" because this province lying very near the Mediterranean, was exposed to rains, which were very rare in other cantons, and more especially in Upper Egypt. Calmet does not question but that Goshen, which Joshua (x. 41. xi. 16. xv. 51.) makes part of the tribe of Judah, is the same as the land of Goshen, which was given to Jacob and his sons by Pharaoh king of Egypt; (Gen. xli. 28). It is certain that this country lay between Palestine and the city of Tanais, and that the allotment of the Hebrews reached southward as far as the Nile, (Josh. xiii. 3.)

GOSLAR, a large and ancient town of Lower Saxony, and in the territory of Brunswick; it is a free imperial city, and it was here that gunpowder was first invented, by a monk as is generally supposed. It is a large place, but the buildings are in the ancient taste. In 1728, 280 houses, and St Stephen's fine church, were reduced to ashes. It is seated on a mountain, near the river Gose, and near it are rich mines of iron. The inhabitants are famous for brewing excellent beer. E. Long. 3. 37. N. Lat. 51. 55.

GOSPEL, the history of the life, actions, death, resurrection, ascension, and doctrine of Jesus Christ.—The word is Saxon, and of the same import with the Latin term *evangelium*, which signifies glad tidings, or good news.

This history is contained in the writings of St Matthew, St Mark, St Luke, and St John; who from thence are called *evangelists*. The Christian church never acknowledged any more than these four gospels as canonical; notwithstanding which, several apocryphal gospels are handed down to us, and others are entirely lost.

GOSPORT, a town of Hampshire, 79 miles from London, in the parish of Alverstock. It has a ferry over the mouth of the harbour to Portsmouth, and is a large town and of great trade, especially in time of war. Travellers choose to lodge here, where every thing is cheaper and more commodious for them than at Portsmouth. The mouth of the harbour, which is not so broad here as the Thames at Westminster, is secured on this side by four forts, and a platform of above 20 cannon level with the water. Here is a noble hospital built for the cure of the sick and wounded sailors in the service of the navy; besides a free school.

GOSSAMER is the name of a fine filmy substance, like cobwebs, which is seen to float in the air, in clear days in autumn, and is more observable in stubble-fields, and upon furze and other low bushes. This is probably formed by the flying spider, which, in traversing the air for food, shoots out these threads from its anus, which are borne down by the dew, &c.

GOSSYPIMUM, or COTTON: A genus of the polyandria order, belonging to the monodelphia class of plants; and in the natural method ranking under the 37th order, *Columnifera*. The calyx is double, the exterior one trifid; the capsule quadrilocular; the seeds wrapt in cotton-wool. There are four species, all of them natives of warm climates. 1. The herbaceous, or common herbaceous cotton, hath an herbaceous smooth stalk two feet high, branching upwards; ;

Goslar
||
Gossypium.

Gossypium five-lobed smooth leaves; and yellow flowers from the ends of the branches, succeeded by roundish capsules full of seed and cotton. 2. The *hirsutum*, or hairy American cotton, hath hairy stalks branching laterally two or three feet high: palmated, three and five lobed hairy leaves; and yellow flowers, succeeded by large oval pods furnished with seeds and cotton. 3. The *barbadense*, or Barbadoes shrubby cotton, hath a shrubby stalk branching four or five feet high, three-lobed smooth leaves, glandulous underneath; and yellow flowers succeeded by oval pods, containing seeds and cotton. 4. The *arboreum*, or tree cotton, hath an upright woody perennial stalk, branching six or eight feet high; palmated, four or five lobed smooth leaves; and yellow flowers, succeeded by large pods filled with seeds and cotton.

The first three species are annual, but the fourth is perennial both in root and stalk. In warm countries these plants are cultivated in great quantities in the fields for the sake of the cotton they produce; but the first species is most generally cultivated. The pods are sometimes as large as middling-sized apples, closely filled with the cotton surrounding the seed. When these plants are raised in this country, they must be continually kept in a warm stove, where they will produce seeds and cotton. They are propagated by seeds. See COTTON.

The American Islands produce cotton shrubs of various sizes, which rise and grow up without any culture; especially in low and marshy grounds. Their produce is of a pale red; some paler than others; but so short that it cannot be spun. None of this is brought to Europe, though it might be usefully employed in making of hats. The little that is picked up, serves to make mattresses and pillows.

The cotton-shrubs that supplies our manufactures, requires a dry and stony soil, and thrives best in grounds that have already been tilled. Not but that the plant appears more flourishing in fresh lands than in those which are exhausted; but while it produces more wood, it bears less fruit.

A western exposure is fittest for it. The culture of it begins in March and April, and continues during the first spring-rains. Holes are made at seven or eight feet distance from each other, and a few seeds thrown in. When they are grown to the height of five or six inches, all the stems are pulled up, except two or three of the strongest. These are cropped twice before the end of August. This precaution is the more necessary, as the wood bears no fruit till after the second pruning; and, if the shrub was suffered to grow more than four feet high, the crop would not be the greater, nor the fruit so easily gathered. The same method is pursued for three years; for so long the shrub may continue, if it cannot conveniently be renewed oftener with the prospect of an advantage that will compensate the trouble.

This useful plant will not thrive if great attention is not paid to pluck up the weeds that grow about it. Frequent rains will promote its growth; but they must not be incessant. Dry weather is particularly necessary in the months of March and April, which is the time of gathering the cotton, to prevent it from being discoloured and spotted.

When it is all gathered in, the seeds must be picked

out from the wool with which they are naturally mixed. This is done by means of a cotton-mill; which is an engine composed of two rods of hard wood, about 18 feet long, 18 lines in circumference, and fluted two lines deep. They are confined at both ends, so as to leave no more distance between them than is necessary for the seed to slip through. At one end is a kind of little millstone, which, being put in motion with the foot, turns the rods in contrary directions. They separate the cotton, and throw out the seed contained in it.

GOTHA, a town of Germany, in the circle of Upper Saxony, and capital of the duchy of Saxe-Gotha, in E. Long. 10. 36. N. Lat. 51. Some fancy this town had its name from the Goths, and that they fortified it in their march to Italy; but it was only a village till surrounded with walls by the bishop of Mentz in 964. It is situated in a fine plain on the river Leina, well built and strongly fortified. Here are two handsome churches and a very good hospital. Its chief trade is in dyers wood, of which they have three crops, but the third grows wild. The neighbouring country produces a vast deal of corn. The castle or ducal palace of Gotha was rebuilt in the 16th century by duke Ernest, surnamed *the Pious*, who caused both that and the town to be encompassed with ditches and ramparts; and gave it the name of *Friedensstien*, or the *Castle of Peace*, in opposition to its ancient name of *Grimmerstein*, or the *Castle of the Furies*. It is situated on a neighbouring eminence, from whence there is a vast prospect of a fruitful plain. In one of the apartments there is a collection of valuable rarities, and a noble library.

The dukedom of Saxe Gotha is about 30 miles long, and 12 broad. The reigning duke is Lewis Ernest, born in 1745, and married to the princess Maria Charlotte of Saxe-Meningen, by whom he has issue. He is the head of the Ernestine line of Saxony, descended from the elector John Frederick the Magnanimous, who was deprived of the electorate by the emperor Charles V. in 1574; since which the youngest branch called the *Albertine* has enjoyed it. He has several other principalities besides that of Saxe Gotha; and his revenues are computed at L. 200,000 a year, with which he maintains about 3000 regular troops. As he is the most powerful of all the Saxon princes of the Ernestine branch; so of all the courts of Saxony, next to that of Dresden, he has the most numerous and the most magnificent. His guards are well clothed, his liveries rich, and his tables served with more elegance than profusion. And yet by the prudent management of his public finances, his subjects are the least burdened with taxes of any state in Germany. The religion is Lutheran.

GOTHARD, one of the highest mountains of Switzerland; and from the top, where there is an hospital for monks, is one of the finest prospects in the world. It is eight miles from Aldorf.

GOTHEBORG, or GOTHENBURG, or *Gottenburg*. See GOTTENBURG.

GOTHIC, in general, whatever has any relation to the Goths: thus we say, Gothic customs, Gothic architecture, &c. See ARCHITECTURE.

GOTHLAND, the most southern province of Sweden, being a peninsula, encompassed on three sides by the Baltic Sea, or the channel at the entrance of it.

Gotha
||
Gothland.

Goths. It is divided into several parts, which are, East Gothland, West Gothland, Smaland, Halland, Bleking, and Schonen. It was a long time in the possession of the kings of Denmark, but was ceded to Sweden in 1654. The principal towns of Gothland are Calmar, Landskron, Christianople, Daleburg, Gothenburg, Helmsat, Lunden, Malmoe, and Vexio.

GOTHS, a warlike nation, and above all others famous in the Roman history, came originally out of Scandinavia (the name by which the ancients distinguished the present countries of Sweden, Norway, Lapland, and Finmark). According to the most probable accounts, they were the first inhabitants of those countries; and from thence sent colonies into the islands of the Baltic, the Cimbric Chersonesus, and the adjacent places yet destitute of inhabitants. The time of their first settling in Scandinavia, and the time when they first peopled with their colonies the abovementioned islands and Chersonesus, are equally uncertain; tho' the Gothic annals suppose the latter to have happened in the time of Serug the great grandfather of Abraham. This first migration of the Goths is said to have been conducted by their king Eric; in which all the ancient Gothic chronicles, as well as the Danish and Swedish ones, agree. Their second migration is supposed to have happened many ages after; when, the abovementioned countries being overstocked with people, Berig, at that time king of the Goths, went out with a fleet in quest of new settlements. He landed in the country of the Ulmerugians, now Pomerania, drove out the ancient inhabitants, and divided their lands among his followers. He fell next upon the Vandals, whose country bordered on that of the Ulmerugians, and overcame them; but instead of forcing them to abandon their country, he only made them share their possessions with the Goths.

The Goths who had settled in Pomerania and the adjacent parts of Germany being greatly increased, inasmuch that the country could no longer contain them, they undertook a third migration in great numbers, under Filimer surnamed the *Great*, their fifth prince after leaving Scandinavia; and taking their route eastward, entered Scythia, advanced to the Cimmerian Bosphorus, and, driving out the Cimmerians, settled in the neighbourhood of the Palus Mæotis. Thence in process of time, being greatly increased in Scythia, they resolved to seek new settlements; and, accordingly taking their route eastward, they traversed several countries, and at length returned into Germany.

Their leader in this expedition was the celebrated Woden, called also *Voden*, *Othen*, *Oden*, *Godan*, and *Guadan*. Of this Woden many wonderful things are related in the Sueo-gothic chronicles. He was king of the Asgardians, whom the northern writers will have to be the same with a people called *Aspurians* mentioned by Strabo and Ptolemy. By Strabo they are placed near the Cimmerian Bosphorus. Aspuria was the metropolis of a province which Strabo calls *Asia*; and Woden and his followers are styled by the ancient Gothic writers *Asa*, *Asiana*, and *Asiote*. The kings of Aspuria were masters of all that part of Scythia which lay to the westward of Imaus, and was by the Latins called *Scythia intra Imaum*, or "Scythia within Imaus."

At what time Woden reigned in this country, is quite uncertain; but all historians agree, that he went out in quest of new settlements with incredible numbers of people following him. He first entered Roxolania, comprehending the countries of Prussia, Livonia, and great part of Muscovy. From thence he went by sea into the north parts of Germany; and having reduced Saxony and Jutland, he at last settled in Sweden, where he reigned till his death, and became so famous that his name reached all countries, and he was by the northern nations worshipped as a god. He is supposed to have brought with him the Runic characters out of Asia, and to have taught the northern nations the art of poetry; whence he is styled the father of the Scaldi or Scaldri, their poets, who described in verse the exploits of the great men of their nation, as the bards did among the Gauls and Britons.

The Romans distinguished the Goths into two classes; the Ostrogoths and Visigoths. These names they received before they left Scandinavia, the *Visigoths* being softened by the Latins from *Westergoths*, or those who inhabited the western part of Scandinavia, as the Ostrogoths were those who inhabited the eastern part of that country. Their history affords nothing of moment till the time of their quarrelling with the Romans; which happened under the reign of the emperor Caracalla, son to Severus. After that time their history becomes so closely interwoven with that of the Romans, that for the most remarkable particulars of it we must refer to the article *ROME*. After the destruction of the Roman empire by the Heruli, the Ostrogoths, under their king Theodoric, became masters of the greatest part of Italy, having overcome and put to death Odoacer king of the Heruli in 494. They retained their dominion in this country till the year 553; when they were finally conquered by Narfes, the emperor Justinian's general: See (*History of*) *ITALY*. The Visigoths settled in Spain in the time of the emperor Honorius, where they founded a kingdom which continued till the country was subdued by the Saracens; see the article *SPAIN*.

The Goths were famous for their hospitality and kindness to strangers, even before they embraced the Christian religion. Nay, it is said, that from their being eminently good, they were called *Goths*, by the neighbouring nations; that name, according to Grotius and most other writers, being derived from the German word *guten*, which signifies "good." They encouraged, says Dio, the study of philosophy above all other barbarous or foreign nations, and often chose kings from among their philosophers. Polygamy was not only allowed but countenanced among them; every one being valued or respected according to the number of his wives. By so many wives they had an incredible number of children, of whom they kept but one at home, sending out the rest in quest of new settlements; and hence those swarms of people which overran so many countries. With them adultery was a capital crime, and irremissibly punished with death. This severity, and likewise polygamy, prevailed among them when they were known to the Romans only by the name of *Getae* (their most ancient name); as appears from the poet Menander, who was himself one of that nation; and from Horace, who greatly commends the chastity of their women. Their laws fell little short of those

Gothofred,
Gotten-
burg.

those of the ancient Romans. Their government was monarchical; their religion was much the same with that of the ancient Germans or Celtes; and their dress is described by Apollinaris Sidonius in the following words: "They are shod (says he) with high shoes made of hair, and reaching up to their ankles; their knees, thighs, and legs, are without any covering; their garments of various colours scarce reaching to the knee; their sleeves only cover the top of their arms; they wear green cassocks with a red border; their belts hang on their shoulder; their ears are covered with twisted locks; they use hooked lances and missile weapons."

GOTHOFRED, or GODFREY, (Denis or Dionysius), an eminent civil lawyer, born of an illustrious house at Paris, in 1549. Finding his country involved in the confusion of the leaguers, he accepted of a professor's chair at Geneva, until he was patronized and employed by Henry IV.; but being afterwards stripped of his employments as a huguenot, he at length retired to Heidelberg, from whence no offers were able to detach him. He was, however, disappointed of his intention to end his days there; for the disturbances that broke out in the Palatinate obliged him, in 1621, to take refuge in Strasburg, where he died the following year. He wrote a great number of books; but his principal work is the *Corpus Juris Civilis cum notis*.

GOTHOFRED (Theodore), son of the former, was born at Geneva in 1580. As soon as he had finished his studies, he went to Paris; where he conformed to the Romish religion, and applied with indefatigable industry to the study of history, that of France particularly, wherein he became very eminent, as appears by his works. In 1632, the king made him one of his historiographers, with a stipend of 3000 livres; and, in 1636, he was sent to Cologne, to assist at the treaty of peace negotiating there, on the part of France, by the cardinal of Lyons. This treaty being removed to Munster, Gothofred was sent thither, where he drew up Memoirs on the subject; and continued in that city, in the king's service, to his death in 1649. His principal work is his "Account of the Ceremonial of the kings of France."

GOTHOFRED (James), brother of the preceding, was born at Geneva in 1587. Applying himself to the study of the law, he obtained the professor's chair there, was made counsellor of the city, and was several times employed in France, Germany, Piedmont, and Switzerland, to negotiate their affairs in the name of the republic. He died in 1562; and his chief work is his *Codex Theodosianus, cum perpetuis commentariis, &c.*

GOTHOFRED (Denis), son of Theodore above mentioned, was born at Paris in 1615. He studied history after his father's example; became as eminent in that department of knowledge; and obtained the reversion of his father's place of historiographer royal, from Louis XIII. when he was but 25 years of age. He published his father's *Ceremonial of France*; finished his *Memoirs of Philip de Commines*; and was preparing a *History of Charles VIII.* when he died in 1681. It was published by his eldest son, Dennis, in 1684.

GOTTENBURG, a rich and strong town of West Gothland, in Sweden, with a good harbour, at the N° 141.

mouth of the river Gothelba; which is the best situated for foreign trade of any in Sweden, as it lies without the Sound. It occupies the site of an ancient town, named *Lodese*, which was built by Gustavus Vasa; and being endowed with considerable privileges, soon became the great emporium for the trade of the western provinces. Charles IX. when duke of Gothland, having in 1604 laid the foundations of a new town in the island of Hisingen at no great distance from Lodese, called it *Gatheborg* (since corrupted into *Gottenburg*), in honour of his duchy. Upon his accession to the throne, he erected in his new town a trading company; drew thither many foreigners, particularly the Dutch, to whom he allowed an exemption from all duties of export and import during 20 years; a corps of English and Scotch troops, under the command of William Stewart; and granted to the Calvinists established therein the free exercise of their religion, the first place in Sweden where this toleration was permitted. The town, being in 1611 reduced to ashes by the Danes, was rebuilt in the reign of Gustavus Adolphus in its present situation, and obtained a confirmation of its ancient rights, with the grant of several additional privileges.—It is built in a very singular situation. At a small distance from the sea is a marshy plain, scarcely more than half a mile in breadth, watered by the rivers Gotha and Moldal, and almost entirely inclosed with high ridges of rocks, so bare and rugged, that they scarcely produce a single blade of grass, and exhibit as barren an appearance as the summits of the loftiest Alps. Gottenburg stands partly upon the ridges, and partly in the plain; and is divided from these different situations into the Upper and Lower Town. The latter is entirely level, intersected by several canals in the manner of the Dutch towns; and its houses are all constructed upon piles: the upper part hangs on the declivities; and rows of buildings rise one above the other like the seats of an amphitheatre. The whole is regularly fortified; and its circumference is near three miles, exclusive of the suburbs, called *Haga*, which lie towards the harbour. The streets are all uniformly straight: a few of the houses are of brick; but the generality are constructed with wood painted red. The harbour is formed by two chains of rocks, and is about a quarter of a mile in breadth. Its entrance is defended by the fort of New Elfsborg, which stands upon a small rocky island, and contains a garrison of 250 men. There has been lately established at Gottenburg a Royal Society of Sciences and Literature, upon the plan of that of Upsala.—Mr Coxe was informed by a merchant who had resided 22 years at Gottenburg, that, during that period, its population had increased considerably, and that it now contained about 30,000 inhabitants. This flourishing state is attributed to the extension of its commerce, particularly its East India Company, and the success of the herring fishery. An English consul and several merchants of our nation reside at Gottenburg: and a chapel, with a regular chaplain, is appropriated to their use. E. Long. 11. 50. N. Lat. 57. 44.

GOTTINGEN, a considerable town of Lower Saxony in Germany, and in the duchy of Brunswick; formerly free and imperial, but now subject to the elector of Hanover. Here his late Majesty George II. founded an university. It is seated on the river Leine, in E. Long. 10. 5. N. Lat. 51. 32.

Gotten-
burg,
Gottingen.

Gottorp.
||
Goudt.

GOTTORP, a town of the duchy of Hefwic, in Denmark, and capital of the duchy of Holstein Gottorp, where the duke has a very fine palace.

GOUANIA, in botany: A genus of the monœcia order, belonging to the polygamia class of plants. The calyx of the hermaphrodite is quinquefid; there is no corolla; there are five antheræ covered with an elastic calyptra or hood; the style trifid; the fruit, inferior to the receptacle of the flower, divisible into three seeds. The male is like the hermaphrodite, but wanting stigma and germen.

GOUDA, or TURGOW, a considerable town of South Holland, in the United Provinces, remarkable for its stately church. It is seated on the river Iffel, in E. Long. 4. 37. N. Lat. 52. 2.

GOUDT (Henry), usually called *Count Goudt*, was born of a noble family at Utrecht, in 1570; and was a knight of the Palatinate. Being passionately fond of the arts, particularly painting and engraving, and desirous of engaging in them, he applied himself diligently to drawing, and made a great proficiency therein. He went to Rome, to examine the works of the great masters in that city. Here he contracted an intimacy with that excellent artist Adam Elsheimer; studied his manner of penciling, designing, and colouring; and made his works models for his own imitation. He pre-engaged all the pictures that his friend and favourite could finish, and even paid liberally for them before-hand; by which means he found himself in possession of a most desirable treasure. Those pictures which Goudt himself painted were neatly and delicately touched, in colour and pencil resembling Elsheimer, though they were in no degree equal to the paintings of that admirable master. On his return to his native country, a young woman who was in love with him, and desirous of fixing his affections upon her, gave him in his drink a love philtre: which, however, terminated in a very melancholy manner, by depriving him totally of his senses; and in the dreadful state of idiotism he dragged on a miserable life to the age of 69, his death happening in 1639. It is remarkable, that though lost to every other subject, when painting was spoken of he would discourse upon it in a very rational manner.

Goudt practised engraving as well as painting, and made seven beautiful prints after the pictures of Elsheimer, which are well known to the curious, and are to be met with in most choice collections. He worked with the graver only, in a very neat style; and produced a most powerful effect, not by strengthening the strokes, according to the usual method, but by crossing them with additional strokes, equally neat, and that five or six times, one over another, in the deep shadows. Considering the precision with which he executed his engravings, the freedom of handling the graver which may be discovered in them, is very astonishing. The weeds and other parts of the fore-ground in that admirable print of the Ceres, are very finely expressed. The heads of the figures are correctly drawn, and the other extremities are managed in a judicious manner. The seven prints done by him, from Elsheimer, mentioned above, are, 1. Ceres drinking from a pitcher. An old woman appears holding a candle at the door of the cottage, and a boy naked standing by her is laughing and pointing at the goddess; for which contempt he

VOL. VIII. Part I.

was metamorphosed by her into a frog. The powerful and striking effect of this engraving cannot be properly described. This print is distinguished also by the name of the *forcery*. 2. The flight into Egypt: A night-scene, in which the moon and stars are introduced with great success. 3. The angel with Tobit, who is drawing a fish by his side. The back-ground is a landscape; the weeds in the foreground, and the branches of the trees in front, as well as the foliage and weeds hanging from them, are beautifully expressed. 4. The angel with Tobit, crossing a stream of water: The back-ground, a landscape. 5. Baucis and Philemon entertaining Jupiter and Mercury. 6. A landscape, called the *Aurora*, representing the dawn of day. The effect is very beautiful. 7. The beheading of St John in prison, a very small upright oval print, which is by far the scarcest.

GOVERNMENT, in general, is the polity of a state, or an orderly power constituted for the public good.

Civil government was instituted for the preservation and advancement of mens civil interests, and for the better security of their lives, liberties, and properties. The use and necessity of government is such, that there never was an age or country without some sort of civil authority: but as men are seldom unanimous in the means of attaining their ends, so their differences in opinion in relation to government has produced a variety of forms of it. To enumerate them would be to recapitulate the history of the whole earth. But, according to Montesquieu, and most other writers, they may in general be reduced to one of these three kinds. 1. The republican. 2. The monarchical. 3. The despotic.—The first is that, where the people in a body, or only a part of the people, have the sovereign power; the second, where one alone governs, but by fixed and established laws; but in the despotic government, one person alone, without law and without rule, directs every thing by his own will and caprice. See the article LAW, n^o 1. 3—10.—On the subject of government at large, see Montesquieu's *L'Esprit des Loix*, l. 2. c. 1.; Locke, ii. 129, &c. quarto edition, 1768; Sidney on Government; Sir Thomas Smith *de Repub. Angl.* and Acherly's *Britannic Constitution*.—As to the Gothic government, its original and faults, &c. see Montesquieu's *L'Esprit des Loix*, l. 11. c. 8.—With respect to the feudal policy, how it limited government; see *FEOBAL System*.

GOVERNMENT is also a post or office, which gives a person the power or right to rule over a place, a city, or a province, either supremely or by deputation.

GOVERNMENT is likewise used for the city, country, or place to which the power of governing is extended.

GOUGE, an instrument used by divers artificers, being a sort of round hollow chissel; serving to cut holes, channels, grooves, &c. in wood, stone, &c.

GOULART (Simon), a famous minister of Geneva, was born at Senlis in 1543; and was one of the most indefatigable writers of his time. He made considerable additions to the Catalogue of witnesses of the truth, composed by Illyricus; and acquired a great reputation by his works; the principal of which are, 1. A translation of Seneca. 2. A collection of memorable histories. 3. A translation of St Cyprian *De lapsis*.

D

Govern-
ment
||
Goulart.

Gourd *lappis*. 4. Several devotional and moral treatises. He died at Geneva in 1628.

Gower. **GOURD**, in botany. See CUCURBITA.

GOURGUES (Dominique de), an illustrious French patriot, a private gentleman of Gascony. The Spaniards having inhumanly massacred a colony of Frenchmen who had settled in Florida, Gourgues took a severe revenge on them, an account of which is given under the article FLORIDA. On his return, he was received with acclamations by his countrymen, but was forbid to appear at court. Queen Elizabeth invited him to command an English fleet against the Spaniards in 1593; but he died at Tours in his way to England.

GOURNAY, a town of France, in the duchy of Normandy and territory of Bray, celebrated for its butter-market. It is situated on the river Ept, in E. Long. o. 33. N. Lat. 49. 25.

GOURNAY (Mary de Jars de), a lady celebrated for her learning, was the daughter of William de Jars, lord of Neufvi and Gournay. After the death of her father, she was protected by Montaigne and Cardinal Richelieu. To the daughter of the former she dedicated her *Noségay of Pindus*; and composed several other works, the most considerable of which is *Les Avis*. She died at Paris in 1685, aged 80. The critics are divided concerning the reputation of this lady: by some she is styled the *Siren of France*; others say her works should have been buried with her.

GOUT. See (*Index* subjoined to) MEDICINE.

GOWER (John), one of our most ancient English poets, was cotemporary with Chaucer, and his intimate friend. Of what family, or in what county he was born, is uncertain. He studied the law, and was some time a member of the society of Lincoln's-inn, where his acquaintance with Chaucer began. Some have asserted that he was a judge; but this is by no means certain. In the first year of Henry IV. he became blind; a misfortune which he laments in one of his Latin poems. He died in the year 1402; and was buried in St Mary Overie, which church he had rebuilt chiefly at his own expence, so that he must have lived in affluent circumstances. His tomb was magnificent, and curiously ornamented. It still remains, but hath been repaired in later times. From the collar of SS round the neck of his effigies, which lies upon the tomb, it is conjectured that he had been knighted. As to his character as a man, it is impossible, at this distance of time, to say any thing with certainty. With regard to his poetical talents, he was undoubtedly admired at the time when he wrote, though a modern reader may find it difficult to discover much harmony or genius in any of his compositions. He wrote, 1. *Sepeculum meditantis*, in French, in ten books. There are two copies of this in the Bodleian library. 2. *Vox clamantis*, in Latin verse, in seven books. Preserved also in the Bodleian library, and in that of All-Souls. It is a chronicle of the insurrection of the commons in the reign of Richard II. 3. *Confessio amantis*; printed at Westminster by Caxton in 1493. Lond. 1532, 1554. It is a sort of poetical system of morality, interspersed with a variety of moral tales. 4. *De rege Henrico IV.* Printed in Chaucer's works. There are likewise several historical tracts, in manuscript, written by our author, which are to be found

in different libraries; also some short poems printed in Chaucer's works.

GOWN, ROBE, a long upper garment, worn by lawyers, divines, and other graduates; who are hence called *men of the gown*, or *gownmen*.

The gown is an ample sort of garment, worn over the ordinary cloaths, hanging down to the feet.—It is fashioned differently for ecclesiastics and for laymen.

At Rome they gave the name “virile gown,” *toga virilis*, to a plain kind of gown which their youth assumed when arrived at puberty. This they particularly denominated *prætexta*. See TOGA, PRÆTEXTA, &c.

“The remarkable dress of our British ancestors (Mr Whitaker observes), which continued very nearly the same to the commencement of the last century among the natives of Ireland, and has actually descended to the present among the mountaineers of Scotland, and is therefore rendered very familiar to our ideas, carried in it an astonishing appearance to the Romans. And it seems to have been equally the dress of the men and women among the nobles of Britain. But in a few years after the erection of the Roman-British towns in the north, and in the progress of refinement among them, this ancient habit began to be disesteemed by the chiefs of the cities, and looked upon as the badge of ancient barbarism. And the growing prejudices were soon so greatly improved, that within 20 years only after the construction of the towns, the British sagum was actually resigned, and the Roman *toga* or gown assumed by many of them.” *History of Manchester*, 302.

“The gown, however, never became universal in Britain: and it seems to have been adopted only by the barons of the cities and the officers of the crown; and has therefore been transmitted to us as the robe of reverence, the ensign of literature, and the mantle of magistracy. The woollen and plaided garments of the chiefs having naturally superseded the leathern vestures of their clients, the former were still wore by the generality of the Britons; and they were retained by the gentlemen of the country, and by the commonalty both in country and city. That this was the case, appears evident from the correspondent conduct of the Gauls and Britons; who kept their Virgata Sagula to the last, and communicated them to the Franks and Saxons. The plaided drapery of the Britons still appeared general in the streets of Manchester; and must have formed a striking contrast to the gown of the chief, the dark mantle of Italy: and it and the ornamented buttons on the shoulder are preserved among us even to the present moment, in the parti-coloured cloathing and the tasselled shoulder-knots of our footmen.”

In some universities physicians wear a scarlet gown. In the Sorbonne, the doctors are always in gowns and caps. Beadles, &c. wear gowns of two or more colours.

Among the French officers, &c. they distinguish those of the *short gown* or *robe*; which are such as have not been regularly examined. They have also barbers of the *short gown*, who are such as are obliged to practise in an inferior way to those of the long robe.

Gown is also taken in the general for civil magistrature, or the profession opposite to that of arms. In this sense it was that Cicero said *cedant arma togæ*.

GOWRAN,

Gorwan
||
Graaf.

GOWRAN, a borough, fair, and post town, in the county of Kilkenny and province of Leinster, Ireland. N. Lat. 52. 34. W. Long. 7 0. It is governed by a portrieve, recorder, and town-clerk. Here are the ruins of an old church, alfoth e handsome feat of the late lord Clifden; and three miles beyond Gowran the ruins of Ballinabola castle.

GOYEN (John Van), painter of landfapes, cattle, and fea-pieces, was born at Leyden in 1596; and was for fome time inſtructed by Ifaac Nicholai, who was reputed a good painter; but afterwards he became the difciple of Efaías Vandervelde, the moſt celebrated landſcape painter of his time. Van Goyen very ſoon roſe into general eſteem; and his works are more univerſally ſpread through all Europe than the works of any other maſter, for he poſſeſſed an uncommon readineſs of hand and freedom of pencil. It was his conſtant pleaſure and practice to ſketch the views of villages and towns ſituated on the banks of rivers or canals; of the ſea-ports in the Low Countries; and ſometimes of inland villages, where the ſcenes around them appeared to him pleaſing or pictureſque. Thoſe he afterwards uſed as ſubjects for his future landſcapes; enriching them with cattle, boats, and figures in character, juſt as the livelineſs of his imagination directed. He underſtood perſpective extremely well, and alſo the principles of the chiaro-ſcuro; which branches of knowledge enabled him to give his pictures a ſtrong and agreeable effect. He died in 1656, aged 60.—His uſual ſubjects were ſea-pieces, or landſcapes with views of rivers, enlivened with figures of peaſants either ferrying over cattle, drawing their nets in ſtill water, or going to or returning from market. Sometimes he repreſented huts of boors on the banks of rivers, with overhanging trees, and a beautiful reflexion of their branches from the transparent ſurface of the waters. Theſe were the ſubjects of his beſt time, which he generally marked with his name and the year; and the high finiſhed pictures of Van Goyen will be for ever eſtimable. But as he painted abundance of pictures, ſome are ſlight, ſome too yellow, and ſome negligently finiſhed; though all of them have merit, being marked with a free, expeditious, and eaſy pencil, and a light touch. His pictures frequently have a greyiſh caſt; which did not ariſe from any miſmanagement of the tints, or any want of ſkill in laying on the colours; but was occaſioned by his uſing a colour called *Haerlem blue*, much approved of at that time, though now entirely diſuſed, becauſe the artiſts found it apt to fade into that greyiſh tint; and it hath alſo rendered the pictures of this maſter exceedingly difficult to be cleaned without injuring the finer touches of the finiſhing. His beſt works are valued ſo highly in moſt parts of Europe, and eſpecially in the Low Countries, that they deſervedly afford large prices, being ranked in Holland with the pictures of Teniers; and at this time are not eaſily procured, particularly if they are undamaged, though his ſlighter performances are ſufficiently common.

GRAAF (Regnier de), a celebrated phyſician, born at Schoonhaven, in Holland, in 1641. He ſtudied phyſic at Pruffia. He was educated in Leyden, where he acquired great honour by publiſhing a treatiſe *De Succo Pancreatico*. He alſo publiſhed three pieces upon the organs of generation, both male and female; upon which ſubject he had a controverſy with

Swammerdam. He died young, in 1673; and his works, with his life prefixed, were publiſhed at Leyden in 1677, in 8vo.

GRABE (John Erneſt), a very learned writer in the beginning of the 18th century, a native of Koniagsberg in Pruffia. He was educated in the Lutheran religion; but the reading of the fathers led him into doubts. He preſented to the electoral conſistory at Sambia in Pruffia a memorial containing his doubts. The elector gave orders to three eminent divines to answer them. Their answers ſhook him a little in his reſolution of embracing the Roman Catholic religion; and one of them, Spener, adviſed him to go to England. He went; and king William gave him a penſion, which was continued by queen Anne. He was ordained a prieſt of the church of England, and honoured with the degree of doctor of divinity by the univerſity of Oxford; upon which occaſion Dr George Smalridge pronounced two Latin orations, which were afterwards printed. He wrote, 1. *Spicilegium S. S. Patrum, ut et Hereticorum ſaculi poſt Chriſtum natum*, 8vo. 2. An edition of the Septuagint, from the Alexandrian manuſcript in St James's library. 3. Notes on Juſtin, &c.; and other works, which are eſteemed by the learned.

GRACCHUS (Tiberius), elected tribune of the Roman people, demanded in the ſenate, in their name, the execution of the Agrarian law; by which all perſons poſſeſſing above 200 acres of land were to be deprived of the ſurplus, for the benefit of the poor citizens, amongſt whom an equal diſtribution of them was to be made. Having carried his plan into execution by violent meaſures, he fell a victim to his zeal, being aſſaſſinated by his own party, 133 B. C. Caius his brother, purſuing the ſame ſteps, was killed by the conſul Opimius, 121 B. C. See (hiſtory of) ROME.

GRACE, among divines, is taken, 1. For the free love and favour of God, which is the ſpring and ſource of all the benefits we receive from him. 2. For the work of the Spirit renewing the ſoul after the image of God; and continually guiding and ſtrengthening the believer to obey his will, to reſiſt and mortify ſin, and overcome it.

GRACE is alſo uſed, in a peculiar ſenſe, for a ſhort prayer ſaid before and after meat.

The proofs of the moral obligation of this ceremony, drawn from different paſſages of the New Teſtament, are ſo well known, that it is needleſs to inſiſt on them here. Some others, drawn from the practice of different nations, and of very remote antiquity, may not be diſagreeable to our readers.

1. Athenæus tells us, in his *Deipnoſoph.* lib. ii. that in the famous regulation made by Amphiſtyon king of Athens with reſpect to the uſe of wine, both in ſacrifices and at home, he required that the name of *Jupiter the Suſtainer* ſhould be decently and reverently pronounced. The ſame writer, in lib. iv. p. 149. quotes Hermeias, an author extant in his time, who informs us of a people in Egypt, inhabitants of the city of Naucratis, whoſe cuſtom it was on certain occaſions, after they had placed themſelves in the uſual poſture of eating at the table, to riſe again and kneel; when the prieſt or precentor of the ſolemnity began to chant a grace, according to a ſtated form amongſt them; and when that was over, they joined in the meal in a ſolemn ſacrificial manner. Heliodorus has a paſſage in his *Æthiopics* to the ſame purpoſe, that it

Grabe
||
Grace.

Grace.

was the custom of the Egyptian philosophers to pour out libations and put up ejaculations before they sat down to meals. Porphyry, in his treatise *De abstinentia*, lib. iv. p. 408. gives a great character of the Samnean gymnosophists in Egypt for the strictness of their life: as one article in their favour, he observes, that at the founding of a bell before their meals, which consisted only of rice, bread, fruits, and herbs, they went to prayers; which being ended, and not before, the bell sounded again, and they sat down to eating. In general this was a religious usage or rite amongst the ancient Greeks; and derived from yet older ages, if Clement of Alexandria rightly informs us. He mentions, that these people, when they met together to refresh themselves with the juice of the grape, sung a piece of music, in imitation of the Hebrew psalms, which they called a *scholion*. Livy, lib. xxxix. speaks of it as a settled custom among the old Romans, that they offered sacrifice and prayer to the gods at their meals and computations. But one of the fullest testimonies to our purpose is given by Quintilian, *Declam.* 301. *Adisti mensam*, says he, *ad quam cum venire capimus, Deos invocamus*; "We approached the table (at supper together), and then invoked the gods."

The Jesuit Trigautius, in his very elegant and instructive narrative of the Christian expedition of their missionaries into China, book i. p. 69. gives this account of the people there in the particular now under consideration. "Before they place themselves for partaking of an entertainment, the person who makes it sets a vessel, either of gold, or silver, or marble, or some such valuable material, in a charger full of wine, which he holds with both his hands, and then makes a low bow to the person of chief quality or character at the table. Then, from the hall or dining-room, he goes into the porch or entry, where he again makes a very low bow, and turning his face to the south, pours out this wine upon the ground as a thankful oblation to the Lord of heaven. After this, repeating his reverential obeisance, he returns into the hall," &c.

The Turks pray for a blessing on their meat; and many more instances might be produced of infidels who have constantly observed the like custom in some way or other.

2. The fact, therefore, with respect to the heathen world, being thus evident, we proceed to the sentiments and behaviour of the Jews in this particular. Their celebrated historian Josephus, giving a detail of the rites and customs of the Essenes, who were confessedly the strictest and most pious professors of the Jewish religion, has this remarkable passage to the present purpose: "The priest," says he, "begs a blessing before they presume to take any nourishment; and it is looked upon as a great sin to take or taste before." Then follows the thanksgiving before meat: and "when the meal," proceeds he, "is over, the priest prays again; and the company with him bless and praise God as their preserver, and the donor of their life and nourishment."

Philo, in his book *De vita contemplativa*, gives an account of a body of men and women stricter than even the Essenes themselves. He distinguishes them by no particular name, though his relation is very accurate and circumstantial; namely, that on certain spe-

cial occasions, before "they took their meals, they placed themselves in a proper decent order; when, lifting up their hands and eyes to heaven, they prayed to God that he would be pleased to be propitious to them in the use of those his good creatures."

From the Hebrew ritual it appears, that the Jews had their hymns and psalms of thanksgiving, not only after eating their passover, but on a variety of other occasions, at and after meals, and even between their several courses and dishes; as when the best of their wine was brought upon the table, or their aromatic confections, or the fruit of the garden, &c. On the day of the passover was sung Psalm cxiv. "When Israel came out of Egypt," &c.

Aristæus has a passage full on the present subject. "Moses," says he, "commands, that when the Jews are going to eat or drink, the company should immediately join in sacrifice or prayer." Where Rabbi Eleazar (upon that author) met with this sentence, has been controverted. But supposing it not to be found in scriptis, it is sufficient for us to know that the Jews did constantly practise this custom, upon the foundation of an ancient and general tradition and usage. That the prophet Daniel gave thanks before meat, is evident from the Apocryphal book concerning Bel and the Dragon, where, ver. 38, 39. we find, that "Daniel said, Thou hast remembered me, O God! neither hast thou forsaken them who seek thee and love thee. So Daniel arose, and did eat." Of this text Prudentius takes notice in Cathemirin, hymn iv.

*His sumptis Danielis excitavit
In calum faciem, ciboque fortis,
Amen reddidit, allelujah dixit.*

The much-beloved took the repast,
And up to heav'n his eyes he cast;
By which refresh'd, he sung aloud,
Amen, and allelujah to his God.

Where, by the way, it may be observed, that the poet is a little mistaken in making the prophet give thanks after meat; whereas, according to the text, he did it before.

GRACE, or *Gracefulness*, in the human character; an agreeable attribute, inseparable from motion as opposed to rest, and as comprehending speech, looks, gesture, and loco-motion.

As some motions are homely, the opposite to graceful; it is to be inquired, With what motions is this attribute connected? No man appears graceful in a mask; and therefore, laying aside the expressions of the countenance, the other motions may be genteel, may be elegant, but of themselves never are graceful. A motion adjusted in the most perfect manner to answer its end, is elegant; but still somewhat more is required to complete our idea of grace or gracefulness.

What this unknown *more* may be, is the nice point. One thing is clear from what is said, that this *more* must arise from the expressions of the countenance: and from what expressions so naturally as from those which indicate mental qualities, such as sweetness, benevolence, elevation, dignity? This promises to be a fair analysis; because of all objects mental qualities affect us the most; and the impression made by graceful appearance upon every spectator of taste, is too deep for any cause purely corporeal.

The next step is, to examine what are the mental qualities,

Grace.

Gracula.

A. Bell Pin. Wal. Sculptor fecit.

Graces. qualities, that, in conjunction with elegance of motion, produce a graceful appearance. Sweetness, cheerfulness, affability, are not separately sufficient, nor even in conjunction. Dignity alone, with elegant motion, produce a graceful appearance; but still more graceful with the aid of other qualities, those especially that are the most exalted. See DIGNITY.

But this is not all. The most exalted virtues may be the lot of a person whose countenance has little expression: such a person cannot be graceful. Therefore to produce this appearance, we must add another circumstance, viz. an expressive countenance, displaying to every spectator of taste, with life and energy, every thing that passes in the mind.

Collecting these circumstances together, grace may be defined, "that agreeable appearance which arises from elegance of motion and from a countenance expressive of dignity." Expressions of other mental qualities are not essential to that appearance, but they heighten it greatly.

Of all external objects, a graceful person is the most agreeable.

Dancing affords great opportunity for displaying grace, and haranguing still more. See DANCING, DECLAMATION, and ORATORY.

But in vain will a person attempt to be graceful who is deficient in amiable qualities. A man, it is true, may form an idea of qualities he is destitute of; and, by means of that idea, may endeavour to express these qualities by looks and gestures: but such studied expression will be too faint and obscure to be graceful.

Act of GRACE, the appellation given to the act of parliament 1696, c. 32. which allows prisoners for civil debts to be set at liberty, upon making oath that they have not wherewithal to support themselves in prison, unless they are alimented by the creditors on whose diligences they were imprisoned, within ten days after intimation made for that purpose.

Days of GRACE, three days immediately following the term of payment of a bill, within which the creditor must protest it if payment is not obtained, in order to intitle him to recourse against the drawer.

GRACE is also a title of dignity given to dukes, archbishops, and in Germany to barons and other inferior princes.

GRACES, *GRATIAE*, *Charites*, in the heathen theology, were fabulous deities, three in number, who attended on Venus. Their names are, Aglia, Thalia, and Euphrosyne; i. e. shining, flourishing, and gay; or, according to some authors, Pafitheia, Euphrosyne, and Ægiale. They were supposed by some to be the daughters of Jupiter and Eurynome the daughter of Oceanus; and by others, to be the daughters of Bacchus and Venus.

Some will have the Graces to have been four; and make them the same with the *Hora* "hours", or rather with the four seasons of the year. A marble in the king of Prussia's cabinet represents the three Graces in the usual manner, with a fourth seated and covered with a large veil, with the words underneath, *Ad Sorores IIII*. But this groupe we may understand to be the three Graces, and Venus, who was their sister, as being daughter of Jupiter and Dione.

The Graces are always supposed to have hold of each other's hands, and never parted. They were

painted naked, to show that the Graces borrow nothing from art, and that they have no other beauties than what are natural.

Yet in the first ages they were not represented naked, as appears from Pausanias, lib. vi. and lib. ix. who describes their temple and statues. They were of wood, all but their head, feet, and hands, which were white marble. Their robe or gown was gilt; one of them held in her hand a rose, another a dye, and the third a sprig of myrtle.

GRACILIS, a muscle of the leg, thus called from its slender shape. See ANATOMY, *Table of the Muscles*.

GRACULA, the GRACKLE, in ornithology, a genus belonging to the order of picæ. The bill is convex, cultrated, and bare at the point; the tongue is not cloven, but is fleshy and sharpish; it has three toes before and one behind. 1. The religiosa, lesser grackle, or Indian stare, is about the size of a blackbird, the bill an inch and a half long, and of an orange colour. The general colour of the plumage is black, glossed with violet, purple, and green, in different reflections of light: on the quills is a bar of white: the feathers and legs are orange yellow, and the claws of a pale brown. This species, which is found in several parts of the East Indies, in the Isle of Hainan, and almost every isle beyond the Ganges, is remarkable for whistling, singing, and talking well, much better than any of the parrot genus, and in particular very distinct. Its food is of the vegetable kind. Those kept in this climate are observed to be very fond of cherries and grapes: if cherries are offered to one, and it does not immediately get them, it cries and whines like a young child, till it has obtained its desire. It is a very tame and familiar bird. 2. The barita, or boat-tailed grackle, is about the size of a cuckoo. The bill is sharp, black, and an inch and a half in length; the general colour of the plumage is black, with a gloss of purple, especially on the upper parts; the legs and claws are black, the latter hooked. There is a singularity in the folding up of the tail-feathers, which, instead of forming a plain surface at top, sink into a hollow like a deep gutter. It always carries its tail expanded when on the ground, folding it up in the above singular manner only when perched or flying. It inhabits Jamaica; and it feeds on maize, beetles, and other insects, as well as on the fruit of the banana. It is likewise common in North America, keeping company with the flocks of the maize-thieves, and red-winged oriole. These breed in the swamps, and migrate in September, after which none are seen. 3. The quiscula, purple-jackdaw, or Barbadoes blackbird, is about the size of a blackbird: the whole bird is black, but most beautifully and richly glossed with purple, especially on the head and neck. The female is wholly of a brown colour, deepest on the wings and tail. This species inhabits Carolina, Mexico, and other parts of North America, also Jamaica. These birds for the most part feed on maize, whence the name of *maize-thieves* has been given them; but this is not their only food, for they are known also to feed on many other things. In spring, soon after the maize seed is put into the ground, they scratch it up again; and as soon as the leaf comes out, they take it up with their bills, root and all; but when it is ripe they do still more damage,

Gracilis.

for

Graculus
III
Grævius.

for at that time they come in troops of thousands, and are so bold, that if disturbed in one part of a field they only go to another. In New Jersey and Pensylvania three pence *per* dozen was once given for the dead birds, and by means of this premium they were nearly extirpated in 1750; when the persecution of them was abated on account of the great increase of worms which had taken place in the meadows, and which in the preceding year had left so little hay in New England as to occasion an importation from other parts. The grakles were therefore again tolerated, as it was observed that they fed on these worms till the maize was ripe. These birds build in trees. They are said to pass the winter in swamps, which are quite overgrown with wood, from thence only appearing in mild weather; and after the maize is got in, are content to feed on other things, as the aquatic tare-grass, and if pressed by hunger, buck-wheat and oats, &c. they are said also to destroy that pernicious insect the bruchus pisi. Their note is pretty and agreeable; but their flesh is not good to eat. 4. The cristatella, or Chinese starling, is a little bigger than a blackbird. The bill is yellow or orange; and the general colour of the plumage blackish, with a tinge of blue: the legs are of a dull yellow. These birds, which are said to talk and whistle very well, are common in China, where they are very much esteemed, and the figures of them are seen frequently in Chinese paintings. Their food is rice, insects, worms, and such like. They are seldom brought to England alive, requiring the greatest care in the passage.—There are eight other species of Gracula.

GRACULUS, in ornithology. See CORVUS.

GRADATION, in general, the ascending step by step, or in a regular and uniform manner.

GRADATION, in logic, a form of reasoning, otherwise called *SORITES*.

GRADATION, in painting, a gradual and insensible change of colour, by the diminution of the tints and shades.

GRADATION, in rhetoric, the same with *CLIMAX*.

GRADISKA, a strong town of Hungary in Sclavonia, on the frontiers of Croatia, taken by the Turks in 1691. It is seated on the river Save, in E. Long. 17. 55. N. Lat. 45. 38.

GRADISKA, a strong town of Italy, in a small island of the same name on the frontiers of Friuli, in E. Long. 13. 17. N. Lat. 46. 6. It is subject to the house of Austria.

GRADO, a strong town of Italy, in a small island of the same name, on the coast of Friuli, and in the territory of Venice. E. Long. 13. 35. N. Lat. 45. 52.

GRADUATE, a person who has taken a degree in the university. See *DEGREE*.

GRÆVIUS (John George), one of the most learned writers in the 17th century. In the 24th year of his age, the elector of Brandenburg made him professor at Duisbourg. In 1658, he was invited to Deventer to succeed his former master Gronovius. In 1661, he was appointed professor of eloquence at Utrecht; and 12 years after he had the professorship of politics and history conferred on him. He fixed his thoughts here, and refused several advantageous offers. He had, however, the satisfaction to be sought

after by divers princes, and to see several of them come from Germany to study under him. He died in 1703, aged 71. His *Thesaurus antiquitatum et historiarum Italiae*, &c. and other works, are well known.

GRAFTING, or ENGRAFTING, in gardening, is the taking a shoot from one tree, and inserting it into another, in such a manner that both may unite closely and become one tree. By the ancient writers on husbandry and gardening, this operation is called *incision*, to distinguish it from inoculation or budding, which they call *inferere oculos*.

Grafting hath been practised from the most remote antiquity; but its origin and invention is differently related by naturalists. Theophrastus tells us, that a bird having swallowed a fruit whole, cast it forth into a cleft or cavity of a rotten tree; where mixing with some of the putrified parts of the wood, and being washed with the rains, it budded, and produced within this tree another tree of a different kind. This led the husbandman to certain reflections, from which soon afterwards arose the art of engrafting.

Pliny sets the same thing in a different light: a countryman having a mind to make a pallisade in his grounds, that it might endure the longer, he bethought himself to fill up and strengthen the bottom of the pallisade, by fanning or wattling it with the trunks of ivy. The effect of this was, that the stakes of the pallisades taking root, became engrafted into the trunks, and produced large trees; which suggested to the husbandman the art of engrafting.

The use of grafting is to propagate any curious sorts of fruits so as to be certain of the kinds; which cannot be done by any other method: for as all the good fruits have been accidentally obtained from seeds, so the seeds of these, when sown, will many of them degenerate, and produce such fruit as is not worth the cultivating: but when shoots are taken from such trees as produce good fruit, these will never alter from their kind, whatever be their stock or tree on which they are grafted.

The reason or philosophy of engrafting is somewhat obscure; and had not accident given the first hint, all our knowledge of nature would never have led us to it. The effect is ordinarily attributed to the diversity of the pores or ducts of the graft from those of the stock, which change the figure of the particles of the juices in passing through them to the rest of the tree.

Mr Bradley, on occasion of some observations of Agricola, suggests something new on this head. The stock grafted on, he thinks, is only to be considered as a fund of vegetable matter, which is to be filtered through the cyon, and digested, and brought to maturity, as the time of growth in the vessels of the cyon directs. A cyon, therefore, of one kind, grafted on a tree of another, may be rather said to take root in the tree it is grafted in, than to unite itself with it: for it is visible that the cyon preserves its natural purity and intent, though it be fed and nourished with a mere crab; which is, without doubt, occasioned by the difference of the vessels in the cyon from those of the stock: so that grafting may be justly compared to planting.

In prosecution of this view of that ingenious author, we add, that the natural juices of the earth, by their secretion

Grafting.

Grafting secretion and comminution in passing through the roots, &c. before they arrive at the cyon, must doubtless arrive there half elaborated and concocted; and so disposed for a more easy, plentiful, and perfect assimilation and nutrition; whence the cyon must necessarily grow and thrive better and faster than if it were put immediately in the ground, there to live on coarse diet and harder of digestion: and the fruit produced by this further preparation in the cyon, must be finer and further exalted than if fed immediately from the more imperfectly prepared and altered juices of the stock.

Many have talked of changing of species, or producing mixed fruits, by engrafting one tree on another of the same class; but as the graft carries the juices from the stock to the pulp of the fruit, there is little hope of succeeding in such an expectation by ever so many repeated grafts: but if, after changing the graft and stock several successive times, you set the seed of the fruit produced on the graft in a good mould, it is possible that a change may happen, and a new mixed plant may be produced. Thus the almond and peach may, by many changes in the graftings, and by interrations of the stones of the peaches, and of the shells of the almonds, and by teribrations of the stem of the root here and there, alter their nature so much, that the coat or pulp of the almond may approach to the nature of the peach, and the peach may have its kernel enlarged into a kind of almond; and on the same principle, the curious gardener may produce many such mixed kinds of things.

Mr Du Hamel has observed, that, in grafting of trees, there is always found at the insertion of the graft, a change in the directions of fibres, and a sort of twisting or turning about of the vessels, which greatly imitates that in the formation of certain glands in animal bodies: and from thence he infers, that a new sort of viscus being formed by this means, the fruit may very naturally be so far influenced by it, as to be meliorated on the new branch; but that no such sudden and essential changes can be effected by those means, as too many of the writers on agriculture pretend. He observes, however, that this anatomical observation would not have been sufficient to convince him of the falsity of too many of these relations, had not experiment joined to confirm him in this opinion. He tried many grafts on different trees; and, for fear of error, repeated every experiment of consequence several times: but all served only to convince him of the truth of what he at first suspected. He grafted in the common way the peach upon the almond, the plum upon the apricot, the pear upon the apple, the quince, and the white thorn; one species of plum on other very different species, and upon the peach the apricot and the almond. All these succeeded alike: the species of the fruit was never altered; and in those which would not come to fruit, the leaves, the wood, and the flowers, were all the same with those of the tree from whence the graft was taken.

Authors on agriculture have also mentioned a very different sort of grafting; namely, the setting grafts of one tree upon stocks of a different genus; such as the grafting the pear upon the oak, the elm, the maple, or the plum, &c. Mr Du Hamel tried a great number of those experiments carefully, and found

Grafting every one of them unsuccessful; and the natural conclusion from this was, that there must be some natural alliance between the stocks and their grafts, otherwise the latter will either never grow at all or very soon perish.

Notwithstanding the facility with which grafts generally take on good stocks, there are many accidents and uncertainties attending them in their different periods. Some perish immediately; some, after appearing healthy for many months, and some even for years. Of these last some die without the stock suffering any thing; others perish together with the stocks. It is very certain, that the greater part of grafted trees do not live so long as they would have done in their natural state; yet this is no unexceptionable rule: for there are some which evidently live the longer for this practice; nay, there are instances of grafts which, being placed on stocks naturally of short duration, live longer than when placed on those which are more robust and lasting. These irregularities have been but little considered hitherto, though they might be made productive of considerable advantages.—One great requisite for the succeeding of any graft is, that it be in its own nature capable of so close and intimate an union with the substance of the stock, that it becomes as it were a natural branch of it. If all trees resembled one another in their structure and juices, the size and elasticity of their vessels, &c. probably the grafts of all trees would succeed upon one another; but this is by no means the case.

Trees are well known to be composed of numerous arrangements of hollow fibres, and these are different and unequal in every species of tree. In order to the succeeding of a graft, it is plain that there must be a conformity in its vessels and juices with those of the stock; and the more nearly they agree in this, probably the better they succeed; and the farther they differ, the worse.—If there be, however, some difference in the solid parts of trees, there are evidently many more in the juices. The sap in some trees is white as milk, in others it is reddish, and in some as clear and limpid as water. In some, it is thin and very fluid; in others, thick and viscous. In the taste and smell of these juices there are also not less differences: some are sweet, some insipid, some bitter, some acrid, and some fetid: the quality of the sap thus makes a very great difference in the nature of trees; but its quantity, and derivation to the parts, is scarce less observable. Of this we have familiar instances in the willow and the box; one of which will produce longer shoots in one year than the other in twenty.

Another difference yet more striking, and indeed more essential in regard to the growth of grafts than all these, is the different season of the year at which trees shoot out their leaves, or ripen their flowers. The almond-tree is in flower before other trees in general have opened their earliest buds; and when other trees are in flower, this is full of leaves, and has its fruit set before the mulberry begins to push out its earliest buttons. When we consider all these differences in trees, we cannot but wonder how it is possible for a branch of one to live upon another; and it becomes a much more perplexing question how any graft can succeed, than how such numbers come to miscarry. A graft of one pear upon another shall be seen

Grafting.

seen to succeed presently as if upon its own tree ; and in a fortnight will gain six inches in length, and so of some others.—This must be owing to the great similarity between the stock and the graft in all respects ; and a great contrariety or difference in structure of parts will make as remarkable a difference on the other hand. An instance of this may be observed in the plum and the elm ; which no art can ever make to succeed upon one another, whether the plum be grafted on the elm, or the elm upon the plum stock. These are examples of the extremes of easy growth, and of absolute decay ; but there are many conjunctions of trees which seem of a middle nature between the two, and neither immediately perish, nor totally succeed. Of these, such as were grafted in autumn usually remain green the whole winter without pushing ; and those which are grafted in spring remain green a month or longer, but still without shooting. Some particular ones have also been known to make a few shoots the first, or even the second sap season after the operation ; but all perish at the end of these times. Of this kind are the grafts of the pear-tree upon the elm, the maple, and the hornbeam, and the mulberry upon the elm and fig, with many others.

When we come to inquire into the cause of this, we find that these grafts, though unnatural, have yet had a communication with the stock by means of a few small vessels, which has been sufficient to keep them green, or even to make them shoot a little, during the great ascent of the sap: But the far greater number of the fibres have had all the while no communication, and are found putrified, dried up, or covered with a putrid juice. This has evidently happened by means of the disproportion in size between the vessels of the stock and of the graft, and the great difference between their natural juices, which are obstacles abundantly sufficient to prevent either an union of the fibres or the introduction of new sap.

The grafts of the almond on the plum, and of the plum on the almond, always grow very vigorously for the first year, and give all the appearances imaginable of succeeding entirely ; yet they always perish in the second or third year. The almond graft upon the plum-stock always pushes out very vigorously at first ; but the part of the stock immediately under the graft grows smaller and perishes, the graft absorbing too much of the juices, and the graft necessarily perishes with it. The decay of the whole generally happens early in the spring ; and that plainly from the different season of the natural shooting of the two trees, the almond pushing very vigorously, and consequently draining the stock of its juices, at a time when, according to its nature, the juices are but in small quantity in it, and the sap does not begin to ascend. The grafts of the plum on the almond are, from the same cause, furnished with an abundance of sap which they have at that time no occasion for ; and consequently they as certainly perish of repletion, as the other of inanition.

The peach grafted on the plum succeeds excellently, and lives longer than it would have done in a natural state ; the reason seems to be, that the peach is a tender tree, shoots with great vivacity, and produces more branches than the root is able to maintain. Thus the peach trees are usually full of dead wood ; and often

N^o 141.

their large branches perish, and sometimes their whole trunk. On this occasion the plum, being a slow shooting tree, communicates its virtue to the graft ; and the peach consequently sends out shoots which are more robust and strong, and are no more in number than the root is able to supply with nourishment, and consequently the tree is the more lasting.

The grafts, or cyons, with which the grafting is effected, are young shoots of last summer's growth, for they must not be more than one year, and such as grow on the outside branches, and robust but moderate shooters ; such also as are firm and well ripened, should always be chosen from healthful trees : observing, that the middle part of each shoot is always the best graft, cut at the time of grafting to five or six inches in length, or so as to have four or five good eyes or buds ; but should be preserved at full length till grafting time, and then prepared as hereafter directed.

They should be collected or cut from the trees in February, in mild weather, before their buds begin to swell, or advance much for shooting : in collecting them, choose such as have not made lateral or side shoots ; cut them off at full length ; and if they are not to be used as soon as they are collected, lay their lower ends in some dry earth in a warm border till grafting time, and, if severe weather should happen, cover them with dry litter.

The proper tools and other materials used in grafting, are, 1. A strong knife for cutting off the heads of the stocks, previous to the insertion of the graft ; also a small hand-saw for occasional use in cutting off the heads of large stocks. 2. A common grafting-knife, or strong sharp pen-knife, for cutting and shaping the grafts ready for insertion ; also to slope and form the stocks for the reception of the grafts. 3. A flat grafting-chisel and small mallet for clefting large stocks, in cleft-grafting, for the reception of the graft. 4. A quantity of new bass-strings for bandages, for tying the grafted parts close, to secure the grafts, and promote their speedy union with the stock. And, 5. A quantity of grafting clay, for claying closely round the grafts after their insertion and binding, to defend the parts from being dried by the sun and winds, or too much liquified by wet, or pinched by cold ; for these parts ought to be closely surrounded with a coat of clay in such a manner as effectually to guard them from all weathers, which would prove injurious to young grafts, and destroy their cementing property, so as to prevent the junction : therefore, a kind of stiff loamy mortar must be prepared of strong fat loam, or, in default thereof, any sort of tough binding clay, either of which should be laid in an heap, adding thereto about a fourth of fresh horse-dung free from litter, and a portion of cut hay, mixing the whole well together, and adding a little water : then let the whole be well beaten with a stick upon a floor, or other hard substance ; and as it becomes too dry, apply more water, at every beating turning it over, always continuing to beat it well at top till it becomes flat ; which must be repeated more or less according to the nature of the clay, but should be several times done the first day : next morning repeat the beating, still moistening it with water ; and by thus repeating the beating six or eight times every day for two or three days, or every other day at least, for a week, it will be in proper

Grafting.

Grafting. per order for use; observing, it should be prepared a week at least before it is used, but if a month the better.

The season for performing the operation of grafting is February and March: though, when the work is performed in February, it for the general part proves the most successful, more especially for cherries, plums, and pears; and March grafting is well adapted for apples.

There are different methods of grafting in practice, termed Whip-grafting—Cleft-grafting—Crown-grafting—Cheek-grafting—Side-grafting—Root-grafting—and Grafting by approach or Inarching: but Whip-grafting and Cleft-grafting are most commonly used; and Whip-grafting most of all, as being the most expeditious and successful of any.

*Marve's
Dic. of
Gardening.*

Whip-grafting.—This being the most successful method of grafting is the most commonly practised in all the nurseries; it is always performed upon small stocks, from about the size of a goose-quill to half an inch or a little more or less in diameter, but the nearer the stock and graft approach in size the better; and is called *whip-grafting*, because the grafts and stocks being nearly of a size, are sloped on one side, so as to fit each other, and tied together in the manner of whips, or joints of angling-rods, &c. and the method is as follows. Having the cyons or grafts, knife, bandages, and clay ready, then begin the work by cutting off the head of the stock at some clear smooth part thereof; this done, cut one side sloping upward, about an inch and half or near two inches in length, and make a notch or small slit near the upper part of the slope downward about half an inch long, to receive the tongue of the cyon; then prepare the cyon, cutting it to five or six inches in length, forming the lower end also in a sloping manner, so as exactly to fit the sloped part of the stock, as if cut from the same place, that the rinds of both may join evenly in every part; and make a slit so as to form a sort of tongue to fit the slit made in the slope of the stock; then place the graft, inserting the tongue of it into the slit of the stock, applying the parts as evenly and close as possible; and immediately tie the parts close together with a string of bass, bringing it in a neat manner several times round the stock and graft; then clay the whole over near an inch thick on every side, from about half an inch or more below the bottom of the graft, to an inch over the top of the stock, finishing the whole coat of clay in a kind of oval globular form, rather longwise, up and down, closing it effectually about the cyon, and every part, so as no sun, wind, nor wet may penetrate, to prevent which is the whole intention of claying; observing to examine it now and then, to see if it any where cracks or falls off, and if it does it must be instantly repaired with fresh clay. This sort of grafting may also be performed, if necessary, upon the young shoots of any bearing tree, if intended to alter the sorts of fruits, or have more than one sort on the same tree. By the middle or latter end of May, the grafts will be well united with the stock, as will be evident by the shooting of the graft; then the clay should be wholly taken away; but suffer the bass bandage to remain some time longer until the united parts seem to swell and be too much confined by the ligature, then take the tying wholly off. Their farther culture is directed under

Grafting. the respective articles, whether designed for dwarfs or standards, &c.

Cleft-grafting.—This is so called, because the stock being too large for whip-grafting is cleft or slit down the middle for the reception of the graft; and is performed upon stocks from about one to two inches diameter. First, with a strong knife cut off the head of the stock; or if the stock is very large, it may be headed with a saw; and cut one side sloping upwards about an inch and half to the top; then proceed with a strong knife or chisel, to cleave the stock at top, cross-way the slope, fixing the knife or chisel towards the back of the slope, and with your mallet strike it, so as to cleave the stock about two inches, or long enough to admit the graft, keeping it open with the chisel; this done, prepare the cyon, cutting it to such length as to leave four or five eyes, the lower part of which being sloped on each side, wedge-fashion, an inch and half or two inches long, making one side to a thin edge, the other much thicker, leaving the rind thereon, which side must be placed outward in the stock; the cyon being thus formed, and the cleft in the stock being made and kept open with the chisel, place the graft therein at the back of the stock the thickest side outward, placing the whole cut part down into the cleft of the stock, making the rind of the stock and graft join exactly; then removing the grafting chisel, each side of the cleft will closely squeeze the graft, so as to hold it fast; it is then to be bound with a ligature of bass, and clayed over, as observed in whip-grafting, leaving three or four eyes of the cyons uncovered. If intended to graft any pretty large stocks or branches by this method, two or more grafts may be inserted in each; in this case the head must be cut off horizontally, making no slope on the side, but smooth the top, then cleave it quite a-cross, and place a graft on each side, as the stock may be cleft in two places, and insert two grafts in each cleft; they are thus to be tied and clayed as in the other methods. This method of grafting may be performed upon the branches of bearing trees, when intended either to renew the wood or change the sort of fruit. Towards the latter end of May, or the beginning of June, the junction of the graft and stock in either method will be effectually formed, and the graft begin to shoot, when the clay may be taken off, and in a fortnight or three weeks after take off also the bandages.

Crown-grafting.—This kind of grafting is commonly practised upon such stocks as are too large to cleave, and is often performed upon the large branches of apple and pear trees, &c. that already bear fruit, when it is intended to change the sorts, or renew the tree with fresh-bearing wood. It is termed *crown-grafting*, because the stock or branch being headed down, several grafts are inserted at top all around betwixt the wood and bark, so as to give it a crown-like appearance: observing, that this kind of grafting should not be performed until March or early in April; for then the sap being in motion, renders the bark and wood of the stock much easier to be separated for the admission of the graft.—The manner of performing this sort of grafting is as follows: First, cut off the head of the stock or branch with a saw horizontally, and pare the top smooth; then having the grafts, cut one side of each flat, and somewhat sloping, an inch and

Grafting. a half, forming a sort of shoulder at top of the slope to rest upon the crown of the stock; and then raising the rind of the stock with a wedge, so as to admit the cyon between that and the wood two inches down, place the grafts with the flat side next the wood, thrusting it down far enough for the shoulder to rest upon the top of the stock; and in this manner may be put three, four, five, or more grafts in one large stock or branch. When the grafts are all thus inserted, let the whole be tied tight and well clayed: observing to leave two or three eyes of each graft uncovered, but raising the clay an inch above the top of the stock, so as to throw the wet quickly off, without lodging about the grafted parts, which would ruin the whole work. Crown-grafting may also be performed, by making several clefts in the crown of the stock, and inserting the grafts round the top of the clefts. The grafts will be pretty well united with the stock, and exhibit a state of growth, by the end of May or beginning of June, and the clay may then be taken away. The trees grafted by this method will succeed extremely well; but, for the first two or three years, have this inconvenience attending them, of being liable to be blown out of the stock by violent winds; which must be remedied by tying long sticks to the body of the stock or branch, and each graft tied up to one of the sticks.

Cheek-grafting.—Cut the head of the stock off, horizontally, and pare the top smooth; then cut one side sloping an inch and half or two inches deep, and cut the lower part of the graft sloping the same length, making a sort of shoulder at top of the sloped part: it is then to be placed upon the sloped part of the stock, resting the shoulder upon the crown of it: bind it with bafs, and finish with a covering of clay as in the other methods.

Side-grafting.—This is done by inserting grafts into the sides of the branches without heading them down; and may be practised upon trees to fill up any vacancy, or for the purpose of variety, to have several sorts of apples, pears, plums, &c. upon the same tree. It is performed thus. Fix upon such parts of the branches where wood is wanted to furnish the head or any part of the tree; there slope off the bark and a little of the wood, and cut the lower end of the grafts to fit the part as near as possible; then join them to the branch, and tie them with bafs, and clay them over.

Root-grafting.—This is done by Whip-grafting cyons upon pieces of the root of any tree of the same genus, and planting the root where it is to remain; it will take root, draw nourishment, and feed the graft.

Grafting by Approach, or Inarching.—This sort of grafting is, when the stocks designed to be grafted, and the tree from which you intend to take the graft, either grow so near, or can be placed so near together, that the branch or graft may be made to approach the stock, without separating it from the tree, till after its union or junction with the stock; so that the branch or graft being bent to the stock, they together form a sort of arch; whence it is called Grafting by Approach, or Inarching. Being a sure method, it is commonly practised upon such trees as are with difficulty made to succeed by any of the former ways of grafting. When intended to propagate any kind of tree or shrub by this method of grafting, if the tree, &c.

is of the hardy kind, and growing in the full ground, a proper quantity of young plants for stocks must be set round it; and when grown of a proper height, the work of inarching must be performed; or, if the branches of the tree you design to graft from is too high for the stocks, in that case stocks must be planted in pots, and a slight stage must be erected around the tree, of due height to reach the branches, and the pots containing the stocks must be placed upon the stage. As to the method of performing the work: Observe, that in this method of grafting, it is sometimes performed with the head of the stock cut off, and sometimes with the head left on till the graft is united with the stock; though, by previously heading the stock, the work is much easier performed; and having no top, its whole effort will be directed to the nourishment of the graft; having, however, the stocks properly placed, either planted in the ground, or in pots around the tree to be propagated; then make the most convenient branches approach the stock, and mark on the body of the branches the parts where they will most easily join to the stock, and in those parts of each branch pare away the bark and part of the wood two or three inches in length, and in the same manner pare the stock in the proper place for the junction of the graft; then make a slit upwards in the branch, so as to form a sort of tongue, and make a slit downwards in the stock to admit it; let the parts be then joined, slipping the tongue of the graft into the slit of the stock, making the whole join in an exact manner, and tie them closely together with bafs, and afterwards cover the whole with a due quantity of clay, as before directed in the other methods. After this, let a stout stake be fixed, if possible, for the support of each graft; to which let that part of the stock and graft be fastened, which is necessary to prevent their being disjoined by the wind. The operation being performed in spring, let them remain in that position about four months, when they will be united, and the graft may then be separated from the mother-tree. In doing this, be careful to perform it with a steady hand, so as not to loosen or break out the graft, sloping it off downwards close to the stock; and if the head of the stock was not cut down at the time of grafting, it must now be done close to the graft, and all the old clay and bandage must also be cleared away, and replaced with new, to remain a few weeks longer. Observe, however, that if you shall think the grafts are not firmly united with the stock in the period of time above mentioned, let them remain another year till autumn, before you separate the grafts from the parent-tree. By this kind of grafting, you may raise almost any kind of tree or shrub, which is often done by way of curiosity, to ingraft a fruit-bearing branch of a fruit-tree upon any common stock of the same fraternity or genus, whereby a new tree bearing fruit is raised in a few months. This is sometimes practised upon orange and lemon trees, &c. by grafting bearing-branches upon stocks raised from the kernels of any of the same kind of fruit, or into branches of each other, so as to have oranges, lemons, and citrons, all on the same tree.

An anonymous author has given us in a treatise, published at Hamburgh, under the title *Amenitates Hortensæ Novæ*, a new method of grafting trees, so

Grafting,
Graham.

as to have very beautiful pyramids of fruit upon them, which will exceed in beauty, flavour, and quantity, all that can be otherwise produced. This, he says, he had long experienced, and gives the following method of doing it. The trees are to be transplanted in autumn, and all their branches cut off. Early in the following summer the young shoots are to be pulled off, and the buds are then to be ingrafted into them in an inverted direction. This, he says, adds not only to the beauty of the pyramids, but also makes the branches more fruitful. These are to be closely connected to the trunk, and to be fastened in with the common ligature: they are to be placed circularly round the tree, three buds in each circle, and these circles at six inches distance from one another. The old trees may be grafted in this manner, the success having been found very good in those of twenty years standing; but the most eligible trees are those which are young, vigorous, and full of juice, and are not above a finger or two thick. When these young trees are transplanted, they must be fenced round with pales to defend them from the violence of the wind; and there must be no dung put to them till they are thoroughly rooted, for fear of rotting them before the fibres strike. The buds ingrafted must be small, that the wounds made in the bark to receive them, not being very large, may heal the sooner; and if the buds do not succeed, which will be perceived in a fortnight, there must be others put in their place. The wound made to receive these buds must be a straight cut, parallel to the horizon; and the piece of bark taken out must be downward, that the rain may not get in at the wound. In the autumn of the same year, this will be a green and flourishing pyramid; and the next summer it will flower, and ripen its fruit in autumn.

GRAHAM (James), Marquis of Montrose, was comparable to the greatest heroes of antiquity. He undertook, against almost every obstacle that could terrify a less enterprising genius, to reduce the kingdom of Scotland to the obedience of the king; and his success was answerable to the greatness of the undertaking. By valour, he in a few months almost effectuated his design; but, for want of supplies, was forced to abandon his conquests. After the death of Charles I. he, with a few men, made a second attempt, but was immediately defeated by a numerous army. As he was leaving the kingdom in disguise, he was betrayed into the hands of his enemy, by the Lord Aston, his intimate friend. He was carried to his execution with every circumstance of indignity that wanton cruelty could invent; and hanged upon a gibbet 30 feet high, with the book of his exploits appended to his neck. He bore this reverse of fortune with his usual greatness of mind, and expressed a just scorn at the rage and the insult of his enemies. We meet with many instances of valour in this active reign; but Montrose is the only instance of heroism. He was executed May 21st, 1650. See BRITAIN, n° 137, 138, 143, 165.

GRAHAM (Sir Richard), lord viscount Preston, eldest son of Sir George Graham of Netherby, in Cumberland, Bart. was born in 1648. He was sent ambassador by Charles II. to Louis XIV. and was master of the wardrobe and secretary of state under James II. But when the Revolution took place, he was tried

and condemned, on an accusation of attempting the restoration of that prince; though he obtained a pardon by the queen's intercession. He spent the remainder of his days in retirement, and published an elegant translation of "Boethius on the consolation of philosophy." He died in 1695.

GRAHAM (George), clock and watch maker, the most ingenious and accurate artist in his time, was born in 1675. After his apprenticeship, Mr Tompion received him into his family, purely on account of his merit; and treated him with a kind of parental affection as long as he lived. Beside his universally acknowledged skill in his profession, he was a complete mechanic and astronomer; the great mural arch in the observatory at Greenwich was made for Dr Halley, under his immediate inspection, and divided by his own hand: and from this incomparable original, the best foreign instruments of the kind are copies made by English artists. The sector by which Dr Bradley first discovered two new motions in the fixed stars, was of his invention and fabric: and when the French academicians were sent to the north to ascertain the figure of the earth, Mr Graham was thought the fittest person in Europe to supply them with instruments; those who went to the south were not so well furnished. He was for many years a member of the Royal Society, to which he communicated several ingenious and important discoveries; and regarded the advancement of science more than the accumulation of wealth. He died in 1751.

GRAHAM's Dyke. See ANTONINUS's Wall.

GRAIN, corn of all sorts, as barley, oats, rye, &c. See CORN, WHEAT, &c.

GRAIN is also the name of a small weight, the twentieth part of a scruple in apothecaries weight, and the twenty-fourth of a penny-weight troy.

A grain-weight of gold-bullion is worth two-pence, and that of silver but half a farthing.

GRAIN also denotes the component particles of stones and metals, the veins of wood, &c. Hence cross-grained, or against the grain, means contrary to the fibres, of wood, &c.

GRAIN (Baptist le), master of the requests in ordinary to Mary de Medicis queen of France's household, wrote *The History of Henry the Great*, and of *Louis XIII.* from the beginning of his reign to the death of the marshal d'Ancre in 1617. This history is reckoned to be wrote with impartiality, and the spirit of a true patriot; and contains many things not to be found any where else. He vigorously asserts the edict that had been granted to the reformed.

GRALLÆ, in ornithology, is an order of birds analogous to the *bruta* in the class of *mammalia*, in the Linnæan system. See ZOOLOGY and ORNITHOLOGY.

GRAMINA, GRASSES; one of the seven tribes or natural families, into which all vegetables are distributed by Linnæus in his *Philosophia Botanica*. They are defined to be plants which have very simple leaves, a jointed stem, a husky calyx termed *gluma*, and a single seed. This description includes the several sorts of corn as well as grasses. In Tournefort they constitute a part of the fifteenth class, termed *apetalæ*; and in Linnæus's sexual method, they are mostly contained in the second order of the third class, called *triandria digynia*.

Graham
Gramina.

Gramina.

This numerous and natural family of the grasses has engaged the attention and researches of several eminent botanists. The principal of these are, Ray, Monti, Micheli, and Linnæus.

M. Monti, in his *Catalogus stirpium agri Bononiensis gramina ac hujus modi affinia complectens*, printed at Bononia in 1719, divides the grasses from the disposition of their flowers, as, Theophrastus and Ray has divided them before him into three sections or orders—These are, 1. Grasses having flowers collected in a spike. 2. Grasses having their flowers collected in a panicle or loose spike. 3. Plants that in their habit and external appearance are allied to the grasses.

This class would have been natural if the author had not improperly introduced sweet-rush, juncus, and arrow-headed grass, into the third section. Monti enumerates about 306 species of the grasses, which he reduces under Tournefort's genera; to these he has added three new genera.

Scheuchzer, in his *Aristographia*, published likewise in 1719, divides the grasses, as Monti, from the disposition of their flowers, into the five following sections: 1. Grasses with flowers in a spike, as phalaris, anthoxanthum, and frumentum. 2. Irregular grasses, as schœnanthus and cornucopiæ. 3. Grasses with flowers growing in a simple panicle or loose spike, as reed and millet. 4. Grasses with flowers growing in

a compound panicle, or diffused spike, as oats and poa. 5. Plants by their habit nearly allied to the grasses, as cypress-grass, scirpus, linagrostis, rush, and sceuchzeria.

Scheuchzer has enumerated about four hundred species, which he describes with amazing exactness.

Micheli has divided the grasses into six sections, which contain in all 44 genera, and are arranged from the situation and number of the flowers.

GRAMINA, the name of the fourth order in Linnæus's *Fragments of a Natural Method*, consisting of the numerous and natural family of the grasses, viz. agrostis, aira, alopecurus or fox-tail grass, anthoxanthum or vernal grass, aristida arundo or reed, avena or oats, bobartia, briza, bromus, cinna, cornucopiæ or horn of plenty grass, cynosurus, dactylis, elymus, festuca or fescue-grass, hordeum or barley, lagurus or hare's-tail grass, lolium or darnel, lygeum or hooded matweed, melica, mileum or millet, nardus, oryza or rice, panicum or panic-grass, paspalum, phalaris or canary-grass, phleum, poa, saccharum or sugar-cane, secale or rye, stipa or winged spike-grass, triticum or wheat, uniola or sea-side oats of Carolina, coix or Job's tears, olyra, pharus, triplicum, zea, Indian Turkey wheat or Indian corn, zizania, ægilops or wild fescue-grass, andropogon, apluda, cenchrus, holcus or Indian millet, ischæmum. See BOTANY, p. 458, col. 2. and GRASSES.

1
Definition.

1. GRAMMAR is the art of speaking or of writing any language with propriety; and the purpose of language is to communicate our thoughts.

2
Grammar particular,

2. Grammar, considered as an art, necessarily supposes the previous existence of language; and as its design is to teach any language to those who are ignorant of it, it must be adapted to the genius of that particular language of which it treats. A just method of grammar, therefore, without attempting any alterations in a language already introduced, furnishes certain observations called rules, to which the methods of speaking used in that language may be reduced; and this collection of rules is called the grammar of that particular language. For the greater distinctness with regard to these rules, grammarians have usually divided this subject into four distinct heads, viz. ORTHOGRAPHY, or the art of combining letters into syllables, and syllables into words; ETYMOLOGY, or the art of deducing

one word from another, and the various modifications by which the sense of any one word can be diversified consistently with its original meaning or its relation to the theme whence it is derived; SYNTAX, or what relates to the construction or due disposition of the words of a language into sentences or phrases; and PROSODY, or that which treats of the quantities and accents of syllables, and the art of making verses.

3. But grammar, considered as a science, views language only as it is significant of thought. Neglecting particular and arbitrary modifications introduced for the sake of beauty or elegance, it examines the analogy and relation between words and ideas; distinguishes between those particulars which are essential to language and those which are only accidental; and thus furnishes a certain standard, by which different languages may be compared, and their several excellencies or defects pointed out. This is what is called PHILOSOPHIC OR

3
Or universal.

UNIVERSAL GRAMMAR.

4
The design of speech.

4. THE origin of language is a subject which has employed much learned investigation, and about which there is still a diversity of opinion. The design of speech is to communicate to others the thoughts and perceptions of the mind of the speaker: but it is obvious, that between an internal idea and any external sound there is no natural relation; that the word fire, for instance, might have denominated the substance which we call ice, and that the word ice might have signified fire. Some of the most acute feelings of man,

as well as of every other animal, are indeed expressed by simple inarticulate sounds, which as they tend to the preservation of the individual or the continuance of the species, and invariably indicate either pain or pleasure, are universally understood: but these inarticulate and significant sounds are very few in number; and if they can with any propriety be said to constitute a natural and universal language, it is a language of which man as a mere sensitive being partakes in common with the other animals.

5. Man

5
Language
consists of
words sig-
nificant of
ideas.

5. Man is endowed not only with *sensation*, but also with the faculty of *reasoning*; and simple inarticulate sounds are insufficient for expressing all the various modifications of thought, for communicating to others a chain of argumentation, or even for distinguishing between the different sensations either of pain or of pleasure: a man scorched with fire or unexpectedly plunged among ice, might utter the cry naturally indicative of sudden and violent pain; the cry would be the same, or nearly the same, but the sensations of cold and heat are widely different. *Articulation*, by which those simple sounds are modified, and a particular meaning fixed to each modification, is therefore absolutely necessary to such a being as man, and forms the language which distinguishes him from all other animals, and enables him to communicate with facility all that diversity of ideas with which his mind is stored, to make known his particular wants, and to distinguish with accuracy all his various sensations. Those sounds thus modified are called *WORDS*; and as words have confessedly no *natural* relation to the ideas and perceptions of which they are significant, the use of them must either have been the result of human sagacity, or have been suggested to the first man by the Author of nature.

6. Whether language be of divine or human origin, is a question upon which, though it might perhaps be soon resolved, it is not necessary here to enter. Upon either supposition, the first language, compared with those which succeeded it, or even with itself as afterwards enlarged, must have been extremely rude and narrow. If it was of *human* contrivance, this will be readily granted; for what art was ever invented and brought to a state of perfection by illiterate savages? If it was taught by God, which is at least the more probable supposition, we cannot imagine that it would be more comprehensive than the ideas of those for whose immediate use it was intended; that the first men should have been taught to express pains or pleasures which they never felt, or to utter sounds that should be afterwards significant of ideas which at the time of utterance had not occurred to the mind of the speaker: man, taught the elements of language, would be able himself to improve and enlarge it as his future occasions should require.

6
Origin of
ideas.
7. As all language is composed of significant *words* variously combined, a knowledge of them is necessary previous to our acquiring an adequate idea of language as constructed into sentences and phrases. But as it is by words that we express the various *ideas* which occur to the mind, it is necessary to examine how ideas themselves are suggested, before we can ascertain the various classes into which words may be distributed. It is the province of *logic* to trace our ideas from their

origin, as well as to teach the art of reasoning: but it is necessary at present to observe, that our earliest ideas are all ideas of sensation, excited by the impressions that are made upon our organs of sense by the various objects with which we are surrounded. Let us therefore suppose a reasonable being, devoid of every possible prepossession, placed upon this globe; and it is obvious, that his attention would in the first place be directed to the various objects which he saw existing around him. These he would naturally endeavour to distinguish from one another; and if he were either learning or inventing a language, his first effort would be to give them *names*, by means of which the ideas of them might be recalled when the objects themselves should be absent. This is one copious source of words; and forms a natural class which must be common to every language, and which is distinguished by the name of *NOUNS*: and as these nouns are the names of the several substances which exist, they have likewise been called *SUBSTANTIVES*.

7
Of nouns.

8. It would likewise be early discovered, that every one of these substances was endowed with certain qualities or attributes; to express which another class of words would be requisite, since it is only by their qualities that substances themselves can attract our attention. Thus, *to be weighty*, is a quality of matter; *to think*, is an attribute of man. Therefore in every language words have been invented to express the known qualities or attributes of the several objects which exist. These may all be comprehended under the general denomination of *ATTRIBUTIVES*.

8
Of attrib-
utives.

9. *NOUNS* and *ATTRIBUTIVES* must comprehend all that is *essential* to language (A): for every thing which exists, or of which we can form an idea, must be either a *substance* or the *attribute* of some substance; and therefore those two classes which denominate substances and attributes, must comprehend all the words that are *necessary* to communicate to the hearer the ideas which are present to the mind of the speaker. If any other words occur, they can only have been invented for the sake of dispatch, or introduced for the purposes of ease and ornament, to avoid tedious circumlocutions or disagreeable tautologies. There are indeed grammarians of great name, who have considered as essential to language an order of words, of which the use is to connect the nouns and attributives, and which are said to have *no signification of themselves*, but to become *significant by relation*. Hence all words which can possibly be invented are by these men divided into two general classes: those which are *SIGNIFICANT OF THEMSELVES* and those which are *NOT*. Words significant of themselves are either expressive of the names of substances, and therefore called *SUBSTANTIVES*; or of

of

(A) This is the doctrine of many writers on the theory of language, for whose judgment we have the highest respect: yet it is not easy to conceive mankind so far advanced in the art of abstraction as to view *attributes* by themselves independent of particular *substances*, and to give *one general name* to *each attribute* wheresoever it may be found, without having at the same time words expressive of *affirmation*. We never talk of any *attribute*, a *colour* for instance, without *affirming* something concerning it; as, either that it is *bright* or *faint*, or that it is the colour of some *substance*. It will be seen afterwards, that to denote *affirmation* is the proper office of what is called the *substantive-verb*; as, "Milk *is* white." That *verb* therefore appears to be as necessary to the communication of thought as any species of words whatever; and if we must range words under a few general classes, we should be inclined to say, that *nouns*, *attributives*, and *affirmatives*, comprehend all that is essential to language.

9
Of definitives and connectives.

of attributes, and therefore called ATTRIBUTIVES. Words which are not significant of themselves, must acquire a meaning either as defining or connecting others; and are therefore arranged under the two classes of DEFINITIVES and CONNECTIVES.

10. That in any language there can be words which of themselves have *no signification*, is a supposition which a man free from prejudice will not readily admit; for to what purpose should they have been invented? as they are significant of no ideas, they cannot facilitate the communication of thought, and must therefore be only an incumbrance to the language in which they are found. But in answer to this it has been said, that these words, though devoid of signification themselves, acquire a sort of meaning when joined with others, and that they are as necessary to the structure of a sentence as cement is to the structure of an edifice: for as *stones* cannot be arranged into a regular building without a *cement* to bind and connect them, so the original words significant of *substances* and *attributes*, cannot be made to express all the variety of our ideas without being *defined* and *connected* by those words which of themselves signify *nothing*.—It is wonderful, that he who first suggested this simile did not perceive that it tends to overthrow the doctrine which it is meant to illustrate: for surely the *cement* is as much the *matter* of the building as the *stones* themselves; it is equally solid and equally extended. By being united with the stones, it neither acquires nor loses any one of the qualities *essential* to *matter*; it neither communicates its own softness, nor acquires their hardness. By this mode of reasoning therefore it would appear, that the words called *definitives* and *connectives*, so far from having of themselves *no* signification, are equally essential to language and equally significant with those which are denominated *substantives* and *attributives*; and upon investigation it will be found that this is the truth. For whatever is meant by the *definition* or *connection* of the words which *all men* confess to be significant, *that meaning* must be the sense of the words of which the purpose is to define and connect; and as there can be no *meaning* where there are no *ideas*, every one of these *definitives* and *connectives* must be significant of *some idea*, although it may not be always easy or even possible to express that idea by another word.

11. These different modes of dividing the parts of speech we have just mentioned, because they have been largely treated of by grammarians of high fame. But it does not appear to us, that any man can feel himself much the wiser for having learned that all words are either SUBSTANTIVES or ATTRIBUTIVES, DEFINITIVES or CONNECTIVES. The division of words into those which are SIGNIFICANT OF THEMSELVES, and those which are SIGNIFICANT BY RELATION, is absolute nonsense, and has been productive of much error and much mystery in some of the most celebrated treatises on grammar. It is indeed probable, that any attempt to establish a different classification of the parts of speech from that which is commonly received, will be found of little utility either in *practice* or in *speculation*. As far as the *former* is concerned, the vulgar division seems sufficiently commodious; for every man who knows any thing, knows when he uses a *noun* and when a *verb*. With respect to the *latter*, not to mention that all the grammarians from ARISTOTLE to

HORNE TOOKE, have differed on the subject, it should seem to be of more importance, after having ascertained with precision the nature of each species of words, to determine in what circumstances they *differ* than in what they *agree*.

12. In most languages, probably in all cultivated languages, grammarians distinguish the following parts of speech: *Noun, pronoun, verb, participle, adverb, preposition, conjunction*. The *Latin* and *English* grammarians admit the *interjection* among the parts of speech, although it is confessedly not necessary to the construction of the sentence, being only thrown in to express the affection of the speaker; and in the *Greek* and *English* tongues there is the *article* prefixed to nouns, when they signify the common names of *things*, to point them out, and to show how far their signification extends. In the method of arrangement commonly followed in grammars, *adjectives* are classed with *substantives*, and both are denominated *nouns*; but it is certain that, when examined philosophically, an essential difference is discovered between the *substantive* and the *adjective*; and therefore some writers of eminence, when treating of this subject, have lately given the following classification of words, which we shall adopt: The ARTICLE, NOUN, PRONOUN, VERB, PARTICIPLE, ADJECTIVE, ADVERB, PREPOSITION, CONJUNCTION, INTERJECTION. All these words are to be found in the *English* language; and therefore we shall examine each class, endeavour to ascertain its precise import, and show in what respects it differs from every other class. It is impossible to investigate the principles of grammar without confining the investigation in a great measure to some particular language from which the illustrations must be produced; and that we should prefer the *English* language for this purpose can excite no wonder, as it is a preference which to every tongue is due from those by whom it is spoken. We trust, however, that the principles which we shall establish will be found to apply *universally*; and that our inquiry, though *principally* illustrated from the *English* language, will be an enquiry into *philosophical* or *universal* grammar.

CHAPTER I.

Of the NOUN or SUBSTANTIVE.

13. NOUNS are all those words by which objects or substances are denominated, and which distinguish them from one another, without marking either quantity, quality, action, or relation. The *substantive* or *noun* is the name of the thing spoken of, and in *Greek* and *Latin* is called *name*; for it is *ονομα* in the one, and *nomen* in the other; and if in *English* we had called it the *name* rather than the *noun*, the appellation would perhaps have been more proper, as this last word, being used only in *grammar*, is more liable to be misunderstood than the other, which is in *constant* and *familiar* use. That *nouns* or the names of things must make a part of every language, and that they must have been the words first suggested to the human mind, will not be disputed. Men could not speak of themselves or of any thing else, without having names for themselves and the various objects with which they are surrounded. Now, as all the objects which exist must be either in the same state in which they were produced by *nature*, or changed from their original state by *art*, or *abstracted*

10
The common division of the parts of speech the most proper.

11
The noun defined.

12
Different
kinds of
nouns.

ed from substances by the powers of imagination, and conceived by the mind as having at least the capacity of being characterized by qualities; this naturally suggests a division of nouns into NATURAL, as *man*, *vegetable*, *tree*, &c. ARTIFICIAL, as *house*, *ship*, *watch*, &c. and ABSTRACT, as *whiteness*, *motion*, *temperance*, &c.

13
Nouns ge-
neral
terms.

14. But the diversity of objects is so great, that had each individual a distinct and proper name, it would be impossible for the most tenacious memory, during the course of the longest life, to retain even the nouns of the narrowest language. It has therefore been found expedient, when a number of things resemble each other in some important particulars, to arrange them all under one species; to which is given a name that belongs equally to the whole species, and to each individual comprehended under it. Thus the word *man* denotes a species of animals, and is equally applicable to every human being: The word *horse* denotes another species of animals, and is equally applicable to every individual of that species of quadrupeds; but it cannot be applied to the species of men, or to any individual comprehended under that species. We find, however, that there are some qualities in which several species resemble each other; and therefore we refer them to a higher order called a genus, to which we give a name that is equally applicable to every species and every individual comprehended under it. Thus, *men* and *horses* and all living things on earth resemble each other in this respect, that they have life. We refer them therefore to the genus called *animal*; and this word belongs to every species of animals, and to each individual animal. The same classification is made both of artificial and abstract substances; of each of which there are genera, species, and individuals. Thus in natural substances, *animal*, *vegetable*, and *fossile*, denote GENERA; *man*, *horse*, *tree*, *metal*, are SPECIES; and *Alexander*, *Bucephalus*, *oak*, *gold*, are INDIVIDUALS. In artificial substances, *edifice* is a GENUS; *house*, *church*, *tower*, are SPECIES; and the *Vatican*, *St Paul's*, and the *Tower of London*, are INDIVIDUALS. In abstract substances, *motion* and *virtue* are GENERA; *flight* and *temperance* are SPECIES; the *flight of Mahomet* and *temperance in wine* are INDIVIDUALS. By arranging substances in this manner, and giving a name to each genus and species, the nouns necessary to any language are comparatively few and easily acquired: and when we meet with an object unknown to us, we have only to examine it with attention; and comparing it with other objects, to refer it to the genus or species which it most nearly resembles. By this contrivance we supply the want of a proper name for the individual; and so far as the resemblance is complete between it and the species to which it is referred, and of which we have given it the name, we may converse and reason about it without danger of error: Whereas had each individual in nature a distinct and proper name, words would be innumerable and incomprehensible; and to employ our labours in language, would be as idle as that study of numberless written symbols which has been attributed to the Chinese.

14
The origin
of the sin-
gular and
plural num-
bers.

15. Although nouns are thus adapted to express not the individuals but the genera or species into which substances are classed; yet, in speaking of these substances, whether natural, artificial, or abstract, all men must have occasion to mention sometimes one of a kind, and sometimes more than one. In every language, therefore, nouns must admit of some variation in their form, to denote

unity and plurality; and this variation is called *number*. Thus in the English language, when we speak of a single place of habitation, we call it a *house*; but if of more, we call them *houses*. In the first of these cases the noun is said to be in the *singular*, in the last case it is in the *plural*, number. Greek nouns have also a *dual* number to express two individuals, as have likewise some Hebrew nouns: but this variation is evidently not essential to language; and it is perhaps doubtful whether it ought to be considered as an elegance or a deformity.

16. But although number be a natural accident of nouns, it can only be considered as *essential* to those which denote genera or species. Thus we may have occasion to speak of *one animal* or of *many animals*, of *one man* or of *many men*; and therefore the nouns *animal* and *man* must be capable of expressing *plurality* as well as *unity*. But this is not the case with respect to the proper names of individuals: for we can only say *Xenophon*, *Aristotle*, *Plato*, &c. in the *singular*; as, were any one of these names to assume a *plural* form, it would cease to be the proper name of an individual, and become the common name of a species. Of this, indeed, we have some examples in every language. When a proper name is considered as a general appellative under which many others are arranged, it is then no longer the name of an individual but of a species, and as such admits of a *plural*; as the *Cæsars*, the *Howards*, the *Pelhams*, the *Montagues*, &c.: but *Socrates* can never become *plural*, so long as we know of no more than one man of that name. The reason of all this will be obvious, if we consider, that every genus may be found whole and entire in each of its species; for *man*, *horse*, and *dog*, are each of them an entire and complete animal: and every species may be found whole and entire in each of its individuals: for *Socrates*, *Plato*, and *Xenophon*, are each of them completely and entirely a man. Hence it is, that every genus, though ONE, is multiplied into MANY; and every species, though ONE, is also multiplied into MANY, by reference to those beings which are their subordinates: But as no individual has any such subordinates, it can never in strictness be considered as MANY; and so, as well in nature as in name, is truly an INDIVIDUAL which cannot admit of number.

15
Of genders.

17. Besides number, another characteristic, visible in substances, is that of SEX. Every substance is either male or female; or both male and female; or neither one nor the other. So that with respect to sexes and their negation, all substances conceivable are comprehended under this fourfold consideration, which language would be very imperfect if it could not express. Now the existence of hermaphrodites being rare, if not doubtful, and language being framed to answer the ordinary occasions of life, no provision is made, in any of the tongues with which we are acquainted, for expressing, otherwise than by a name made on purpose, or by a periphrasis, *duplicity of sex*. With regard to this great natural characteristic, grammarians have made only a threefold distinction of nouns: those which denote males are said to be of the *masculine gender*; those which denote females, of the *feminine*; and those which denote substances that admit not of sex, are said to be *neuter* or of *neither gender*. All animals have sex; and therefore the names of all animals should have gender. But the sex of all is not equally obvious, nor equally worthy of attention. In those species that are most common, or

of which the *male* and the *female* are, by their *size*, *form*, *colour*, or other outward circumstances, *eminently distinguished*, the *male* is sometimes called by *one* name, which is *masculine*; and the *female* by a *different* name, which is *feminine*. Thus in English we say, *husband*, *wife*; *king*, *queen*; *father*, *mother*; *son*, *daughter*, &c. In others of similar distinction, the name of the *male* is applied to the *female* only by prefixing a syllable or by altering the termination; as *man*, *woman*; *lion*, *lioness*; *emperor*, *empress*, anciently *emperefs*; *master*, *mistress*, anciently *masterefs*, &c. When the *sex* of any animal is not obvious, or not material to be known, the same name, in some languages, is applied, without variation, to *all* the *species*, and that name is said to be of the *common gender*. Thus in Latin *bos albus* is a white ox, and *bos alba* a white cow. Diminutive insects, though they are doubtless *male* and *female*, seem to be considered in the English language as if they were really *creeping things*. No man, speaking of a *worm*, would say *he* creeps, but *it* creeps, upon the ground. But although the origin of *genders* is thus clear and obvious; yet the English is the only language, with which we are acquainted, that deviates not, except in this single instance of insects, from the order of nature. *Greek* and *Latin*, and many of the modern tongues, have nouns, some *masculine*, some *feminine*, which denote substances where *sex* never had existence. Nay, some languages are so particularly defective in this respect, as to class every object, inanimate as well as animate, under either the *masculine* or the *feminine gender*, as they have no *neuter gender* for those which are of neither sex. This is the case with the *Hebrew*, *French*, *Italian*, and *Spanish*. But the *English*, strictly following the order of nature, puts every noun which denotes a *male* animal, and no other, in the *masculine gender*; every name of a *female* animal, in the *feminine*; and every animal whose *sex* is not *obvious* or *known*, as well as every *inanimate* object whatever, in the *neuter gender*. And this gives our language an advantage above most others in the poetical and rhetorical style: for when nouns naturally *neuter* are converted into *masculine* and *feminine*, the *personification* is more distinctly and more forcibly marked. (See PERSONIFICATION.) Some very learned and ingenious men have endeavoured, by what they call a more subtle kind of reasoning, to discern even in *things without sex* a distant analogy to that NATURAL DISTINCTION, and to account for the names of inanimate substances being, in *Greek* and *Latin*, *masculine* and *feminine*. But such speculations are wholly fanciful; and the principles upon which they proceed are overturned by an appeal to facts. Many of the substances that, in one language, have *masculine names*, have in others names that are *feminine*; which could not be the case were this matter regulated by *reason* or *nature*. Indeed for this, as well as many other anomalies in language, no other reason can be assigned than that *custom* —

Quem penes arbitrium est, et jus, et norma, loquendi.

16
Origin of
cases.

18. It has been already observed that most nouns are the names, not of *individuals*, but of whole classes of objects termed *genera* and *species* (B). In classing a num-
N^c 141.

ber of *individuals* under *one species*, we contemplate only those qualities which appear to be important, and in which the several individuals are found to agree, abstracting the mind from the consideration of all those which appear to be less essential, and which in one individual may be such as have nothing exactly similar in any other individual upon earth. Thus, in classing the *individuals* which are comprehended under the *species* denominated *horse*, we pay no regard to their *colour* or their *size*; because experience teaches us, that no *particular* colour or size is essential to that individual living creature, and that there are not perhaps upon earth *two* horses whose colour and size are *exactly alike*. But the qualities which in this process we take into view, are the *general shape*, the *symmetry*, and *proportion* of the *parts*; and in short every thing which appears evidently *essential* to the *life* of the *individual* and the *propagation* of the *race*. All these qualities are strikingly similar in all the individuals which we call *horses*, and as strikingly dissimilar from the corresponding qualities of every *other* individual animal. The colour of a *horse* is often the same with that of an *ox*; but the shape of the one animal, the symmetry and proportion of his parts, are totally different from those of the other; nor could any man be led to class the *two individuals* under the *same species*. It is by a similar process that we ascend from one *species* to another, and through *all* the *species* to the highest *genus*. In each *species* or *genus* in the ascending series *fewer particular* qualities are attended to than were considered as *essential* to the *genus* or *species* immediately below it; and our *conceptions* become more and more *general* as the particular qualities, which are the objects of them, become *fewer* in number. The use of a *general term*, therefore, can recal to the mind only the *common* qualities of the *class*, the *genus* or *species* which it represents. But we have frequent occasion to speak of *individual* objects. In doing this, we annex to the *general term* certain words significant of *particular qualities*, which discriminate the object of which we speak, from every other individual of the class to which it belongs, and of which the *general term* is the *common name*. For instance, in advertising a *thief*, we are obliged to mention his *height*, *complexion*, *gait*, and whatever may serve to distinguish him from *all other men*.

The process of the mind in rendering her conceptions *particular*, is indeed exactly the reverse of that by which she *generalizes* them. For as in the process of *generalization*, she *abstracts* from her ideas of any number of *species* certain qualities in which they *differ* from each other, and of the *remaining* qualities in which they *agree*, constitutes the first *genus* in the *ascending series*; so when she wishes to make her conceptions more *particular*, she *annexes* to her idea of any *genus* those qualities or circumstances which were before abstracted from it; and the *genus*, with this *annexation*, constitutes the first *species* in the *descending series*. In like manner, when she wishes to descend from any *species* to an *individual*, she has only to *annex* to the idea of the *species* those *particular* qualities which discriminate the *individual* intended from the *other* individuals of the same kind.

This

(B) It is almost needless to observe, that the words *genus* and *species*, and the phrases *higher genus* and *lower species*, are taken here in the *logical* sense; and not as the words *genus*, *species*, *order*, *class*, are often employed by naturalists. For a farther account of the mental process of generalization, see LOGIC and METAPHYSICS.

This *particularizing* operation of the mind points out the manner of applying the *general terms* of language for the purpose of expressing *particular ideas*. For as the mind, to limit a *general idea*, connects that *idea* with the *idea* of some *particular circumstance*; so language, as we have already observed, in order to limit a *general term*, connects that *term* with the *word* denoting the *particular circumstance*. Thus, in order to particularize the *idea* of horse, the mind connects that *general idea* with the *circumstance*, suppose, of *whiteness*; and in order to particularize the *word* horse, language connects that *word* with the *term* *white*; and so in other instances.—*Annexation*, therefore, or the connecting of general words or terms in language, fits it for expressing particular conceptions; and this must hold alike good in all languages. But the methods of denoting this annexation are various in various tongues. In *English* and most modern languages we commonly use for this purpose little words, which we have chosen to style *particles*; and in the *Greek* and *Latin* languages, the *cases of nouns* answer the same end.

19. *Cases*, therefore, though they are *accidents of nouns* not absolutely necessary, have been often considered as such; and they are certainly worthy of our examination, since there is perhaps no language in which some cases are not to be found, as indeed without them or their various powers no language could readily answer the purposes of life.

17
Cases, the
marks of
annexation.

18
The im-
port of the
genitive
case.

All the *oblique cases of nouns* (if we except the *vocative*) are merely marks of *annexation*; but as the connections or relations subsisting among objects are very various, some cases denote one kind of relation, and some another. We shall endeavour to investigate the connection which each case denotes, beginning with the *genitive*.—This is the *most general* of all the cases, and gives notice that some connection indeed subsists between two objects, but does not point out the *particular kind* of connection. That we must infer, not from the nature or termination of the *genitive itself*, but from our previous knowledge of the objects connected. That the *genitive* denotes merely *relation in general*, might be proved by adducing innumerable examples, in which the relations expressed by this case are different; but we shall content ourselves with one observation, from which the truth of our opinion will appear beyond dispute. If an expression be used in which are, connected by the *genitive case*, two words significant of objects between which a *twofold* relation may subsist, it will be found impossible, from the expression, to determine which of these two relations is the *true one*, which must be gathered wholly from the context. Thus, for example, from the phrase *injuriam regis*, no man can know whether the *injury* mentioned be an *injury suffered* or an *injury inflicted* by the king: but if the *genitive case* notified any *particular relation*, no such ambiguity could exist. This case therefore gives notice, that two objects are, somehow or other (c), connected, but it marks not the *particular sort* of connection. Hence it may be translated by our particle *of*, which will be seen afterwards to be of a signification equally general.

VOL. VIII. Part I.

The *dative* and *accusative cases* appear to have nearly the same meaning; each of them denoting *apposition*, or the junction of one object with another. Thus when any one says, *Comparo Virgilium Homero*, *Homer* and *Virgil* are conceived to be placed beside one another, in order to their being compared; and this sort of connection is denoted by the *dative case*. In like manner, when it is said *latus humeros*, *breadth* is conceived as joined to or connected in *apposition* with *shoulders*; and the expression may be translated “*broad at the shoulders*.”

19
Of the da-
tive and ac-
cusative
cases.

This *apposition* of two objects may happen either without previous motion, or in consequence of it. In the foregoing instances no motion is presupposed; but if one say, *Misit aliquos subsidio eorum*, the *apposition* is there in consequence of motion. In like manner, when it is said, *Profectus est Romam*, his *apposition* with *Rome* is conceived as the effect of his motion thither.

From this idea of the *accusative*, the reason is obvious why the object after the active verb is often put in that case; it is because the action is supposed to proceed from the agent to the patient. But the same thing happens with respect to the *dative case*, and for the same reason. Thus, *Antonius læsit Ciceronem*, and *Antonius nocuit Ciceroni*, are expressions of the same import, and in each the action of *hurting* is conceived as proceeding from *Antony* to *Cicero*; which is finely illustrated by the passive form of such expressions, where the procedure above mentioned is expressly marked by the preposition *ab*: *Cicero nocetur*, *Cicero læditur ab Antonio*. It is therefore not true, that “the *accusative* is that case, at least the only case, which to an efficient nominative and a verb of action subjoins either the effect or the passive subject; nor is the *dative* the only case which is formed to express relations tending to itself.” The only thing essential to these two cases is to denote the *apposition* or *junction of one object with another*; and this they do nearly, if not altogether, in the same manner, although from the custom of language they may not be indifferently subjoined to the same verb.

The *Greek* language has no *ablative case*; but in the *Latin*, where it is used, it denotes *concomitancy*, or that one thing accompanies another. From this *concomitancy* we sometimes draw an inference, and sometimes not. For example, when it is said, *Templum clamore petebant*, *clamour* is represented as *concomitant* with their going to the temple; and here no inference is drawn: but from the phrase *palleo metu*, although nothing more is expressed than that *palefulness* is a *concomitant* of the fear, yet we instantly infer that it is also the effect of it. In most instances where the *ablative* is used, an inference is drawn, of which the foundation is some *natural connection* observed to subsist between the objects thus connected in language. When this inference is not meant to be drawn, the preposition is commonly added: as, *interfectus est cum gladio*, “he was slain with a sword about him;” *interfectus est gladio*, “he was slain with a sword as the instrument of his death.”

20
Of the ab-
lative case.

The remaining cases, which have not been noticed, are the *nominative* and the *vocative*. These are in most instances alike in termination, which makes it probable that

minative
and voca-
tive cases.

F

(c) The *Greek* grammarians seem to have been aware of the nature of this case when they called it *πρωσις γενική*, or the *general case*: of which name the *Latin* grammarians evidently mistook the meaning when they translated it *casus genitivus*, or the *generative case*; a name totally foreign from its nature.

that they were originally *one* and the *same* case. The foundation of this conjecture will appear from considering the *use* to which each of these cases is applied. The *nominative* is employed to call up the idea of *any object* in the mind of the hearer. But when a man hears his *own name* mentioned, his attention is instantly roused, and he is naturally led to *listen to what is to be said*. Hence, when a man meant particularly to *solicit* one's attention, he would naturally pronounce that person's *name*; and thus the *nominative* case would pass into a *vocative*, of which the use is *always* to *solicit attention* (D).

12
The import
of the Greek
and Latin
cases, com-
monly ex-
pressed in
English by
preposi-
tions.

23
One case
in English
to denote
possession.

20. The *Greek* and *Latin* among the *ancient*, and the *German* among the *modern* languages, express different connections or relations of one thing with another by *cases*. In *English* this is done for the most part by prepositions; but the *English*, being derived from the same origin as the *German*, that is, from the *Teutonic*, has at least *one* variation of the substantive to answer the same purpose. For instance, the relation of *possession*, or *belonging*, is often expressed by a different ending of the substantive, which may be well called a *case*. This case answers nearly to the *genitive case* in *Latin*; but as *that* is not a denomination significant of the *nature* of the case in any language, it may perhaps in *English* be more properly called the *possessive case*. Thus, *God's grace*, anciently *Godis grace*, is the grace *belonging to* or in the *possession of* *God*: and may be likewise expressed by means of the preposition; thus,—*the grace of God*.

Although the word *Godis* is as evidently an inflexion of the noun *God* as the word *Dei* is an inflexion of *Deus*, there are grammarians who have denied that in *English* there is *any* true inflexion of the original noun, and who have said that the noun with the addition of that syllable, which we consider as the *sign of a case*, ceases to be a *noun*, and becomes a *definitive*; a word which with them is devoid of signification. Thus, in the expression *Alexander's house*, the word *Alexander's* stands not as a *noun*, but as an *article* or *definitive*, serving to ascertain and point out the *individuality* of the house. But this is a palpable mistake: the word *Alexander's* serves *not* to point out the *individuality* of the house, but to show to whom the house *belongs*; and is therefore, beyond dispute, not an *article*, but a *noun* in the *possessive case*. Again, when we say *St Peter's* at *Rome* and *St Paul's* at *London*, the words *St Peter's* and *St Paul's* are neither *articles*, nor, as has been absurdly imagined, the proper names of edifices, like the *Rotundo* or the *Circus*; but they are, in the *possessive case*, the names of the two apostles to whom the churches were *dedicated*, and to whom they are supposed to *belong*.

But that this, which we have called the *possessive case*, is really *not so*, must be evident, it is said, because there are certain circumstances in which it cannot be substituted for the noun with the preposition prefixed. Thus, though a man may say, I speak *of Alexander*, I write *of Caesar*, I think *of Pompey*; he cannot say, I speak *Alexander's*, I write *Caesar's*, or I think *Pompey's*. This

is indeed true, but it is nothing to the purpose: for though I may say, *Loquor de Alexandro, Scribo de Cesare, Cogito de Pompeio*; I cannot say, *Loquor Alexandri, Scribo Caesaris, or Cogito Pompeii*: and therefore all that can be inferred from this argument is, that as the *Latin genitive* is not always of the same import with the preposition *de*, so the *English possessive* is not *always* of the same import with the preposition *of*. Upon the whole, then, we may conclude, that *English nouns* admit of one inflexion; and that though *cases* are not so essential to nouns as gender and number, no language can be wholly without them or their various powers.

CHAPTER II.

Of ARTICLES or DEFINITIVES.

21. THE intention of language is to communicate thought, or to express those ideas which are suggested to us by our senses external and internal. The ideas first suggested to us are those of pain and pleasure, and of the objects with which we are surrounded; and therefore the words first learned must be *nouns*, or the names of objects natural, artificial, and abstract. Every object about which the human mind can be conversant is strictly and properly speaking *particular*; for all things in nature differ from one another in numberless respects, which, not to mention the idea of separate existence, so circumstance and *individuate* them, that no one thing can be said to be another. Now the use of language being to express our ideas or conceptions of these objects, it might naturally be expected that every object should be distinguished by a *proper name*. This would indeed be agreeable to the truth of things, but we have already seen that it is altogether impracticable. Objects have therefore been classed into *genera* and *species*; and names given, *not* to each *individual*, but to each *genus* and *species*. By this contrivance of language, we are enabled to ascertain in some measure any *individual* that may occur, and of which we know not the proper name, only by referring it to the *genus* or *species* to which it belongs, and calling it by the *general* or *specific* name; but as there is frequent occasion to distinguish individuals of the same species from one another, it became necessary to fall upon some expedient to mark this distinction. In many languages *general* and *specific* terms are modified and restricted by three orders of words; the *ARTICLE*, the *ADJECTIVE*, and the *OBLIQUE CASES* of *NOUNS*. The *cases* of *nouns* we have already considered: the *adjective* will employ our attention afterwards: at present our observations are confined to the *ARTICLE*; a word so very necessary, that without it or some equivalent invention men could not employ *nouns* to any of the purposes of life, or indeed communicate their thoughts at all. As the business of *articles* is to enable us, upon occasion, to employ *general terms* to denote *particular objects*, they must be considered, in combination with the general terms, as merely *substitutes* for proper names. They have, however, been commonly called *definitives*; because they serve

24
The necessity and use of the article.

(D) The chief objection to this conjecture, that the *nominative* and *vocative* were originally the *same case*, is taken from the *Latin* tongue, in which the nouns of the second declension ending in *us* terminate their *vocative* in *e*. But this is easily accounted for. The *s* in such words was often dropt, as appears from the scanning of old *Latin* poetry; and when this was done, the *u* being short, would naturally in pronunciation pass into *e*, a like short vowel; and thus, in the *vocative case*, *e* would in time be written instead of *u*.

serve to *define and ascertain any particular object, so as to distinguish it from the other objects of the general class to which it belongs, and, of course, to denote its individuality.* Of words framed for this purpose, whether they have by grammarians been termed *articles* or not, we know of no language that is wholly destitute. The nature of them may be explained as follows.

22. An object occurs with which, as an *individual*, we are totally unacquainted; it has a head and limbs, and appears to possess the powers of self-motion and sensation: we therefore refer it to its proper *species*, and call it *a dog, a horse, a lion*, or the like. If it belongs to none of the species with which we are acquainted, it cannot be called by any of their names; we then refer it to the *genus*, and call it *an animal*.

But this is not enough. The object at which we are looking, and which we want to distinguish, is not a *species* or a *genus*, but an *individual*. Of what kind? *Known or unknown?* Seen now for the first time, or seen before and now remembered? This is one of the instances in which we shall discover the use of the two articles *A* and *THE*: for, in the case supposed, the article *A* respects our *primary* perception, and denotes an individual as *unknown*; whereas *THE* respects our *secondary* perception, and denotes individuals as *known*. To explain this by an example: I see an object pass by which I never saw till now: What do I say? *There goes a beggar with a long beard.* The man departs, and returns a week after: What do I then say? *There goes the beggar with the long beard.* Here the article only is changed, the rest remains unaltered. Yet mark the force of this apparently minute change. The individual *once vague* is now recognised as *something known*; and that merely by the efficacy of this latter article, which tacitly insinuates a kind of *previous* acquaintance, by referring a present perception to a like perception already past.

This is the explanation of the articles *A* and *THE* as given by the learned Mr Harris, and thus far what he says on the subject is certainly just; but it is not true that the article *THE* *always* insinuates a *previous* acquaintance, or refers a present perception to a like perception already past.—I am in a room crowded with company, of which the greater part is to me totally unknown. I feel it difficult to breathe from the grossness of the inclosed atmosphere; and looking towards the window, I see in it a person whom I never saw before. I instantly send my compliments to *the gentleman in the window*, and request, that, if it be not inconvenient, he will have the goodness to let into the room a little fresh air. Of this gentleman I have no *previous* acquaintance; my present perception of him is my *primary* perception, and yet it would have been extremely improper to send my compliments, &c. to *a gentleman in the window*.—Again, there would be no impropriety in saying—“*A man* whom I saw yesterday exhibiting a show to the rabble, was this morning committed to jail charged with the crime of housebreaking.” Notwithstanding the authority, therefore, of Mr Harris and his master Apollonius, we may venture to affirm, that it is not *essential* to the article *A* to respect a *primary* perception, or to the article *THE* to indicate a *pre-established* acquaintance. Such may indeed be the manner in which these words are most frequently used; but we see that there are instances in which they may be used

differently. What then, it may be asked, is the import of each article, and in what respects do they differ?

23. We answer, that the articles *A* and *THE* are both of them *definitives*, as by being prefixed to the names of *genera* and *species* they so circumscribe the latitude of those names as to make them for the most part denote *individuals*. A *noun* or *substantive*, without any article to limit it, is taken in its widest sense. Thus, the word *man* means all mankind;

“The proper study of mankind is man:”

where *mankind* and *man* may change places without making any alteration in the sense. But let either of the articles of which we are treating be prefixed to the word *man*, and that word is immediately reduced from the name of a *whole genus* to denote only a *single individual*; and instead of the noble truth which this line asserts, the poet will be made to say, that the proper study of mankind is not the common nature which is diffused through the whole human race, but the manners and caprice of *one individual*. Thus far therefore the two articles agree: but they differ in this, that though they *both* limit the specific name to *some individual*, the article *A* leaves the *individual itself unascertained*; whereas the article *THE* *ascertains the individual also*, and can be prefixed to the specific name only when an individual is intended, of which something may be predicated that distinguishes it from the other individuals of the species. Thus, if I say—*A man is fit for treasons*, my assertion may appear strange and vague; but the sentence is complete, and wants nothing to make it intelligible: but if I say—*THE man is fit for treasons*, I speak nonsense; for as the article *THE* shows that I mean *some particular man*, it will be impossible to discover my meaning till I complete the sentence, and predicate something of the individual intended to distinguish him from other individuals.

“The man that bath not music in himself, &c.

“Is fit for treasons.”

A man, therefore, means some one or other of the human race *indefinitely*; *THE man* means, *definitely*, that *particular man* who is spoken of: the former is called the *indefinite*, the latter the *definite*, article.

The two articles differ likewise in this respect, that as the article *A* serves only to separate *one individual* object from the general class to which it belongs, it cannot be applied to *plurals*. It has indeed the same signification nearly with the numerical word *one*; and in French and Italian, the same word that denotes unity is also the article of which we now treat. But the essence of the article *THE* being to define objects, by pointing them out as those of which something is affirmed or denied which is not affirmed or denied of the other objects of the same class, it is equally applicable to *both* numbers; for things may be predicated of one *set of men*, as well as of a *single man*, which cannot be predicated of *other men*. The use and import of each article will appear from the following example: “*Man* was made for society, and ought to extend his goodwill to *all men*; but *a man* will naturally entertain a more particular regard for *the men* with whom he has the most frequent intercourse, and enter into a still closer union with *the man* whose temper and disposition suit best with his own.”

We have said, that the article *A* cannot be applied

to plurals, because it denotes unity: but to this rule there is apparently a remarkable exception in the use of the adjectives *few* and *many* (the latter chiefly with the word *great* before it), which, though joined with plural substantives, yet admit of the singular article *A*; as, *a few men, a great many men*. The reason of this is manifest from the effect which the article has in these phrases: it means a small or a great number collectively taken, to which it gives the idea of a whole, that is, of unity. Thus likewise *a hundred, a thousand*, is one whole number, an aggregate of many collectively taken, and therefore still retains the article *A* though joined as an adjective to a plural substantive; as, *a hundred years*. The exception therefore is only apparent; and we may affirm, that the article *A* universally denotes unity.

24. The indefinite article is much less useful than the other; and therefore the Greek and Hebrew languages have it not, though they both have a definite article. In languages of which the nouns, adjectives, and verbs, have inflexion, no mistake can arise from the want of the indefinite article; because it can always be known by the terminations of the noun and the verb, and by the circumstances predicated of the noun, whether a whole species or one individual be intended. But this is not the case in English. In that language, the adjectives having no variation with respect to gender or number, and the tenses of the verbs being for the most part the same in both numbers, it might be often doubtful, had we not the indefinite article, whether the specific name was intended to express the whole species or only one individual. Thus, if we say in English, "*Man was born sent from God*," we must be understood to mean that the birth of every man is from God, because to the specific term the indefinite article is not prefixed. Yet the words *Εγενετο ανθρωπος απισταλμενος παρα Θεου* convey no such meaning to any person acquainted with the Greek language; as the word *ανθρωπος*, without any article, is restricted to an individual by its concord with the verb and the participle; and the sense of the passage is, *A man was born (or existed) sent from God*. But though the Greeks have no article correspondent to the article *A*, yet nothing can be more nearly related than their *Ο* to our *THE*. *Ο βασιλευς*—*THE king*; *Το δωρον*—*THE gift*. In one respect, indeed, the Greek and English articles differ. The former is varied according to the gender and number of the noun with which it is associated, being *ο*—*masculine*, *η*—*feminine*, *το*—*neuter*; and *οι, αι, τα*, in the plural number: whereas the English article suffers no change, being invariably *THE* before nouns of every gender and in both numbers. There are, however, some modern languages which, in imitation of the Greek, admit of a variation of their article which relates to gender; but this cannot be considered as essential to this species of words, and it may be questioned whether it be any improvement to the language. In tongues of which the nouns have no inflexion, it can only serve to perplex and confuse, as it always presents a particular idea of sex where in many cases it is not necessary.

27
A greater number of articles in the English language than is commonly supposed.

25. The articles already mentioned are allowed to be strictly and properly such by every grammarian; but there are some words, such as *this, that, any, some, all, other, &c.* which are generally said to be sometimes articles and sometimes pronouns, according to the

different modes of using them. That words should change their nature in this manner, so as to belong sometimes to one part of speech, and sometimes to another, must to every unprejudiced person appear very extraordinary; and if it were a fact, language would be a thing so equivocal, that all inquiries into its nature upon principles of science and reason would be vain. But we cannot perceive any such fluctuation in any word whatever; though we know it to be a general charge brought against words of almost every denomination, of which we have already seen one instance in the possessive case of nouns, and shall now see another in those words which are commonly called pronominal articles.

If it be true, as we acknowledge it to be, that the genuine PRONOUN always stands by itself, assuming the power of a noun, and supplying its place, then is it certain that the words *this, that, any, some, &c.* can never be PRONOUNS. We are indeed told, that when we say *THIS is virtue, give me THAT*, the words *this* and *that* are pronouns; but that when we say, *THIS HABIT is virtue, THAT MAN defrauded me*, then are they articles or definitives. This, however, is evidently a mistake occasioned by overlooking those abbreviations in construction which are frequent in every language, and which, on account of that very frequency, have perhaps escaped the attention of grammarians whose sagacity has been successfully employed on matters less obvious.—When we say *THIS is virtue*, it is evident that we communicate no intelligence till we add a substantive to the word *this*, and declare what is virtue. The word *this* can therefore in no instance assume the power of a noun, since the noun to which it relates, though for the sake of dispatch it may be omitted in writing or conversation, must always be supplied by the mind of the reader or hearer, to make the sentence intelligible, or *this* itself of any importance.—“When we have viewed speech analysed, we may then consider it as compounded. And here, in the first place, we may contemplate that *synthesis*, which by combining simple terms produces a truth; then by combining two truths produces a third; and thus others and others in continued demonstration, till we are led, as by a road, into the regions of science. Now *THIS* is that superior and most excellent synthesis which alone applies itself to our intellect or reason, and which to conduct according to rule constitutes the art of logic. After *THIS* we may turn to those inferior compositions which are productive of the pathetic,” &c.—Here, if any where, the word *THIS* may be thought to stand by itself, and to assume the power of a noun; but let any man complete the construction of each sentence, and he will perceive that *THIS* is no more than a definite article. Thus,—“we may contemplate that synthesis which by combining simple terms produces a truth; then by combining two truths produces a third truth; and thus other truths and other truths in continued demonstration, till we are led, as by a road, into the regions of science. Now *THIS combination of truths* is that superior and most excellent synthesis which alone applies itself to our intellect or reason, and which to conduct according to rule constitutes the art of logic. After we have contemplated *THIS art*, we may turn,” &c.

The word *THAT* is generally considered as still more equivocal than *this*; for it is said to be sometimes an article,

article, sometimes a *pronoun*, and sometimes a *conjunction*. In the following extract it appears in all these capacities; and yet, upon resolving the passage into parts and completing the construction, it will be found to be invariably a *definite article*.—"It is necessary to *that* perfection, of which our present state is capable, *that* the mind and body should both be kept in action; *that* neither the faculties of the one nor of the other be suffered to grow lax or torpid for want of use: but neither should health be purchased by voluntary submission to ignorance, nor should knowledge be cultivated at the expence of health; for *that* must enable it either to give pleasure to its possessor, or assistance to others." If this long sentence be resolved into its constituent parts, and the words be supplied which complete the construction, we shall see the import of the word *THAT* to be precisely the same in each clause. "The mind and body should both be kept in action; *THAT* action is necessary to *THAT* perfection of which our present state is capable: neither the faculties of the one nor of the other should be suffered to grow lax or torpid for want of use; *the degree of action proper to prevent THAT laxness* is necessary: but neither should health be purchased by voluntary submission to ignorance, nor should knowledge be cultivated at the expence of health; for *THAT health* must enable it either to give pleasure to its possessor, or assistance to others." Again:

"He that's unskilful will not toss a ball:"

"A man unskilful (he is *that*) will not toss a ball." Here the word *THAT*, though substituted for what is called the *relative pronoun* (E), still preserves unchanged its definitive import; and in every instance except where it may be used very improperly, it will be found to be neither more nor less than a *definite article*.

26. It appears then, that if the *essence* of an *article* be to *define* and *ascertain*, the words *this* and *that*, as well as *any*, *some*, *all*, &c. which are commonly called *pronominal articles*, are much more properly *articles* than any thing else, and as such should be considered in universal grammar. Thus when we say, *THIS picture I approve*, but *THAT I dislike*; what do we perform by the help of the words *THIS* and *THAT*, but bring down the common appellative to denote two individuals; the one as *the more near*, the other as *the more distant*? So when we say, *SOME men are virtuous*, but *ALL men are mortal*; what is the natural effect of this *ALL* and *SOME*, but to define that *universality* and *particularity* which would remain indefinite were we to take them away? The same is evident in such sentences as, *SOME substances have sensation*, *OTHERS want it*; *Choose ANY way of acting*, and *SOME men will find fault*, &c.: for here *SOME*, *OTHER*, and *ANY*, serve all of them to *define* different parts of a given whole; *SOME*, to denote any *indeterminate part*; *ANY*, to denote an *indefinite mode of acting*, no matter what; and *OTHER*, to denote the *remaining* part, when a part has been assumed already.

27. We have said that the *article* is a part of speech so very necessary, that without it, or some equivalent

invention (F), mankind could not communicate their thoughts; and that of words falling under this description, we know of no language which is wholly destitute. We are aware that these positions may be controverted; and that the *Latin* may be instanced as a language which, without *articles*, is not only capable of communicating the ordinary thoughts of the speaker to the mind of the hearer; but which, in the hands of *Cicero*, *Virgil*, and *Lucretius*, was made to serve all the purposes of the most profound philosopher, the most impassioned orator, and the sublimest poet. That the *Latin* has been made to serve all these purposes cannot be denied, although *Lucretius* and *Cicero* both complain, that on the subject of *philosophy*, where the use of articles is most conspicuous, it is a deficient language. But should we grant what cannot be demanded, that those two great men were unacquainted with the powers of their native tongue, our positions would still remain unshaken; for we deny that the *Latin* is wholly without articles. It has indeed no word of precisely the same import with our *THE* or the *Greek* *ὁ*; but the place of the indefinite article *A* might be always supplied, if necessary, with the numerical word *unus*. It may be so even in *English*; for we believe there is not a single instance where the words *one man*, *one horse*, *one virtue*, might not be substituted for the words *a man*, *a horse*, *a virtue*, &c. without in the slightest degree altering the sense of the passage where such words occur. This substitution, however, can be but very seldom if ever necessary in the *Latin* tongue, of which the precision is much greater than that of the *English* would be without articles; because the oblique cases of the *Latin* nouns, and the inflexion of its verbs, will almost always enable the reader to determine whether an appellative represents a whole species or a single individual.—The want of the definite article *THE* seems to be a greater defect; yet there are few instances in which its place might not be supplied by *THIS* or by *THAT* without obscuring the sense; and the *Latin* tongue is by no means deficient of articles corresponding to these two. Let us substitute the words *ONE* and *THAT* for *A* and *THE* in some of the foregoing examples, and we shall find, though the sound may be uncouth, the sense will remain. Thus,

"*THAT* man who hath not music in himself, &c.

"Is fit for treasons,"—

conveys to the mind of the reader the very same sentiment which the poet expresses by the words "*THE* man that hath not music," &c. Again, "*Man* was made for society, and ought to extend his good-will to *all* men; but *one* man will naturally entertain a more particular regard for *those* men with whom he has the most frequent intercourse, and enter into a still closer union with *that* man whose temper and disposition suit best with his own." Now the words *HIC* and *ILLE* being exactly of the same import with the words *THIS* and *THAT*; it follows, that wherever the place of the article *THE* may in *English* be supplied by *THIS* or by *THAT*, it may in *Latin* be supplied by *HIC* or by *ILLE*. This

is

(E) See more of this afterwards.

(F) As in the Persian and other eastern languages, in which the place of our indefinite article is supplied by a termination to those nouns which are meant to be particularized.

is the case with respect to NATHAN's reproof of DAVID, where the definite article is indeed most emphatical. The original words might have been translated into English, "thou art *that* man," as well as "thou art *the* man;" and in *Latin* they may with the utmost propriety be rendered, "Tu es *ille* homo." Indeed the words HIC and ILLE, and we might instance many more, though they are commonly called *pronouns*, are in truth nothing but *definite articles*: HIC is evidently *hic*; and ILLE is most probably derived from the Hebrew word *al*, in the plural *ale*; which may be translated indifferently, either THE or THAT. But what proves beyond dispute that these two words are not *pronouns* but *articles*, is, that in no single instance will they be found to stand by themselves and assume the power of *nouns*. For the sake of dispatch, or to avoid disagreeable repetitions, the *noun* may indeed be often omitted; but it is *always supplied* by the reader or hearer, when HIC and ILLE appear in their proper place, and are seen to be invariably *definite articles*. We shall give an example of the use of each word, and dismiss the subject.

28
Hic and
Ille articles.

In the first oration against Catiline, Cicero begins with addressing himself in a very impassioned style to the traitor, who was present in the senate-house. He then exclaims pathetically against the manners of the age, and proceeds in these words: *Senatus hæc intelligit, consul videt: hic tamen vivit. Vivit? immo verè etiam in senatum venit: sit publici consilii particeps.* In this passage HIC cannot be a pronoun; for from the beginning of the oration there occurs not a single *noun* of which it can possibly supply the place. When the orator uttered it, he was probably pointing with his finger at Catiline, and every one of his audience would supply the *noun* in his own mind, as we do when we translate it, "Yet *this* traitor lives." When Virgil says,

ILLE ego, qui quondam gracili modulatus avena
Carmen,

it is obvious that he means, *I am THAT MAN, or THAT POET, who sung, &c.*; and though we may translate the words "I am *he* who tuned his song," &c. yet when we construe the passage, we are under the necessity of supplying either *vates* or *vir*, which shows that ILLE is nothing more than a definite article signifying THAT or THE. It appears then, that the *Latin* tongue is not wholly destitute of articles, as few cases can occur where the Greek *ὁ* and our THE may not be supplied by the words HIC and ILLE; which have in our opinion been very improperly termed *pronouns*. If there be any such cases, we can only confess that the *Latin* language is defective; whereas, had it *no* articles, it is not easy to conceive how it could answer, to a cultivated people, the ordinary purposes of speech.

28. The articles THIS and THAT, unlike A and THE, are varied according as the *noun*, with which they are associated, is in the singular or in the plural number. Thus we say—*this* and *that* man in the singular, and *these* and *those* men in the plural. The *Latin* articles *hic* and *ille*, for such we will call them, are varied like the Greek *ὁ*, not only with the number, but also with the gender of their *nouns*. In languages, where the structure of a sentence may be so changed from the order of nature, as it commonly is in Greek and *Latin*, and where the reader is guided, not by the *position*, but by the *terminations* of the words, to those which are in con-

cord and those which are not, these variations of the article have their use; but in English they are of no importance. Were it not that the custom of the language—the *forma loquendi*, as Horace calls it—has determined otherwise, there would be no more impropriety in saying *this* or *that* men, than in saying *some* men, or *the* men.

29. As articles are by their nature definitives, it follows of course, that they cannot be united with such words as are in their own nature *as definite as they may be*; nor with such words as, *being undefinable, cannot properly be made otherwise*; but only with those words which, though indefinite, are yet capable through the article of becoming definite. Hence the reason why it is absurd to say, THE I, or THE THOU; because nothing, as will be seen afterwards, can make these pronouns more definite than they are of themselves; and the same may be said of proper names. Neither can we say, THE BOTH, because the word BOTH is in its own nature perfectly defined. Thus, if it be said—"I have read both poets,"—this plainly indicates a definite pair, of whom some mention has been made already. On the contrary, if it be said, "I have read two poets," this may mean any pair out of all that ever existed. And hence this numeral being in this sense indefinite (as indeed are all others as well as itself), is forced to assume the article whenever it would become definite. Hence also it is, that as TWO, when taken alone, has reference to some primary and indefinite perception, while the article THE has reference to some perception secondary and definite, it is bad language to say, TWO THE MEN, as this would be blending of incompatibles, that is, it would be representing two men as defined and undefined at the same time. On the contrary, to say BOTH THE MEN, is good language; because the substantive cannot possibly be less apt by being defined, to coalesce with a numeral adjective which is defined as well as itself. So likewise it is correct to say, THE TWO MEN, THESE TWO MEN, OR THOSE TWO MEN; because here the article, being placed at the beginning, extends its power, as well through the numeral adjective as the substantive, and tends equally to define them both.

30. As some of the above words admit of no article, because they are by nature as definite as may be; so there are others which admit it not, because they are not to be defined at all. Of this sort are all INTERROGATIVES. If we question about substances, we cannot say, THE WHO IS THIS, but WHO IS THIS? And the same as to qualities and both quantities: for we say, without an article, WHAT SORT OF, HOW MANY, HOW GREAT? The reason is, the article THE respects beings of which we can predicate something: but interrogatives respect beings about which we are ignorant, and of which we can therefore predicate nothing; for as to what we know, interrogation is superfluous. In a word, the natural associates with articles are ALL THOSE COMMON APPELLATIVES WHICH DENOTE THE SEVERAL GENERA AND SPECIES OF BEINGS: and it may be questioned whether, in strictness of speech, they are ever associated with any other words.

31. We have said that proper names admit not of the article, being, in their own nature, definite. This is true, whilst each name is confined to one individual; but as different persons often go by the same name, it is necessary to distinguish these from one another, to prevent

29
With what
words ar-
ticles can-
not be uni-
ted.

30
With what
words they
naturally
associate.

prevent the ambiguity which this identity of name would otherwise occasion. For this purpose we are obliged to have recourse to *adjectives* or *epithets*. For example, there were two *Grecian chiefs* who bore the name of *Ajax*; and it was not without reason that *Mneſtheus* used *epithets* when his intention was to distinguish the one from the other: "If both *Ajaxes* cannot be spared (said he), at least let mighty *Telamonian Ajax* come." But as epithets are diffused through various subjects, in as much as the same adjective may be referred to many substantives, it has been said to be necessary, in order to render both parts of speech equally definite, that the adjective itself assume an article before it, which may indicate a reference to some single person only. It is thus we say—*Trypho the Grammarian*; *Apollodorus the Cyrenian*, &c. This is the doctrine of *Mr Harris*; from which, though we have the highest respect for the learning of the author, we feel ourselves obliged to dissent. In the examples given, the article *THE* is certainly not associated with the words *Grammarian* and *Cyrenian*, in the same manner in which it is associated with the word *man* in the sentence—"The man that hath not music in himself," &c. When we say *Apollodorus the Cyrenian*, we may, without folly or impertinence, be asked—the *Cyrenian*, *WHAT* (G)? And the moment this question is answered, it will be seen that the article defines, not an adjective, but a substantive. If the answer be, the *Cyrenian philosopher*, the article *THE* is associated with the word *philosopher*, and the phrase *Apollodorus the Cyrenian*, is an abbreviation of *Apollodorus the philosopher of Cyrene*. In like manner, *Trypho the grammarian*, is *Trypho the grammarian writer*, or *Trypho the writer of grammar*. Such abbreviations are very common. We familiarly say *THE SPEAKER*, and are understood to mean a high officer in the British parliament; yet as *speaker* is a name common to many men, we may, without impropriety, be asked, *what speaker* we mean? and if so, we must reply, *the speaker of the house of commons*. But that which is eminent is supposed to be generally known; and therefore, in common language, *THE SPEAKER* is deemed a sufficient designation of him who presides over the lower house of parliament. Hence, by an easy transition, the definite article, from denoting reference, comes to denote eminence also; that is to say, from implying an ordinary pre-acquaintance, to presume a kind of general and universal notoriety. Thus *A KING* is any king; but *THE KING* is that person whom we acknowledge for our sovereign, the *king of Great Britain*. In Greek too, as in English, the article is often a mark of eminence; for *THE POET* meant *Homer*, and *THE STAGYRITE* meant *Aristotle*; not but that there were many poets besides *Homer*, and many *Stagyrites* besides *Aristotle*, but none equally illustrious.

31 The great utility of this species of word.

32. Before we dismiss the *ARTICLE*, we shall produce one example to show the utility of this species of words; which, although they may seem to be of small importance, yet, when properly applied, serve to make a few general terms sufficient for expressing, with accuracy, all the various objects about which mankind can have occasion to converse. Let *MAN* be the general term, which I have occasion to employ for the purpose

of denoting some particular. Let it be required to express this particular as *unknown*; I say *A man*:—*Known*; I say *THE man*:—*Definite*; *A CERTAIN man*:—*Indefinite*; *ANY man*:—*Present, and near*; *THIS man*:—*Present, and at some distance*; *THAT man*:—*Like to some other*; *SUCH a man*:—*Different from some other*; *ANOTHER man*:—*An indefinite multitude*; *MANY men*:—*A definite multitude*; *A THOUSAND men*:—*The ones of a multitude, taken throughout*; *EVERY man*:—*The same ones taken with distinction*; *EACH MAN*:—*Taken in order*; *FIRST man*, *SECOND man*, &c.: *The whole multitude of particulars taken collectively*; *ALL men*:—*The negation of that multitude*; *NO man*:—*A number of particulars present and near*; *THESE men*:—*At some distance, or opposed to others*; *THOSE men*:—*A number of individuals separated from another number*; *OTHER men*:—*A small indefinite number*; *FEW men*:—*A proportionally greater number*; *MORE men*:—*A smaller number*; *FEWER men*:—And so on we might go almost to infinitude. But not to dwell longer upon this subject, we shall only remark, "that minute changes in *PRINCIPLES* lead to mighty changes in effects; so that *PRINCIPLES* are well intitled to regard, however trivial they may appear."

CHAPTER III.

Of PRONOUNS, or SUBSTANTIVES of the second order.

33. To men who are neither intoxicated with their own abilities, nor ambitious of the honour of building new systems, little pleasure can accrue from differing upon points of science from writers of great and deserved reputation. In such circumstances a man of modesty, although he will not upon the authority of a celebrated name adopt an opinion of which he perceives not the truth, must always advance his own notions with some degree of diffidence, as being conscious that the truth, which he cannot perceive, may be visible to a keener and more perspicacious eye. In these circumstances we feel ourselves with regard to some of the most celebrated writers on grammar, from whom, concerning one or two points, comparatively indeed of but little importance, we have already been compelled reluctantly to differ. In treating of pronouns we are likely to deviate still farther from the beaten track; but that we may not be accused of acting the part of dogmatists in literature, and of claiming from others that implicit confidence which we refuse to give, we shall state with fairness the commonly received opinions, point out in what respects we think them erroneous, assign our reasons for calling them in question, and leave our readers to judge for themselves. The most celebrated writer in English who has treated of pronouns, and whom, since the publication of his *Hermes*, most other writers have implicitly followed, is *Mr Harris*, who, after a short introduction, proceeds thus:

34. "All conversation passes between individuals who will often happen to be till that instant *unacquainted* with each other. What then is to be done? How shall the speaker address the other, when he knows not his name? or how explain himself by his own name, which the other is wholly ignorant? Nouns, as they have

32 The commonly supposed import of the personal pronouns.

have been described, cannot answer this purpose. The first expedient upon this occasion seems to have been pointing, or indication by the finger or hand; some traces of which are still to be observed, as a part of that action which naturally attends our speaking. But the authors of language were not content with this: they invented a race of words to supply this pointing; which words, as they always stood for substantives or nouns, were characterized by the name of PRONOUNS. These also they distinguished into three several sorts, calling them pronouns of the first, the second, and the third person, with a view to certain distinctions, which may be explained as follows.

“Suppose the parties conversing to be wholly unacquainted, neither name nor countenance on either side known, and the subject of the conversation to be the speaker himself. Here to supply the place of pointing, by a word of equal power, the inventors of language furnished the speaker with the pronoun I; I write, I say, I desire, &c.: and as the speaker is always principal with respect to his own discourse, this they called, for that reason, the pronoun of the first person.

“Again, suppose the subject of the conversation to be the party addressed. Here, for similar reasons, they invented the pronoun THOU; THOU writest, THOU walkest, &c.: and as the party addressed is next in dignity to the speaker, or at least comes next with reference to the discourse, this pronoun they therefore called the pronoun of the second person.

“Lastly, suppose the subject of conversation neither the speaker nor the party addressed, but some third object different from both. Here they provided another pronoun, HE, SHE, or IT; which, in distinction to the two former, was called the pronoun of the third person: And thus it was that pronouns came to be distinguished by their respective PERSONS.”

§ 6. The description of the different PERSONS here given is taken, we are told, from PRISCIAN, who took it from APOLLONIUS. But whatever be the deference due to these ancient masters, their learned pupil, though guided by them, seems not to have hit upon the true and distinguishing characteristic of the personal pronouns. He supposes, that when the names of two persons conversing together are known to each other, they may, by the use of these names, express all that the personal pronouns express: but this is certainly not true. To us, at least, there appears to be a very material difference between saying, “George did this,” and “I did this;” nor do we think that the power of the pronoun would be completely supplied by the name, even with the additional aid of indication by the hand. So when one man says to another, with whom he is conversing, “James did so and so;” it is surely not equivalent to his saying, “you did so and so.” If such were the case, one might pertinently ask, when both persons are known to each other, Why do they use the personal pronouns? Mr Harris tells us, that “when the subject of conversation is the speaker himself, he uses I; and when it is the party addressed, he uses THOU.” But in fact the nature of the personal pronouns has no sort of connection with the subject of conversation, whether that conversation relate to the speaker, the party addressed, or a Greek book. In this sentence, “I say that the three angles of every triangle are equal to two right angles,” the speaker is surely not the sub-

ject of the discourse: nor is the party addressed, but the truth of his assertion, the subject of discourse in the following sentence;—“You say, that Horne Tooke’s *Diversions of Purley* is the most masterly treatise on grammar, so far as it goes, that you have ever seen.” Mr Harris uses the phrase, becoming the subject of conversation, in no other sense than that when the speaker has occasion to mention HIMSELF, he uses I; when the party addressed, THOU; and when some other person or thing, HE, SHE, or IT: but we know that he may use other words, by no means equivalent to the two first of these pronouns, which will sufficiently mark himself, and the party addressed; and that he may use indifferently, and without the smallest injury to the sense, either the third pronoun, or the word for which it is merely a substitute. A man who bears various characters, may design HIMSELF by any one of them. Thus Mr PITT may speak of himself as first lord of the treasury, chancellor of the exchequer, or member for the university of Cambridge; and in each case he would be what Mr Harris calls the subject of conversation: yet every one feels that none of these designations is equivalent to I. What then is the force of the personal pronouns?

37. It appears to be simply this: The first denotes the speaker, AS CHARACTERIZED BY THE PRESENT ACT OF SPEAKING, in contradistinction to every other character which he may bear. The second denotes the party addressed, AS CHARACTERIZED BY THE PRESENT CIRCUMSTANCE OF BEING ADDRESSED, in contradistinction to every other character, &c.: And what is called the person of the third pronoun is merely a NEGATION OF THE OTHER TWO, as the neuter gender is a negation of the masculine and feminine. If this account of the personal pronouns be true, and we flatter ourselves that its truth will be obvious to every body, there is but one way of expressing by other words the force of the pronouns of the first and second person. Thus, “The person who now speaks to you did so and so,” is equivalent to “I did so and so;” and “The person to whom I now address myself did so and so,” is equivalent to “You did so and so.”

Hence we see why it is improper to say the I or the THOU; for each of these pronouns has of itself the force of a noun with the definite article prefixed, and denotes a person of whom something is predicated, which distinguishes him from all other persons. I is the person who now speaks, THOU is the person who is now addressed by the speaker. Hence too we see the reason why the pronoun I is said to be of the first, and the pronoun THOU of the second person. These pronouns can have place only in conversation, or when a man, in the character of a public speaker, addresses himself to an audience; but it is obvious, that there must be a speaker before there can be a hearer; and therefore, that the pronouns may follow the order of nature, I, which denotes the person of the speaker, must take place of THOU, which denotes the person of the hearer. Now the speaker and the hearer being the only persons engaged in conversation or declamation, I is with great propriety called the pronoun of the first, and THOU the pronoun of the second person. We have said, that, with respect to pronouns, the third person, as it is called, is merely a negation of the other two. This is evident from the slightest attention to the import of those words which are called pronouns of the third person. HE, SHE, or IT, denotes not the person either of the speaker or of the hearer; and,

and, as we have just observed, no other person can have a share in conversation or declamation. An absent person or an absent thing may be the *subject* of conversation, but cannot be the *speaker* or the *person addressed*. HE, SHE, and IT, however, as they *stand by themselves*, and assume the *power of nouns*, are very properly denominated *pronouns*; but they are not *personal* pronouns in any other sense than as the *negation of sex* is the *neuter gender*.

38. We have already seen that nouns admit of number; *pronouns*, which are their substitutes, likewise admit of number. There may be MANY speakers at once of the *same* sentiment, as well as *one*, who, including himself, speaks the sentiment of MANY: speech may likewise be addressed to MANY at a time, as well as to ONE; and the subject of the discourse may likewise be MANY. The pronoun, therefore, of every one of the *persons* must admit of number to express this *singularity* or *plurality*. Hence the pronoun of the first person I, has the plural WE; that of the second person THOU has the plural YE or YOU; and that of the third person HE, SHE, or IT, has the plural THEY, which is equally applied to all the three genders.

34
The second
personal
pronoun
used in the
plural num-
ber when
only one
person is
addressed.

The Greeks and Romans, when addressing *one* person, used the pronoun in the singular number THOU; whereas, in the polite and even in the familiar style, we, and many other modern nations, use the plural YOU. Although in this case we apply YOU to a *single* person, yet the *verb* must agree with it in the *plural number*; it must necessarily be, *you have*, not *you hast*. YOU WAS—the *second person plural* of the *pronoun* placed in agreement with the *first* or *third person singular* of the *verb*, is an enormous, though common, solecism, which ought to be carefully avoided. In very solemn style, as when we address the supreme Being, we use THOU—perhaps to indicate that *he is God alone*, and that *there is none like unto him*; and we sometimes use the same form of the pronoun in contemptuous or very familiar language, to intimate that the person to whom we speak is the *meanest* of human beings, or the *dearest* and *most familiar* of our friends. A king, exerting his authority on a solemn occasion, adopts the *plural* of the first person, “WE strictly command and charge;” meaning, that he acts by the advice of counsellors, or rather as the representative of a whole people. But in *all cases* in which the *use of the pronoun* deviates from the *nature of things*, the *verb in concord* deviates with it; for, as will be seen afterwards, these two words universally agree in number and person.

35
The pro-
nouns of
the first and
second per-
sons have
no varia-
tions to de-
note sex,
and why.

39. But though all these pronouns have *number*, neither in *Greek*, *Latin*, or any modern language, do those of the *first* and *second* person carry the distinctions of sex. The reason is obvious (H), namely, that *few* and

VOL. VIII. Part I.

all other properties and attributes whatever, except those mentioned above as *descriptive* of the *nature* of these pronouns, are foreign from the intention of the speaker, who, when he uses the pronoun I, means THE PERSON WHO NOW SPEAKS,—no matter whether man or woman: and when the pronoun THOU—THE PERSON—no matter whether man or woman—TO WHOM HE NOW ADDRESSES HIMSELF—and nothing more. In this re-
But the pronoun of the third person denoting neither *speaker* nor the *hearer*, but the *subject* of the dis-
course, and being merely the substitute of a *noun* which may be either *masculine*, *feminine*, or *neuter*, must of ne-
cessity agree with the noun which it represents, and admit of a triple distinction significant of gender. In
English, which allows its adjectives no genders, this pronoun is HE in the *masculine*, SHE in the *feminine*, and IT in the *neuter*; the utility of which distinction may be better found in supposing it away. Suppose, for example, that we should in history read these words: *He caused him to destroy him*—and were informed that the pronoun, which is here thrice repeated, stood each time for something different; that is to say, for a man, for a woman, and for a city, whose names were *Alexander*, *Thais*, and *Persepolis*. Taking the pronoun in this manner—divested of its gender—how would it appear which was destroyed, which the destroyer, and which the cause that moved to the destruction? But there is no ambiguity when we hear the genders distinguished: when we are told, with the proper distinctions, that SHE caused HIM to destroy IT, we know with certainty, that the *promoter* was the *woman*; that her *instrument* was the *hero*; and that the *subject* of their cruelty was the *unfortunate city*.—From this example we would be surprised how the *Italians*, *French*, and *Spaniards*, could express themselves with precision or elegance with no more than two variations of this pronoun.

40. Although, in every language with which we are acquainted, there is but one pronoun for each of the first and second persons; and although it is obvious from the nature and import of those words, that no more can be necessary; yet the mere *English* reader may perhaps be puzzled with finding three distinct words applied to each; I, MINE, and ME, for the first person; THOU, THINE, and THEE, for the second. The learned reader will see at once that the words MINE and ME, THINE and THEE, are equivalent to the *genitive* and *accusative cases* of the Latin pronouns of the first and second persons. That MINE is a pronoun in the possessive case, is obvious; for if I were asked “whose book is that before me?” I should reply—“It is MINE (I);” meaning that it belongs to me.

the third
person
differs from
the first and
second.

37
The cases
of pro-
nouns.

(H) The reason assigned by Mr Harris and his followers, is, that “the speaker and hearer being generally present to each other, it would have been superfluous to have marked a distinction by art, which from nature and even dress was commonly apparent on both sides.” This is perhaps the best reason which their description of the personal pronouns admits, but it is not satisfactory; for the speaker and hearer may meet in the dark, when different dresses cannot be distinguished.

(I) If we mistake not, Dr Johnson has somewhere affected to ridicule Bishop Lowth for considering the word MINE as the *possessive case* of the *pronoun* of the first person. According to the Doctor, MINE is the same word with the pronominal adjective MY; and was anciently used before a vowel, as MY was before a consonant. This is not said with the great Lexicographer’s usual precision. That MINE was anciently used before a vowel is certain; but it does not therefore follow, that it is the same word with MY. If it were, we might on every occasion

That the word *ME* is the *same* pronoun in the *case* which the Latin grammarians call the *accusative*, is evident from the import of that word in the sentence *HE ADMIRES ME*, where the *admiration* is supposed to proceed from (κ) the *person spoken of* to the *person who speaks*. It appears therefore, that though English nouns have only *two cases*, the *nominative* and *possessive*, the *pronouns* of that language have three, as *I, MINE, ME*; *THOU, THINE, THEE*; *HE, HIS, HIM, &c.* That these are *cases*, can be questioned by no man who admits that *mei, mihi, me*, are *cases* of the Latin pronoun *EGO*. Both pronouns, the *Latin* and the *English*, are irregularly inflected: and perhaps those words which are called the *oblique cases* of each may have originally been derived from *nominatives* different from *EGO* and *I*; but these *nominatives* are now lost, and *mei* and *mine* have, beyond all dispute, the effect of the *genitives* of the *Latin* and *English* pronouns of the first person. These variations, however, cannot be looked upon as an essential part of language, but only as a particular refinement invented to prevent the disagreeable repetition of the pronoun, which must frequently have happened without such a contrivance. This seems to have been the only reason why *pronouns* have been endowed with a greater variety of *cases* than *nouns*. *Nouns* are in themselves greatly diversified. Every *genus* and every *species* of objects has a distinct name, and therefore the sameness of sound does not so often occur among them as it would among the *pronouns*, without *cases*, where the same *I, THOU, HE, SHE, or IT*, answers for every object which occurs in nature: but by this diversity in the form of the words, the *cacophonia*, which would be otherwise disgusting, is in a great measure avoided. It is, probably, for the same reason, that the *plural* of each of these pronouns is so very different from the *singular*. Thus from *I, MINE, ME*, in the *singular*, is formed, in the *plural*, *WE, OURS, US*; from *THOU, THINE, and THEE, YE or YOU, YOURS, YOU*; and from *HE, SHE, IT, HIS, HERS, ITS, HIM, HER, IT*, in the *singular*, *THEY, THEIRS, THEM*, in the *plural*. In all of which there is not the least resemblance between the *singular* and *plural* of any one word: and except in *HE, HIS, HIM*; *IT, ITS*; *THEY, THEIRS, THEM*; there is not any similarity between the different *cases* of the same word in the same number.

38
The first
and second
personal
pronouns
coalesce
with the
third.

41. From the account here given of the personal pronouns, it appears that the first or second will, either of them, coalesce with the third, but not with each other. For example, it is good sense, as well as good grammar, to say in any language, *I AM HE—THOU ART HE—WE WERE THEY—YOU WERE THEY*; but we cannot say—*I AM THOU—NOR THOU ART I—NOR WE ARE YOU, &c.* The reason is, there is no absurdity for the *speaker* to be the *subject* also of the discourse, as when it is said—*I am he*; or for the *person addressed*, as when we say, *thou art he*. But for the same person, in the same circumstances, to be at once the *speaker* and the party addressed, is impossible; for which reason the

coalescence of the pronouns of the first and second persons is likewise impossible.

42. *I, THOU, HE, SHE, and IT*, are all that are usually called *personal pronouns*. There is another class of words, which are called sometimes *pronominal adjectives*, sometimes *adjective pronouns*, sometimes *possessive pronouns*; and by one writer of grammar they have been most absurdly termed *pronominal articles*. It is not worth while to dispute about a name; but the words in question are *MY, THY, HER, OUR, YOUR, THEIR*. These words are evidently in the form of *adjectives*: for, like other English adjectives, they have no variation to indicate either *gender, number, or case*; and yet they are put in *concord* with *nouns* of every gender and both numbers, as *MY WIFE, MY SON, MY BOOK—HER HUSBAND, HER SONS, HER DAUGHTERS, &c.* But, though in the form of *adjectives*, they have the power of the *personal pronouns* in the *possessive case*: *MY BOOK is the book of ME, or the book of HIM WHO NOW SPEAKS*; *OUR HOUSE is the house of US, or the house occupied by the PERSONS WHO NOW SPEAK*; *HER HUSBAND, is the husband of a woman who can be known only from something preceding in the discourse*; and *THEIR PROPERTY is the property of them—of any persons, whether men or women, or both, who have been previously mentioned*. Words which have the form of *adjectives*, with the power of *pronouns*, may, without impropriety, be called *pronominal adjectives*; and such is the name by which we shall henceforth distinguish them. To these *pronominal adjectives*, as well as to the *personal pronouns*, are subjoined the words *own* and *self*—in the *plural selves*; in which case they are emphatical, and imply a silent contrariety or opposition. Thus, *I live in my own house*; that is, *not in a hired house*. *This I did with my own hand*; that is, *not by proxy*. *This was done by myself*; that is, *not by another*. The word *self* subjoined to a *personal pronoun* forms also the *reciprocal pronoun*; as, *we hurt ourselves by vain rage*; *he blamed himself for his misfortune*. *Himself, itself, themselves*, are supposed by Wallis to be put, by corruption, for *his self, its self, their selves*; so that *self* is always a *substantive* or *noun*, and not a *pronoun*. This seems to be a just observation: for we say, *the man came himself*; *they went themselves*; where the words *himself* and *themselves* cannot be *accusatives* but *nominatives*, and were anciently written *his self, their selves*.

40
The reci-
procal pro-
noun.

There are other words which are usually ranked under the class of *pronouns*; as *who, which, what*. These, when employed in asking questions, are called *interrogative pronouns*; though a name more characteristic might surely be found for them. Their import, however, will be more easily ascertained after we have considered another species of pronouns, which have been denominated *relatives*, and with which they are intimately connected.

43. The pronouns already mentioned may be called *prepositive*, as may indeed all *substantives*, because they are capable of introducing or leading a sentence: noun. but

41
The rela-
tive pro-
noun.

occasion substitute either of these for the other, without offending against grammar, however we might injure the sound; but we apprehend that this is not the case. "That book is *MINE*," is good English; but "that book is *my*," would be a gross solecism: the reason is, that *MINE* is a *genuine pronoun*, and stands by *itself* with the power of a *noun*; but *MY*, being an *adjective*, cannot stand by *itself*.

(κ) See Chap. I. 18, 19. on the Cases of Nouns.

but there is another pronoun which has a character peculiar to itself; and which, as it is never employed but to connect sentences, and must therefore have always a reference to something preceding, is called the *subjunctive* or *relative* pronoun. This pronoun is in Greek, *ὅς, ὃς, ὅ;* in *Latin*, *QUI, QUÆ, QUOD;* and in *English*, *WHO, WHICH, THAT.*

42 Represents any noun, or prepositive pronoun; 44 Of the same import with the English preposition of.

44. In order to determine with precision the nature and import of the *relative pronoun*, it will be necessary to ascertain the powers which it contains, or the parts of speech into which it is capable of being resolved. Now, it is obvious, that there is not a single noun, or *prepositive pronoun*, which the *relative* is not capable of representing: for we say, *I, WHO saw him yesterday, cannot be mistaken;* *YOU, WHO did not see him, may have been misinformed;* *THEY, WHO neither saw nor heard, can know nothing of the matter;* *THE THINGS, WHICH he exhibited, were wonderful.* From these examples it is apparent, in the first place, that the *relative* contains in itself the force of any other pronoun; but it contains something more.

43 And contains besides the force of a connective.

45. If from any sentence in which there is a *relative*, that *relative* be taken away, and the *prepositive* pronoun, which it represents, be substituted in its stead, the sentence will lose its bond of union, and stand quite loose and unconnected. Thus, if instead of saying *the man is wise WHO speaks little*, we should say *the man is wise HE speaks little*, the sentence would be resolved into two; and what is affirmed of the man's wisdom, would have no connection with the circumstance of his speaking little. Hence it is evident, in the second place, that the *relative* contains the force of a *connective* as well as of the *prepositive* pronoun. What kind of connection it denotes, is next to be ascertained.

46. It may be laid down as a general principle, "that, by means of the *relative pronoun*, a *clause of a sentence*, in which there is a verb, is converted into the nature of an *adjective*, and made to denote some attribute of a substance, or some property or circumstance belonging to the antecedent noun." Thus, when it is said, *homo qui prudentia præditus est*, the relative clause—*qui prudentia præditus est*, expresses nothing more than the quality of prudence in concrete with the subject *homo*, which might have been equally well expressed by the adjective *prudens*. In like manner, when we say, *vir sapit qui pauca loquitur*, the relative clause expresses the property of speaking little as belonging to the man, and as being that quality which constitutes, or from which we in-

fer, his wisdom; but if there were such a word as *pauciloquens*, that quality might very properly be expressed by it, and the phrase *vir sapit pauciloquens* would express the same assertion with *vir sapit qui pauca loquitur*.

Now if a relative clause expresses that which might be expressed by an adjective, the presumption is, that it may be resolved into the same constituent parts. But every adjective contains the powers of an *abstract substantive*, together with an expression of connection; and may be resolved into the *genitive case* of that substantive, or into the *nominative* with the particle *of* prefixed, which, in English, corresponds to the termination of the genitive in the ancient languages. That the member of a sentence, in which there is a relative, may, in every instance, be analysed in the same manner, will be apparent from the following examples.

Vir qui sapit, vir sapiens, and vir sapientia; "a man who is wise, a wise man, and a man of wisdom;" are certainly phrases of the same import. Again, *homo, cui ingratus est animus, malus fit amicus*, may be translated into Greek, *ἀνθρώπος ἀκαριστίας κακός γίνεσθαι φίλος;* and into English, "the man of ingratitude is a bad friend."

47. Thus then it appears, that the *relative pronoun* contains in itself the force of the *prepositive* pronoun, together with that connection implied in English by the preposition *of*, and in the ancient languages by the *genitive case*. When one says, *vir sapit qui pauca loquitur*, the relative clause *qui pauca loquitur* expresses that attribute of the man from which his wisdom is inferred: it is conceived by the mind, as stripped of its propositional form, and standing in the place of a substantive noun governed in the genitive case by *vir*. The whole sentence might be thus translated, "the man of little speaking is wise;" or, did the use of the English language admit of it, "the man of he speaks little is wise." In like manner, when it is said, "Man who is born of a woman is of few days and full of trouble;"—the relative clause is equivalent to an *abstract noun* in the genitive case, and the whole might be expressed in the following manner, "man of he is born of a woman is of few days and full of trouble."

We are sensible, that these expressions into which, in the instances adduced, we have resolved the relative clauses, will appear extremely uncouth and offensive; but we mean not to recommend them as common modes of phraseology. Against their being employed as such, present use loudly remonstrates (L). They are introduced only with a view to show the true import of the

G 2

relative

(L) It is worthy of observation, however, that, repugnant as such expressions are to the present idiom of the English language, there is nothing in the nature of the thing that could render the use of them improper. All prepositions, as will be seen afterwards, are expressive of relations subsisting between those objects of which they connect the signs in discourse. Those objects may be denoted, either by single words, and then the preposition will govern a noun; or by assertions, and then it will govern a nominative and a verb. Thus, when it is said, "I came after his departure;" the preposition *after* expresses the relation between two events—*my coming* and *his departure*, and governs a substantive noun: but if it be said, "I came after he departed," the preposition in this case (for, as shall be shown afterwards, it is absurd to call it, in the one instance, a preposition, and in the other a conjunction) expresses the same relation as before, but governs a nominative and a verb.

This last expression is exactly similar to those employed above. When one says, for example, "the man of he speaks little is wise;"—however uncouth the expression may appear from its not being supported by the authority of custom, the preposition *of* is used precisely in the same manner, and serves the very same purpose, as when it is said, "the man of little speaking is wise." In both cases it denotes the relation between the two objects

relative pronoun; and for that purpose they are well adapted. That pronoun seems to be of use only when there is a deficiency of *adjectives* or *substantives* to denote some *complex attribute* by which we want to *limit a general term* or *expression*. Where such adjectives or substantives exist in language, we may indeed use the *relative* or not at pleasure. Thus we may say, *homo qui grandia loquitur*, or *homo grandiloquus*; because the *adjective* and the *relative clause* are precisely of the same meaning. But if the Latins were called upon to translate *αὐτοῦ τοῦ μεγάλου*, we believe they must have made use of the *relative pronoun*, as we know not any correspondent adjective in their language.

45
Mr Harris's mistake on this subject.

48. The learned and ingenious Mr Harris has, in his *Treatise on Universal Grammar*, given an analysis of the *relative pronoun* very different from that which has been given by us. The result of his inquiry is, that the *relative* is equivalent to another pronoun, together with an expression of connection of that kind which is denoted by the particle *and*. This analysis he exemplifies, and endeavours to confirm by the following sentence: "Light is a body which moves with great celerity." Now, says he, instead of *which* substitute the words *and it*, and in their united powers you see the force and character of the pronoun here treated. But let any one attentively consider these two expressions,—“Light is a body *which* moves with great celerity,”—and “Light is a body *and it* moves with great celerity;” and he will find that they are not precisely equivalent. For to speak in the language of logic, there is in the *first* but one proposition, of which the *subject* is *light*, and the *predicate* a complex term expressed by the words—*body which moves with great celerity*. In the *second* there are two propositions, or *two predications* concerning light;—first, *that it is a body*; and secondly, *that it moves with great celerity*. The *relative clause*, in the first case, expresses a *property* of the antecedent *body*, which with that property is predicated of the *subject light*; in the second case, this property is removed from the *predicate* of which it was an essential part, and is improperly converted into a new *predication*

of the *subject*. The sentence may be resolved upon our principles, and its precise import preserved; as—“Light is a body *of it moves with great celerity*,” the clause—“it moves with great celerity,” is conceived by the mind as having the force of an *abstract substantive*, and is connected with the antecedent body by the preposition *of*, answering to the termination of the genitive case. This abstract substantive thus connected expresses a *quality* of the *body light*. But by this example Mr Harris's doctrine is not exhibited in all its absurdity: let us try it by another.

Suppose the following assertion to be true; “CHARLES XII. was the only monarch who conquered kingdoms to bestow them on his friends.” Here it is evident there is but one proposition, of which the predicate is expressed by the words—“only monarch who conquered kingdoms to bestow them on his friends;” so that the *relative clause* is a *necessary part* of the predicate, and has, like an *abstract noun* in the genitive case, the effect of modifying the general term *monarch*. Resolve this sentence on Mr Harris's principles, and you have two propositions, of which the first is a notorious falsehood:—“Charles XII. was the *only monarch*; and he conquered kingdoms to bestow them on his friends.” But instead of *and* substitute *of*—saying, “Charles XII. was the only monarch *of he conquered kingdoms to bestow them on his friends*,” and you preserve the true import of the expression (M).

49. Are there no cases, then, in which the *relative* may be resolved into the connective *and* with a prepositional pronoun? Undoubtedly there are, and we shall now endeavour to ascertain them.

Adjectives in language have two different effects upon the substantives to which they belong, according to the nature of the attribute which they express. If the attribute expressed by the adjective be competent to all the species of which the substantive is the specific name, it is plain that the adjective does not *modify* or *limit* the substantive, for this obvious reason, that nothing can modify which is not discriminative. Thus, when

46
In some cases Mr Harris's analysis of the relative may be admitted.

objects—*man* and *little speaking*; only in the one it is prefixed to a noun, in the other to an assertory clause of a sentence, the import of which is to be taken as a noun. Custom hath indeed determined that prepositions shall more frequently govern a noun than a nominative and a verb; but they are, in their own nature, equally well adapted to answer both purposes.

But, as the *pronoun* of the third person is merely the substitute of some *noun*, an objector may ask, What noun is here represented by *he*? “The man *of he speaks little* is wise!” Who is meant by the pronoun *he*? We answer, *the man* who is declared to be *wise*. The objection proceeds from inattention to the radical signification of the word *of*, which a late ingenious writer has shown to be the fragment of a Gothic or Anglo-Saxon word, signifying *consequence* or *offspring*. If this be admitted, and, after the proofs which he has given, we think it cannot be denied, the uncouth phrase, “The man *of he speaks little* is wise,” may be thus resolved, “The man, *a consequence* (of his mind is) *he speaks little*, is wise;” or, in other words, “The man, *in consequence* of his speaking little, is wise.” The same acute writer, Mr Horne Tooke, has shown, that *of* and *for*, though of different radical meanings, may often be substituted the one for the other without injury to the sense. Let this substitution be made in the present instance, and the propriety of the phrase will be apparent: “The man is wise. *for he speaks little*.” It must be remembered, however, that such a substitution cannot be made in every instance, because *for* signifies *cause*, and *of* signifies *consequence*.

(M) Mr Harris was probably led into his opinion, from considering the Latin *qui* or *quis* as compounded of *que* and *is* (see *Hermes*, pag. 81, 82. edit. 3d.) But the notion of *Perizonius* is perhaps better founded, who in his notes *ad Sancti Minerv.* considers it as immediately taken from the Greek *τις*, which in the Doric made *τις*, and in the Latin *quis*. For it seems highly probable, as some ingenious writers have endeavoured to show, that the Latin is a dialect of the Greek. Of this at least we are certain, that many words in the former are immediately adopted from the latter.

when Horace says, "*Prata canis albicant pruinis*," the adjective *canis* denotes a quality common to all *hoarfrost*; and therefore cannot modify the *substantive*, because it adds nothing to the conception of which that substantive is the name. But when the attribute expressed by the adjective is competent to some *individuals* only of the species of which the substantive is the name, the adjective has then the effect of *modifying* or *limiting* the substantive. Thus, when one says *vir bonus*, he makes use of an adjective which modifies the substantive *vir*, because it expresses a quality or attribute which does not belong to *all men*.

The clause of a sentence, in which there is a *relative*, as it is in every other respect, so is it in this, equivalent to an *adjective*; it either *modifies*, or does *not modify*, the *antecedent*, according as the *attribute* which it expresses is or is not characteristic of the *species* to which the antecedent belongs. Thus, when it is said, "Man, who is born of a woman, is of few days and full of trouble," the relative clause—*who is born of a woman*, expresses an attribute common to *all men*, and therefore cannot modify. In like manner, when we say—"SOCRATES, who taught moral philosophy, was virtuous,"—the clause, *who taught moral philosophy*, does not modify. In both these instances the relative clause might be omitted; and it might be said with equal truth, "Man is of few days and full of trouble,"—and "SOCRATES was virtuous."

But if it be said, *vir sapit qui pauca loquitur*, the relative clause—*qui pauca loquitur*, modifies the antecedent *vir*; for it is not affirmed of *every man*, that he is wise, but only of *such men as speak little*. So—"Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends;" and, "the man that endureth to the end shall be saved;" with many more examples that will occur to every reader.

47
What these
cases are.

Now it will be found, that it is only when the relative clause expresses such a property or circumstance of the antecedent as does *not* limit its signification, that the *relative pronoun* can be resolved into a *prepositive pronoun* with the conjunction *and*, and that in these cases the relative clause itself is of very little importance. Thus in the assertion,—"*Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends*,"—where the relative clause is *restrictive*, the *who* cannot be resolved into *and he* consistently with truth or common sense. But in the expression, "Man, who is born of a woman, is of few days and full of trouble," the relative *who* may be so resolved, at least without violating truth;—"Man is of few days and full of trouble, and he is born of a woman." The only difference between the sentence with the relative *who*, and the same sentence *thus resolved*,—is—that, in the former case, it contains but *one predication*; in the latter *two*, and these but loosely connected.

50. Thus then it appears that the general analysis of the *relative pronoun* is into the particle *of*, and a *prepositive pronoun*; but that there are also occasions on which it may be resolved into a *prepositive pronoun* and the particle *and*, without materially altering the sense. Now what is the reason of this distinction?

If the relative clause be equivalent to an *adjective*, or to an *abstract substantive* in the genitive case, it is easy to see that the relative itself may, in every instance, be

resolved into another pronoun and the particle *of*; but it will not perhaps be quite so evident how it should in any instance be resolved by *and*. This last analysis has its foundation in the nature of the particles *of* and *and*; or, to speak more properly, in the nature of the attribute which the relative clause expresses. Both the particles *of* and *and* are used to link or join conceptions together; but with this difference, that *of* has the effect of making the conceptions it connects figure in the mind as *one object*; whereas the conceptions connected by *and* are still conceived *separately as before*. To explain ourselves by an example: suppose we take two words, *man* and *virtue*, which denote two distinct ideas or conceptions, and join them together by the particle *of*, saying *man of virtue*; the mind no longer views them separately as significant of *two* conceptions, but of *one*. Take the same words, and join them together by the particle *and*, saying *man and virtue*: the conceptions denoted by *man* and *virtue* are still viewed separately as *two*; notice is only given that they are *collaterally connected*.

This being the case, it follows, that when the relative modifies the antecedent, or, in other words, when the *relative clause* and the *antecedent* denote but *one conception*, the relative must then be resolved by *of*, in order to preserve this *unity of conception*. But when the relative does *not* modify the antecedent; that is, when its clause does not express any *necessary* part of a complex conception; then the conceptions or ideas denoted by the *relative clause* and the *antecedent* may be viewed separately as *two*; and therefore the relative may be resolved into the corresponding prepositive pronoun and the particle *and*.

To state this reasoning in a light somewhat different. As every relative clause, which expresses an attribute that is *not* applicable to a *whole genus* or *species*, must necessarily *modify* some *general term*, that is, *restrict* its signification; and as that general term must belong either to the *subject* or to the *predicate* of a proposition; it is evident, that every *such* relative clause is a *necessary part* of that *subject* or *predicate* in which its *antecedent* stands. If therefore a relative clause, which *modifies*, be taken *away* either from the *subject* or the *predicate* of a proposition; or if that *connection*, in *consequence of which* it modifies, be *dissolved* (which is always done when the relative is resolved by *and*); the proposition itself will not hold true. The reason is, that the *subject* or the *predicate* becomes then too general: for, in the *one* case, something is predicated of a *whole genus* or *species*, which can be predicated only of some *individuals* of that genus or species; and in the *other*, a *general* predication is made where only a *particular* one can be applied. Thus, if it be said, "All men who transgress the laws are deserving of punishment;" the *subject* of the proposition is expressed by the words, "all men who transgress the laws." Take the clause of the relative "who transgress the laws"—away, and say, "all men are deserving of punishment;" and you have a proposition which is not true, because that is affirmed of the *whole species* which can be affirmed only of *some individuals*. Retaining now the clause of the relative, but resolving it by *and*, you have the same proposition as before; and together with it, in this instance, *another* which is equally false:—"All men, and they transgress."

gress the laws, are deserving of punishment;" that is, "all men are deserving of punishment, and all men transgress the laws."

But when the attribute expressed by the clause of the relative is characteristic of the *genus* or *species* of the antecedent, and consequently applicable to every individual which that genus or species comprehends, the relative clause may be entirely omitted without affecting the truth of the proposition, which is already as general as it can be. As in this case the import of the relative clause is *not restrictive* of the signification of the antecedent, it is of little consequence whether the attribute be represented by the connective part of the relative, as *of* the antecedent, or be affirmed to belong to the antecedent in a *separate assertion*. Thus it matters not much, whether we say, "Man, who is subject to death, ought not to be too much elated;" that is, according to our analysis,—"*Man of he is subject to death, ought not to be too much elated;*" or, forming the relative clause into a separate assertion, and connecting the two by the particle *and*, we say, "Man, and he is subject to death, ought not to be too much elated." In the one sentence, indeed, the *reason* is implied *why* man should not be too much elated, viz. *his being subject to death*: in the other, *no reason* is assigned for this; we only affirm that man is subject to death, and *likewise* that he should not be too much elated: but as both affirmations are equally true and evident, it is of little consequence, in such a case as this, whether the reason upon which either is founded be implied or not.

48
Conclusion
respecting
the relative
pronoun.

51. From the whole of this tedious investigation, we flatter ourselves that the following conclusions are deduced and sufficiently established: 1st, That the *relative pronoun* contains in itself the united powers of a *connective* and *another pronoun*. 2dly, That *of* is the connective of which, together with another *pronoun*, it contains the powers, as in every possible instance it may be resolved into these constituent parts, and the *import* of the sentence in which it has place remain *unaltered*. 3dly, That the *relative clause of a sentence* has the import of an *abstract substantive*, in the ancient languages, in the *genitive case*; in English, with the particle *of* prefixed. 4thly, That the *relative pronoun* is of *necessary use* only where there is a deficiency of *adjectives* or *substantives* to denote some *complex attribute*, by which we want to limit a *general term* or *expression*; but that where such adjectives or substantives exist in language, we may use the *relative* or not at pleasure. And, 5thly, That though, in cases where the *relative clause* does not limit a *general term*, the *relative pronoun* may, without violating truth, be analysed by *and*; yet such analysis is never proper, as it gives *two predicates* to the same *subject*, which, in the original proposition, had but *one predicate*.

52. If the clause of the relative be equivalent to an adjective, as in every instance it seems to be, it will naturally occur, that, in the ancient languages, the relative should agree with its antecedent in *gender*, *number*, and *case*. They do agree for the most part in *gender* and *number*; in *case* they cannot often, because the very intention of introducing a *relative* into lan-

guage is to represent the antecedent in a *different case*. Whenever we have occasion to use a *substantive* or *noun* in a clause of a sentence, and afterwards to express by *another clause*, in which there is a verb, an *attribute* of the *object* denoted by that *substantive*, we then employ the *relative pronoun*. Now it seldom happens that the two clauses admit of the same *regimen*; and hence the *case* of the *relative* is often *necessarily different* from that of the antecedent, as the *case* of each must be accommodated to the clause in which it is found. Thus we cannot say, "*Deus qui colimus bonus est;*" but, "*Deus quem colimus bonus est;*" because the *regimen* of the verb *colo* is always the *accusative*.

This shows the necessity of introducing a relative in-⁴⁹ Why the relative is more useful in the learned languages than in the English.
to those languages which give inflexions to their nouns. Were all the nouns of a language indeclinable, there would be little occasion for a relative; and accordingly in English it is often omitted. Examples are frequent in our best authors. Suffice it to quote the following.

"For I have *business* would employ an age."

Jane Shore.

"I had several *men* died in my ship of calentures."

Swift.

"They who affect to guess at the *object* they cannot see."

Bolingbroke.

We are not ignorant that our most eminent grammarians consider such expressions as chargeable with impropriety; and we are far from recommending them in any dignified or solemn composition. But in the instances adduced there is not the smallest degree of *obscurity*; at least there is none occasioned by the *omission of the relative*. The reason seems to be, that the mind can easily, by an effort of its own, make the *antecedent* unite, first with the one clause, and then with the other. Thus when it is said—"I have *business* would employ an age;" the mind can, without any difficulty, as the word *business* has no inflexions, consider it first as the objective case after *have*, and then as the nominative to *would employ*: but this cannot be so easily done in the ancient languages, where the termination of the noun is changed by the variation of its cases.

53. Both in the learned and in the living languages the relative has different *forms*, corresponding to the different *genders of nouns*; and by these it gives notice whether it is applied to *persons*, or to *things without life*. Thus in the English language we say, *The man* or *the woman* *who* went to Rome; *The tree* *which* stands on yonder plain. It admits likewise, when applied to males or females, a variation of cases similar to that of the *personal pronouns*. Thus we say, *The man* *whose* book is now before me; *The man* or *woman* *whom* I saw yesterday: but the neuter admits of no such distinction (N); as we say *the tree* *which* I saw, as well as *the tree* *which* stands on yonder plain. In modern languages the relative admits not of any distinction to denote *number*: for we say, *The* *MAN* or *the* *MEN* *who* came yesterday; *The* *MAN* or *the* *MEN* *of* *whom* I speak.

54. In English, the word *that*, which by some has⁵⁰ The word that often supplies the place of this pronoun.
been called a *demonstrative pronoun*, by others a *pronominal article*, and by us a *definite article*, is often used instead of the *relative*, as in the following examples: "He

(N) "*Whose* is by some authors made the possessive case of *which*, and applied to things as well as persons; I think, improperly." Lowth.

"He is the same man *that* I saw yesterday:—He was the ablest prince *that* ever filled a throne." With regard to the principle upon which this acceptance of the word *that* depends, we offer the following conjecture.

51
And why
it does so.

In English, from the cool and phlegmatic arrangement of the language, occasioned by the want of inflexions and conjugations, the place of every part of a sentence is almost uniformly determined, and very little variety is allowed in the collocation of the words. The adjective is almost always placed in apposition with its substantive, and the nominative with its verb. In consequence of this uniformity in the collocation of the words, the mind acquires a habit of connecting in idea any kind of word with the place in which it is used to stand; and is naturally led to consider every word that stands in such a place as belonging to such a class. Hence it is, we imagine, that the definitive *that* passes into the nature of the relative pronoun; as in those instances in which it occupies the place of the relative, it was natural to consider it as having the same import. Yet the word *that* has undoubtedly in itself no more the force of the relative pronoun than *the* or *this*, or any other definitive whatever. In such expressions as the foregoing, it is not improbable that originally the clause of the definitive *that*, which we now call the relative clause, was thrown in as a kind of modifying circumstance in the following manner: "The book (I read that) is elegant;" where the speaker, finding the word *book* too general for his purpose, throws in a clause to qualify and restrict it, or to confine his affirmation to that particular book which he is then reading. We can easily suppose, that through time the definitive *that* in such an expression might be transposed or removed from its own place to that of the relative: so that the expression would run thus, "The book *that* I read is elegant;" which would be considered as precisely equivalent to "The book *which* I read is elegant." This opinion is not a little confirmed by a similar use of the article in Greek, which, though undoubtedly a definitive like the English *the*, is often used instead of the relative pronoun. Numberless examples may be found in *Homer* and *Herodotus*, especially in the latter, who seldom uses what is properly called the relative. We shall produce one instance from each.

Εἰσαὶ Ἀτρεΐδην Ἀγαμέμνονα ΤΟΝ περὶ πάντων
Ζεὺς ἐνέκερ ποσειδί διαμπερές. *Iliad* x. 88.

Ὀρκιοῖσι γὰρ μεγαλοῖσι καὶ ἰχνοῖσι (Ἀθηναῖοι *scil.*) δεκά
εἴσα χρησιεῖναι νομοῖσι ΤΟΤΕ ἀν σφίσι Σόλων ἐηλεῖ.
Herod. *Glio.*

52
Interroga-
tive pro-
nouns

55. We have said that the interrogative pronouns, as they are called, *who*, *which*, *what*, are intimately connected with relatives; we now affirm, that the two first of these words are nothing but relatives, and that the last contains in itself the united powers of a relative and definitive. With respect to cases, number, and gender, the words *who* and *which*, when employed as interrogatives, differ not from the same words when employed as relatives; and we hold it as a maxim, without which science could not be applied to the subject of language, that the same word has always the same radical import in whatever different situations it may be placed. To understand this, it is necessary to observe, that all men have a natural propensity to communicate their thoughts

in the fewest words possible: hence it follows, that words are often omitted which are necessary to complete the construction of the sentence; and this no where happens more frequently than in the use of *who* and *which*. In sentences where these words are confessedly relatives, we often find them without an antecedent; as,

"Who steals my purse, steals trash." *Shakespeare.*

"Which *who* would learn, as soon may tell the sands." *Dryden.*

"Qui *Bavium* non edit, amet tua carmina, *Mævi.* *Virg.*

That is, "*He* who steals my purse, &c.;" "*Which* he who would learn as soon, &c.;" and "*Ille qui Bavium non edit,*" &c. Such abbreviations occasion no obscurity, because from previous circumstances the hearer knows the mind of the speaker and the persons to whom he refers. But it is not with respect to the relative and antecedent only that such abbreviations have place: in sentences of a different form, whole clauses are sometimes omitted, while the meaning of the speaker is made sufficiently plain. Thus when king Richard III. having lost his horse in battle, exclaims,

"A horse! a horse! my kingdom for a horse!"

there is no complete thought expressed; but the circumstances in which the king then was, enabled those about him to understand that he wanted a horse. Accordingly Catesby answers him,

"Withdraw, my lord, I'll help you to a horse."

In like manner when a person asks a question, his expression is frequently incomplete; but the tone of his voice, or some other circumstance, enables us to ascertain his meaning, and to supply, if we please, the words that are omitted. Thus when it is said, *An fecisti?* nothing more is expressed than, *If you did it* (the Latin *an* being nothing else but the Greek *an*, *si*); but some circumstance enables the person who hears it to know that the meaning is, "Say if you did it." Let us apply these observations to the words *who* and *which*. If these words be relatives, and if our analysis of the relative be just, it is obvious, that no complete meaning can be contained in the clause, "Who is your principal friend?" for that clause contains nothing more than the circumstance of being your principal friend predicated of some unknown person; "of he is your principal friend." That this is indeed the case, every man may be convinced, by asking himself what he means by the interrogative *who* in such a sentence; and for he will find it impossible to affix to it any meaning without supplying an antecedent clause, by which that which is called an interrogative will be immediately converted into the relative pronoun. The custom, however, of language, and the tone of voice with which the relative clause is uttered, intimates, without the help of the antecedent, the wish of the speaker to be informed by the person addressed of the name and designation of his principal friend; and we know that the sentence when completed is, "Tell me the name and designation of the person who is your principal friend." Again, when the prophet says, "Who is this that cometh from Edom, with dyed garments from Bozrah?" he utters but part of a sentence, which when completed will run thus: "Describe the person who cometh from Edom (this is that person), with dyed garments from Bozrah." He sees a person coming from Edom, of whose name and designation he is ignorant; he calls upon some one for information concerning

53
Are merely
relative;
and

cerning these particulars; and that there may be no mistake, he describes the unknown person as having *dyed garments from Bozrah*; but lest even that description should not be sufficiently accurate, he throws in the definitive clause, *this is that person*, pointing at him, we may suppose, with his finger.—*Which*, used as an interrogative, indicates a wish of knowing a particular person or thing out of more than one mentioned; as, “Which of the two did it?” that is, “Tell me the one of the two which did it?” for in old English *which* as a *relative* is often used, where in modern English we should say *who*; and that mode of speech is still retained when the antecedent is omitted, and the relative clause employed to indicate such a wish as that before us. *What* includes in itself the signification of a *definitive* and a *relative pronoun*; as, “from *what* has gone before, *what* follows may easily be guessed;” where the word *what* is equivalent to *that which*. When therefore we say, “What rude fellow is that?” our meaning is, “Describe that person who is that rude fellow.” Upon the whole, then, it is evident, that the words called *interrogatives* are merely *relative pronouns*; and that interrogative sentences are *relative clauses* uttered in such circumstances as to enable the hearer to supply the antecedents necessary to complete the meaning.

54
Interrogative sentences relative clauses.

56. To conclude: We have seen that SUBSTANTIVES are either *primary* or *secondary*; or, in other words, NOUNS OR PRONOUNS. NOUNS denote *substances*, and those either *natural*, *artificial*, or *abstract*. They moreover denote things either *general*, or *special*, or *particular*; and a *general* or *specific* name is made to denote an *individual* by means of words called *articles* or *definitives*. PRONOUNS are the substitutes of NOUNS, and are either *prepositive* or *subjunctive*. The PREPOSITIVE is distinguished into *three* orders, called the *first*, the *second*, and the *third* person. The SUBJUNCTIVE, otherwise called the *RELATIVE*, includes the powers of all those three, having *superadded* as of its own the peculiar force of a *connective*.

CHAPTER IV.

Of VERBS.

57. THE words which we have hitherto considered are commonly called *substantives* primary or secondary, and *definitives*; because *nouns* are significant of *substances*; *pronouns* are the substitutes of *nouns*; and the *article* serves to ascertain the *extent* of the *noun*, and to determine whether on any occasion it be significant of a whole *class* of substances, or only of *one individual*. But substances are of importance to mankind only on account of their various *qualities* or *attributes*; for their internal texture is a thing of which we are profoundly ignorant, and with which we have no manner of concern. Thus, experience teaches us, that certain vegetables are pleasant to the taste, and wholesome food; whilst others are unpleasant and poisonous. The former kinds are valuable only for their *qualities* or *attributes*; and they are the *qualities* or *attributes* of the latter that make them worthless or hurtful. A horse is strong, and swift, and docile; and may be trained to carry a man on a journey, or to drag a plough. It is for his *strength*, *swiftness*, and *docility*, that he is the most valuable of all quadrupeds. One man is brave,

N^o 142.

55
Substances of importance only for their qualities or attributes.

another learned, and another eloquent; and by possessing these different *qualities* or *attributes*, each is fitted for a different station in society. It is plain therefore, that in contemplating substances, our attention must be principally bestowed upon their *qualities*, and that the words which serve to denote these qualities must be an essential part of language. Such words are in general called *attributives*; and are of three sorts, *Verbs*, *Participles*, and *Adjectives*.

56
There is a class of words called attributives: These are, verbs, participles, and adjectives.

58. Of all the constituent parts of speech none has given the grammarians greater trouble than the VERB. The vast variety of circumstances which it blends together in one word, throws very considerable difficulties in the way of him who attempts to analyse it and ascertain its nature; at the same time, that by its eminent use in language, it is intitled to all the attention which can be bestowed upon it. To the discussion of the verb, Mr Harris, whose notions of this as of the other parts of speech have been generally adopted by the subsequent writers on grammar, has dedicated a large proportion of his book, in which he has thrown out many excellent observations, mixed, as it appears to us, with several errors. We have already observed, that no man is ignorant when he uses what is called a *verb* and when a *noun*. Every schoolboy knows, that the words *IS*, *LOVETH*, *WALKETH*, *STANDETH*, in *English*; and *EST*, *AMAT*, *AMATUR*, *AMBULAT*, *STAT*, in *Latin*, are VERBS: he knows likewise that they are of different *kinds*; that some of them are said to be *active*, some *passive*, and some *neuter*. But it should seem, that the first object of our investigation ought to be the *characteristic* of the verb, or that which all these words have in *common*, and which constitutes them VERBS, distinguishing them from *every other species of words*. Now it is obvious to the slightest attention, that every verb, whether *active*, *passive*, or *neuter*, may be resolved into the substantive-verb *IS*, and another *attributive*: for *LOVETH* is of the same import with *is loving*; *WALKETH*, with *is walking*; and *AMAT*, with *amans* *EST*. But *loving*, *walking*, and *amans*, are not verbs: whence it follows, that the *characteristic* of the verb, that which constitutes it *what it is*, and cannot be expressed by other words, must be that which is signified by the word *IS*; and to us that appears to be neither more nor less than *assertion*.

57
The difficulty of ascertaining the nature of the verb.

58
The characteristic of the verb.

ASSERTION therefore, or PREDICATION, is certainly the very ESSENCE of the verb, as being that part of its office, and that part only, which cannot be discharged by other kinds of words. Every other circumstance which the verb includes, such as *attribute*, *mode*, *time*, &c. it may be possible to express by *adjectives*, *participles*, and *adverbs*; but without a *verb* it is impossible to predicate, to affirm or deny, any one thing of any other thing. The office of the VERB, then, when stripped of all *accidental* circumstances, seems to be merely this, “To join together the subject and predicate of a proposition:” its powers are analogous to those of the sign $+$ in *Algebra*, which does not affect the separate *value* of the quantities between which it is placed, but only indicates their *union* or *coalescence*. To explain by an example: When we say, *Cicero eloquens*, *Cicero wise*; these are imperfect sentences, though they denote a substance and an attribute. The reason is, that they want an *assertion*, to show that such an attribute appertains to such a substance. But when we insert the word *was*,

we

we join the substance and attribute together; we give notice that the *wisdom* and *eloquence* are applied to *Cicero*, and we do nothing more; we neither increase the wisdom nor diminish it, we neither make it real nor imaginary; for it was supposed in all its extent when the words *Cicero* and *wise* stood independent of each other. We may indeed use the *verb* in a form which implies not an *assertion only*, but likewise an *attribute*; as when we say, *George writeth*, or *George walketh*: But as *whiteness* or any other particular colour is not of the *essence* of a *horse*, an animal which is found of *all* colours; so in the phrases quoted, the *attribute*, though implied, is not of the *essence* of the *verb*; for it may be equally well expressed by other words: *George is writing*, and *George is walking*, are phrases of the very same import with *George writeth* and *George walketh*.

59. In resolving every verb, whether active, passive, or neuter, into the substantive-verb *is* and another attributive, we have the honour to agree with all the grammarians; but to the word *is* itself the learned author of *Hermes* has given a meaning which, as a verb, it does not admit. He observes, that before any thing can be the subject of a proposition, it must *exist*: that all existence is either *absolute* or *qualified*, *mutable* or *immutable*: that the verb *is* can by itself express *absolute existence*, but never the *qualified*, without subjoining the particular form; and that it signifies both *mutable* and *immutable* existence, having in these cases different meanings; altho' the sentences which he gives as examples are evidently constructed in the same manner and consist of the same parts of speech. His examples are: of *absolute* existence, *B is*; of *qualified*, *B is an animal*; of *mutable*, *This orange is ripe*; of *immutable*, *The diameter of the square is incommensurable with its side*. But if *predication* be the essence of verb, all this is nothing to the purpose, and part of it is not true. It is not true that the verb *is* ever varies its signification; for it hath as *verb* no connection with existence of any kind. All such circumstances are superadded to its verbal nature; or, to speak more accurately, we infer such circumstances from our previous knowledge of the objects concerning which the predication is made. When we say, "*this orange is ripe*," we do indeed mean, as Mr Harris observes, that it *is so now at this present* in opposition to *past* and *future* time: but it is not the verb *is*, but the definitive *THIS*, which fixes the *time of maturity*, as well as the *place* of the orange; for had we said, *oranges ARE ripe*, we might have been properly asked, *When and where* are they ripe? although the same verb *is* is used in both sentences. Even in the sentence "*B is*," *absolute* existence (the most simple of all) is *inferred*, and not *expressed*, by the *verb*; and the inference is made from this obvious principle, "That when one utters a mark of *predication*, we naturally conclude that he means to predicate *something* of the subject." If he adds no *specific* predication, as *B is*

VOL. VIII. Part I.

ROUND, we apply to *B* the most general that we can; and what other species is so general as *existence*?

That the idea of existence, considered as *mutable* or *immutable*, is not contained in the verb *is* itself, but is derived from our knowledge of the objects concerning which the predication is made, appears manifestly from this: That if a person be supposed ignorant of the meaning of the words *GOD* and *MAN*, whilst he knows that of *is*; the uttering of the two propositions, *God is happy*, and *this man is happy*, will give him no notice of existence considered as *mutable* or *immutable*, *temporary* or *eternal* (o). His conclusion with respect to these modes of existence, if any such conclusion be drawn at all, must be derived entirely from his previous knowledge of the nature of *God* and the nature of *man*.

Some of our readers may possibly think this notion of *verb* too abstract and metaphysical; yet what other circumstance than *mere predication* is essential to that species of words? We say *essential*; for we are here inquiring, not what is expressed by each *individual verb*, but what it is which is equally expressed by *all verbs*, and which distinguishes them from the *other parts of speech*. And if it be true, that every thing which the verb implies, *predication alone excepted*, may be expressed by other parts of speech, and that *no other part of speech* can predicate; then we think ourselves warranted to affirm, that *simple predication* is the *essential characteristic* of *VERB*, that *every word* which predicates is a *VERB*, and that *nothing* is so which does not predicate.

It must not, however, be concealed, that a doctrine very different from this has been lately maintained by a writer of distinguished abilities. "We have *energy* expressed," says Dr Gregory (p), "and of course a verb constituted, *without affirmation*, when we wish or command; *without command*, when we affirm or wish; *without wish*, when we command or affirm: yet in all these cases we have equally and indisputably a verb."

That in all these cases we have a *verb*, is indeed indisputable; but we hold it to be equally indisputable, that in all these cases we have *affirmation*. The ingenious author has given no direct example of a *wish* or *command* uttered *without affirmation*; and a feeling or sentiment which is *not uttered* has nothing to do with language: but he has given a sentence in which there are three verbs, that in his opinion denote *no affirmation*, but a very plain *supposition*. If a *supposition* can be expressed without affirmation, we shall very readily allow that a *wish* or *command* may be so expressed likewise. The Doctor's supposition is thus expressed: "*Had any punishment ever overtaken you for your broken vows; were but one of your teeth growing black, or even were but one of your nails growing less beautiful, I should believe you.*" It is almost superfluous to observe, that to every *verb* not in the infinitive mode there must be a *nominative*, and to every *active verb* an *object*, whatever be the arrangement of the sentence in which such verbs are found. These

H

are

(o) The truth of this observation may be proved by experiment, by uttering to a man of good common sense these two propositions, taking care to express the words *God* and *man* in a language which he does not understand. Thus, *Deus is happy*, and *hic homo is happy*, uttered to a man totally unacquainted with the Latin tongue, will convey no notice of existence considered as *mutable* or *immutable*, &c.

(p) *THEORY of the MOODS of VERBS*, published in Vol. II. of the *TRANSACTIONS of the ROYAL SOCIETY of EDINBURGH*.

are truths known to every schoolboy; the reasons of them shall be given afterwards. It is likewise undeniable, that in the sentence before us, the nominative to *had* is *any punishment*; to the first *were*, *one of your teeth*; and to the second, *one of your nails*. But the sentence arranged in grammatical order, with the several nominatives before their respective verbs, is evidently *elliptical*; and the conjunction *if* must be supplied, as well to complete the construction as to make sense of the passage. *If* any punishment had ever overtaken you; *if* but one of your teeth were growing black, or even *if* but one of your nails were growing less beautiful, I should believe you." Now it has lately been proved, by such evidence as leaves no room for doubt, that *if*, though called a *conjunction*, is in fact a *verb* in the imperative mode, of the same import with *give*; so that we may substitute the one for the other without in the smallest degree altering the sense. The sentence will then run thus: "Give any punishment had ever overtaken you; *give* but one of your teeth were growing black, &c. I should believe you." It is therefore so far from being true, that *had* and *were*, when the sentence is completed, express *no* affirmation; that it is only upon *granting* the truth of the affirmation which they denote, that the speaker says "I should believe you." "Any punishment had ever overtaken you," is plainly an affirmation; *if*, *give* that affirmation, *admit its truth*, "I should believe you." But it cannot be supposed that *had* and *were* change their significations by a mere change of place, or that by being removed from the middle to the beginning of a clause, they lose their original import, and come to denote something entirely different. Were this the case, every attempt to ascertain and fix the general principles of grammar would be as ridiculous as an attempt to arrest the course of time. For what purpose then, it may be asked, if the verb *always* denotes affirmation, is it removed from the middle to the beginning of the clause, when *supposition* is implied as in the present instance? We answer, that *supposition* is neither more nor less than *conditional affirmation*; that when such affirmation is completely expressed, the verb is not removed to the beginning of the clause; and that such removal takes place only when the clause is *elliptical*, being merely an artificial contrivance in language, to show the reader or hearer that some such word as *if*, demanding the truth of the affirmation, is omitted for the sake of dispatch. This is evident; for when the word requiring the affirmation to be granted is supplied, the verb must be restored to its place in the middle of the clause. Such abbreviations, and such contrivances to mark them, are frequent in all languages, as will be seen more clearly when we come to treat of modes.

Upon the whole, notwithstanding the deference which we willingly pay to this very masterly writer, we are compelled reluctantly to differ from him, and still to think that *simple predication* is the very essence of the *VERB*.

Should we be required to exemplify our theory by language, and to produce instances of this simplified verb in practice, we might answer, that the not being able to produce such instances would be no good argument against the truth of our principles. It is the nature of language to express many circumstances by the same word, all of which however are not *essential* to distinguish the *species* to which that word belongs from the *other species* of words; and it is the nature of man to infer from discourse many things which are not *actually expressed*. Perhaps, however, something nearly approaching to an exemplification of our idea of a *simple verb* will be found in the following proposition: "The three angles of every plane triangle are equal to two right angles." What other office the verb *are* here performs than simply to join the *subject* and *predicate*, it is difficult to perceive. It does not give notice of time; or such notice, if given, is an imperfection; for the truth of the proposition is independent on time. Neither ought it to imply *existence*; for the proposition would be true, were there neither a triangle nor a right angle in nature.

This idea of *verb*, when it is well considered, we hope will be found just; but should any of our readers suspect it of novelty, and on that account be disposed to condemn it, we have only to request that he will restrain his censure till he has examined the writings of others, and nicely observed the several postures of his own mind in discourse; for meditation may perhaps show him that our theory is not false, and inquiry will satisfy him that it is not novel (Q).

60. But although it is certain that *assertion*, and *assertion only*, is *essential* to the *verb*, yet the greater part of that species of words which grammarians call *verbs* are used to denote an *attribute* as well as an *assertion*; or, in the language of logic, they express both the *copula* and the *predicate* of a proposition: thus, *he liveth*, *he writeth*, *he walketh*, are phrases equivalent in all respects to—*he is living*, *he is writing*, *he is walking*. Now, of attributes, some have their essence in *motion*, as *walking*; some in the *privation of motion*, as *resting*; and others have *nothing to do with either motion or its privation*, as *white* and *black*. But all *motion* and all *privation of motion* imply *time* as their *concomitant*; and a *substance* may have an *attribute* to-day which it had *not yesterday*, and will not have to-morrow. This is self-evident; for a man may be at rest to-day who yesterday was walking, and to-morrow will be on horseback; and a sheet of paper may have been *white* yesterday, which to-day is black,

(Q) "Besides words, which are names of ideas in the mind, there are a great many others that are made use of, to signify the connection that the mind gives to ideas or propositions one with another. The mind in communicating its thoughts to others, does not only need signs of the ideas it has then before it, but others also, to show or intimate some particular action of its own at that time relating to those ideas. This it does several ways; as *is* and *is not* are the general marks of the mind affirming or denying." Locke on Human Understanding.

"Verbum est pars orationis variabilis, aliquid de re aliqua dici seu affirmari significans. Vulgaris verbi definitio est, quod sit pars orationis, quæ agere, pati, aut esse significet. Sed nostra accuratior, magisque ex ipsa verbi cujusvis natura petita videtur. Cæterum *to affirmari* laxiore hic sensu accipimus, pro eo quod prædicari Dialectici appellant, quo non modo affirmationes strictius sic dictæ, sed negationes etiam interrogationesque includuntur." Ruddimanni Grammaticæ Institutiones; see also Dr Beattie's Theory of Language.

63
All verbs
denote
time; hence
the origin
of tenses.

black, and at some future time will be of a different colour. As, therefore, all motions and their privation imply time; and as a proposition may be true at one time, which is not true at another; all VERBS, as well those which denote both an attribute and an assertion, as those which denote an assertion only, come to denote TIME also: Hence the origin and use of tenses, which are so many different forms assigned to each verb, to show, without altering its principal signification, the various TIMES in which the assertion expressed by it may be true. Whether these various forms of the verb be essential to language, it is vain to dispute. They have place in every language with which we are acquainted; and as the use of the verb is to affirm one thing of another, it is absolutely necessary that the time, when such or such an affirmation is true, be marked by tenses, or some other contrivance. Concerning tenses, therefore, we shall throw together some observations equally applicable to every language, after premising a general remark or two which seem necessary in order to proceed with precision.

64
All time
past, pre-
sent, or fu-
ture; hence
the tenses
of verbs
are three-
fold.

61. Time, although its essence consists in succession continued and unbroken, may yet be considered by the mind as divided into an infinite number of parts. There is, however, one grand division which necessarily occurs, and to which the different tenses of verbs are in all languages adapted.—Computing from some portion conceived to be present, all time is either past or to come. Hence the tenses of verbs are threefold; some denoting time present, some time past, and others time future.

Again, from the very nature of time, it must be obvious, that all its parts are relative; i. e. that no portion of it can be ascertained by any thing inherent in itself, but only by referring it to some other portion, with respect to which it is past, present, or to come. In this respect time is perfectly analogous to space: for as the space in which any object exists, cannot be described but by stating its relation to some other space; so neither can the time of any attribute or action be determined, but by stating its relation to some other time. When, therefore, we would mark the time of any action or event, we must previously fix upon some point to which we may refer it. If this point be known, the time referred to it will be known also; but if the former be not known, neither will the latter.

Lastly, in contemplating an action, we may have occasion to consider it as going on, or as finished. This distinction is likewise denoted by the different tenses of verbs. In treating therefore of the tenses, there are two things to which attention ought principally to be turned;—the relation which the several tenses have to one another in respect of time; and the notice which they give of an action's being completed or not completed.

65
Different
gramma-
rians have
enumerated
different
numbers of
tenses.

62. Having premised those remarks, we proceed now to the tenses themselves; of which Mr HARRIS has enumerated no fewer than twelve. Of this enumeration we can by no means approve; for, without entering into a minute examination of it, nothing can be more obvious, than that his INCEPTIVE PRESENT—I am going to write—is a FUTURE TENSE; and his COMPLETIVE PRESENT—I have written—a PAST tense. But, as was before observed of the classification of words, we cannot help being of opinion, that, to take the tenses as they are commonly received, and endeavour to ascertain their nature and their differences, is a much more useful exercise, as well as more proper for a work of

this kind, than to raise, as might easily be done, new and hypothetical theories on the subject.

It has been already observed, that all the tenses must necessarily mark relative time. In one sense, this is extremely obvious. The present tense is used in contradistinction to both the past and future, and marks an attribute or action as existing in neither. The past and the future are in like manner used in contradistinction to the present; and mark an attribute or action which exists not now, but which in the one case has existed formerly, in the other will exist at some time coming. But besides this relation of contradistinction subsisting among the tenses, there is another of co-existence, as we may call it, to which it is of great consequence to attend—especially in examining the nature of the present.

66

63. The PRESENT TENSE refers not only to something which is past or future, but also to something with which the attribute or action of the verb is contemporary. This reference is necessarily implied in its very name; for we cannot say of any thing that it is present, without implying at the same time that there is something else with which it is present. Hence it appears with how little reason Mr Harris and others have given us an aorist of the present, as marking present time indefinitely in contradistinction to OTHER presents, which have been called inceptive, extended, and completive presents. For from what has been said it follows, that the present tense is necessarily and from its very nature perfectly indefinite, and can of itself give notice of no precise or determinate portion or point of time whatever. A thing may have been present fifty years ago, may be present now, or at any future period. This tense implies the relation of co-existence between two or more things; but, without some auxiliary circumstance, it cannot in any language mark the particular portion of time in which those things exist. The indefinite nature of this tense is indeed most clearly seen in that use of it in which Mr Harris has styled it the aorist of the present; that is, in cases where it is employed to denote the repetition of an action which the agent is accustomed frequently to perform, or to express propositions of which the truth is evinced by general experience; as in the following examples:

“Hypocrisy—the only evil that walks

“Invisible, except to God alone.”

“Ad penitendum propetat qui cito judicat,” &c.

In these instances it is plain there is no particular time pointed out: the propositions are true, or apprehended as true, at all times. Although the actions, therefore, of walking and hastening are expressed as present, it is impossible from the expressions to determine any precise point of time when they are present.

But if the present tense be thus indefinite, how, it may be asked, are we to ascertain the particular time which is intended? We answer, it is to be ascertained, either by stating the action of the verb as existing in some time already known, or by inference. If, for example, we say,—“Millions of spiritual creatures walk the earth unseen,”—the proposition is general, and the time of walking undetermined. But if we add,—“both when we wake and when we sleep,”—the time is by this addition ascertained and specified; for if the time when men wake and sleep be known, the time when these spirits walk the earth is known also.—When no specifying clause is given by which to determine the time of the present tense, it is very commonly determined by in-

ference. Thus, if one use such an expression as—"He sleeps while I am speaking to him,"—the time of his sleeping is ascertained by the subsequent clause of the sentence; but if it be said simply—"he sleeps"—without assigning any data from which it may be concluded when his sleeping is present, we very naturally infer that it is at the instant we receive the information of his sleeping. Such inferences as this are common in language. The mind is desirous to obtain complete information on every subject; and therefore frequently supplies to itself what is not expressed in the speech of others.

Both these ways of ascertaining the precise time of the present tense, are excellently illustrated by the use of the word present as applied to space. Take a familiar example:—"His brother and he were present when I read the letter." It is at first sight evident that this expression is perfectly indefinite. But if it be said—"His brother and he were present at your house when I read the letter,"—the place of action is then determined, by being referred to a portion of space which is known. If no such reference be made, the person who hears the speech uttered must either remain ignorant of the place intended, or he must ascertain it to himself by inference; and he will probably infer it to be that in which the speaker is at the time of his uttering the indefinite sentence. This leads us to observe, that such inferences are not often made without sufficient foundation. Various circumstances may assist the reader or hearer in making them, and prevent all danger of mistake. He may have the evidence of sense, or of something preceding in the discourse, and a number of other particulars, to justify and warrant his conclusion. Thus, if when sitting by a large fire, one pronounce the words—"I am too warm;" those to whom he addresses his speech are authorized to conclude, that he is too warm at the time of speaking, unless he expressly prevent the drawing of that conclusion by adding some such clause as—"when I wear a great coat."

It is strictly demonstrable, and hath by Mr Harris been in fact demonstrated, that there is no such thing as present time. Yet do we not only conceive time as present and existing, but frequently as extended to a very great degree. We speak not only of the present instant, or the present day, but also of the present year, and even of the present century. This manner of conceiving time is indeed loose and unphilosophical; but it is sufficient for the ordinary purposes of language. To express time as it really is, we ought to say, the passing day, the passing year, and the passing century; but in common discourse we denominate any portion of time present, in which the present now or instant is included, although it is obvious that part of that portion is past, and the remainder of it future. From the very nature of time thus conceived to be present, the tense now under consideration must represent the action of the verb as commenced, and not finished: for as time is in continued succession, and accompanies every action; when any action is not commenced, it exists not in any time, though it may exist hereafter in time which is now future; and when it is finished, it exists no longer in time present, but in time past. Hence the absurdity of introducing into a theory of the tenses an inceptive present and a completive present; for these terms imply each a direct contradiction.

64. After having said so much of the present tense, we shall have but little to say of the PRÆTER-IMPERFECT. It states an action in respect of time, as past; and in respect of progress, as unfinished. *Legebam*—I was reading at some past time, but my reading was then incomplete; I had not finished the book or the letter. We must here observe, however, as we did with respect to the present tense, that although the præter-imperfect represents the action as past, it does not inform us in what precise portion of past time the unfinished action was going on: this circumstance must either be given in separate words, or be inferred by the hearer. If one say simply—*Legebam*, the person to whom he addresses his speech will conclude, that the time of his reading is past with respect to the present time of his speaking. But if he say,—*Legebam antequam venissi*, he expressly states the action of reading as past with respect to the time in which his hearer came to the place where they both are at the time of speaking. The time of the præter-imperfect is always past with respect to the present instant when the imperfect is used, and of this the tense itself gives notice; but it may also be past with respect to some other time, and of this it conveys no information.

If we join two præter-imperfects together, the expression will state the co-existence of two progressive actions, both of which were going on at a time past in respect of some determinate time given or supposed. "*Cum tu scribebas ego legebam*;" "when you were writing I was reading." Hence the præter-imperfect has by some grammarians been called the relative present; a name which, however, is by no means exclusively applicable to this tense. When the præter-imperfect is by the conjunction and joined in the same sentence with a plusquam-perfect, the two tenses express two actions, both prior to the time of speaking; but the one as having continued after the other was finished. Thus, *Eneas* speaking of the destruction of Troy, says, that after having escaped with his father and followers, he returned to the city in quest of his wife, and went directly to his own house; but there, continues he, "*irruerant Danaï, et tectum omne tenebant*;"—"the Greeks had rushed in," that action was over and completed before his arrival; but the act of "possessing the whole house," *tenebant*, was not over, but still continuing.

65. But it is necessary that the verb denote actions which were complete or perfect in past time, as well as those which were incomplete or imperfect. For this purpose, Greek and English verbs have an aorist, a præter-perfect, and a plusquam-perfect. Of these the Latin has only the two last. The præter-perfect in that language sustains a twofold character: it performs the office of the Greek and English aorist, as well as of the præter-perfect properly so called; that is, it denotes a finished action at some indefinite past time, as well as at some time which is both past and definite.

In attempting to analyse the signification of complex terms, by which we here mean words that include in their signification a variety of particulars, it is of great advantage to have these particulars separately expressed by different words in another language. Now the English has resolved the tenses, which in the Greek and Latin languages are denominated the aorist and the præter-perfect, by means of what are commonly called auxiliary verbs, expressing the former by the verb *did*, and the latter by the verb *have*. In examining there-

67
The præter-imperfect.

68
The aorist and præter-perfect.

fore

fore the *aorist* and *prater-perfect*, it will be of use to inquire into the import of *these verbs*.

Did is evidently the *aorist* of the verb *to do*; a verb of the most general signification, as it denotes *action* of every kind. It expresses the *finished performance* of some *action*, the completion of which must of course have taken place in some portion of *past time*. “*I did write* or *I wrote* (these expressions being equivalent) yesterday, a month, a year ago,” &c. But the import of *did* being so very general, it can convey no *determinate* meaning without being limited by the addition of some *particular action*; and this *addition*, however expressed, is to be considered in the same light as an *accusative case*, governed by the active verb *did*; for it produces exactly the same effect. Ἐγραψα, *scripsi*, *I did write*; that is, “at some *past time* I performed the *action* of writing, and *finished it*.”

The verb *have*, which is included in the *prater-perfect*, is plainly a verb of the *present tense* denoting *possession*. But a man may possess one thing as well as another; and therefore *have* requires *limitation*, for the very same reason that *did* requires it, namely, because its signification is *perfectly general*. Now this *limitation*, whatever it is, must be conceived as the *thing possessed*; and in instances where *have* is limited by a *noun*, this is obvious, and universally acknowledged: “*I have a gold watch*,” is, “*I possess a gold watch*.” But to annex the same meaning to the word *have*, when used as an *auxiliary verb*, is an idea we believe not common, and which may perhaps be thought whimsical; yet what other meaning *can* be affixed to it? To suppose that words have not each a *radical* and *determinate* signification, is to suppose language a subject incapable of philosophical investigation; and to suppose, with Mr Harris, that there are words entirely devoid of signification, is at once to render all inquiries after the principles of grammar nugatory and ridiculous. We conceive, then, that each of the phrases, γράφει ἐπιστολάν, *scripsi epistolam*, *I HAVE written a letter*, is equivalent to the phrase, “*I possess at present the finished action of writing a letter*.” Such an expression may sound *harsh* to the ear, because it is *not in use*: but we often employ expressions, to the *precise* and *proper* meaning of which we do not attend; and if the above be attentively considered, however awkward it may at first appear, nothing will be found in it either improper or absurd.

The *aorist*, then, we conceive to state an action as performed and finished in some *past portion of time*; whilst the *prater-perfect* represents the *past performance* and completion of that action as *now possessed*. And here we may hazard a conjecture why *have*, when used as an auxiliary verb, is always joined with a *past* participle; whereas *did* is joined to a word expressing the *simple action* of the verb, or, as it is called, the *present infinitive*. Of the expression, “*I have written a letter*,” as one part, viz. the verb *have*, denotes *present time*; the other part, viz. *written*, must denote *past time*, to give notice that the action is performed and finished. *Did*, on the other hand, implying *past time*, has no occasion for the *past part* of another verb to give notice of this circumstance; for “*I did write a letter*,” is equivalent to, “at some *past time* I performed and finished the *simple action of writing a letter*.”

The principal distinction in practice between the *aorist* and *prater-perfect* (for the difference seems little in their real import) consists in the *time* by which the performance of the action admits of being *particularly specified*. The *prater-perfect* is always joined with a portion of time which includes the *present now* or *instant*; for otherwise it could not signify, as it always does, the *present possession* of the *finishing* of an action. But the *aorist*, which signifies *no such possession*, is as constantly joined with a portion of *past time* which excludes the *present now* or *instant*. Thus we say, “*I have written a letter this day, this week*,” &c. but, “*I wrote a letter yesterday, last week*,” &c.; and to interchange these expressions of time in Greek and English, where the *aorist* and *prater-perfect* have different forms, would be improper. In *Latin*, indeed, where they have but one form, the impropriety does not appear.

66. Besides the tenses already examined, which are expressive of *past time*, in most languages the verb has another tense called the *plusquam perfect*, in which, however, no difficulty occurs to detain our attention. What the *prater-imperfect* is to the *present tense*, that the *plusquam-perfect* is to the *prater perfect*. The verb *had*, by which it is resolved in English, being evidently the *past time* of *have*, sufficiently explains its meaning and relation to the other tenses: “*I had written a letter*,” is equivalent to the phrase, “*I possessed at some past time the finished action of writing a letter*.”

It is justly observed by Dr Beattie, that the imperfect and plusquam-perfect are very useful, and may be the sources of much elegant expression; and that if one were not taught to distinguish, in respect of meaning as well as of form, these tenses from each other, and the *praterite* from both, one could not pretend to understand, far less to translate, any good classic author.

67. Having considered the tenses which imply *present* and *past time*, it now remains that we examine the import of those which are expressive of *time future*. In Latin and English there are *two tenses* for this purpose; of which the *first* represents an action in point of time as *not yet existing*, but as about to exist at some period to come; but it does not bring the *completion* of the action into view. The *other* asserts the *futurity* of an action together with its *completion*. Scribam, “*I shall be writing*,” denotes *future time* and *incomplete action*; for it does not say whether I am to write for a long or for a short time, or whether I shall *finish* what I promise to *begin*. This part of the verb, therefore, to which the Greek γράβο corresponds, is an *imperfect future*, and likewise an *aorist*. The futurity of any action, it should seem, may always be computed from the time of speaking; for every action must be *future* with respect to the time at which its futurity is declared; but the time of its futurity may be more precisely specified by fixing on some *other future time* to which to refer it: “*I shall be writing after he shall have departed*.” *Shall* or *will* refers to *future time indefinitely*; and *write* or *writing* refers to an action which is indeed to *begin* and so far to proceed, but of which nothing is said concerning the completion.

On the other hand, *scripsero*, “*I shall have written*,” is a *perfect future* denoting complete action: for *shall* denotes *future time*; *written*, *finished action*; and *have*, *present possession*. So that the meaning of the whole assertion

is,

is, that "at some future period of time I shall possess the finished action of writing. The completion of the action, together with the possession of it, is always future with respect to the time of assertion; but, with respect to some other time expressed or understood, the completion of the action is to be past: *Promittis te scripturum si rogavero*—"you promise to write if I shall have asked you." In this sentence the action of asking is future with relation to the time of promising, but it is past with relation to that of writing. This tense the Latin grammarians call the future of the subjunctive mode; but very improperly. The notice which it communicates, respects not the power or liberty of acting, which, as will be seen by and by, is the characteristic of that mode; but the action itself. It ought therefore to be ranked among the tenses of the indicative mode; for *scripsero* is, in every sense, as really indicative as *scribam* or *scripturus ero*.

72
Of the
tenses of
the sub-
junctive
mode.

68. These are all the tenses, essentially different from each other, which have place in the indicative mode of any language with which we are acquainted (R); but as there are tenses in the mode called Subjunctive, which bear the same names with those already examined, and which have yet a different import, it will be necessary to consider them before we dismiss the subject of tenses.

Of modes in general something must be said hereafter; at present we shall only observe, that the mode with which we are now concerned, is not very properly distinguished by the name assigned to it by the Latin grammarians. They call it the subjunctive, because it is often subjoined to another verb, and forms the secondary clause of a sentence: but the mode called indicative frequently appears in the same circumstances. The difference between these two modes appears to us to consist in this, that the indicative asserts something directly concerning the action; the subjunctive, something concerning the power or liberty of the agent to perform it: for that the latter asserts as well as the former, admits not of dispute.

73
The pre-
sent.

69. The present tense of the subjunctive mode, in the learned languages, answers to the English auxiliaries *may* and *can*. Let us consider these a little.—*May* is evidently a verb of the present tense denoting liberty. When I assert that I *MAY* write, I give notice that "I am under no compulsion to abstain from writing;" that there is no impediment from without by which I am restrained from writing. *Can* is also a verb of the present

tense, expressive of internal power or skill. "I can write" is equivalent to—"There is nothing in myself which incapacitates me for performing the operation of writing." This verb seems originally to have denoted knowledge or skill, and to have been afterwards extended to signify power or ability of any kind. There is little doubt of its being the same with the old English verb *to con*, which signifies *to know*.—The difference between the import of these two verbs *may* and *can* will be best perceived in a familiar example. Suppose we say to one of our transcribers, "You may write a treatise on grammar," to which he returns for answer "I cannot:" our assertion evidently supposes him at liberty to write the treatise; his answer implies, that he is unable or unskilled to do it. We may conclude, then, that the present tense of this mode contains a declaration of present liberty, ability, or skill; and its other tenses will be found to have reference to the same capacities.

The observation is here to be repeated which was enlarged upon under the present of the indicative. The liberty or ability signified by this tense is always represented as present; but the time of this presence is indefinite. If no particular time be specified, we generally refer it to the time of speaking; but another point may be given from which we are to compute. "When he shall have finished, you may then proceed as you propose." Here the liberty of proceeding is stated as present, not at the time of speaking, but at the time of his finishing, which is future to the time of speaking. But though the liberty, ability, or skill, denoted by this tense, be represented as present, the action itself is stated as contingent; for it is not necessary that a man should perform an action because he has the capacity to perform it.

From this idea of the present of the subjunctive some of its most peculiar uses seem capable of being explained.—And, in the first place, it appears to have a near affinity with the future of the indicative; inasmuch that in many instances they may be used promiscuously. Without materially altering the effect of the expression, we may say, "*Dico me facturum esse quæ imperet*," or "*quæ imperabit*." The reason of this, perhaps, may be, that with respect to us, futurity and contingency are in most cases nearly the same, both being involved in equal obscurity; and therefore it is often of little consequence which mode of expression we employ.

Secondly, The present of the subjunctive is used to denote

(R) On this point we subscribe to the opinion of the elegant and ingenious Dr Beattie.—"It will perhaps occur (says he), that there are two Greek tenses, of which I have given no account; namely, the second aorist, and the second future. The truth is, that I consider them as unnecessary. Their place, for any thing I know to the contrary, might at all times be supplied by the first aorist and the first future. Some grammarians are of opinion, that the first aorist signifies time past in general, and the second, indefinite time past; and that the first future denotes a nearer, and the second a more remote futurity. But this, I apprehend, is mere conjecture, unsupported by proof: and therefore I incline rather to the sentiments of those who teach, that the second future and the second aorist have no meaning different from the first future and the first aorist; and that they are the present and imperfect of some obsolete theme of the verb, and, when the other theme came into use, happened to be retained for the sake of variety perhaps, or by accident, with a preterite and future signification. Be this as it will, as these tenses are peculiar to the Greek, and have nothing corresponding to them in other tongues, we need not scruple to overlook them as superfluous."—*The Theory of Language*, Part II. Chap. ii.

To these judicious observations we have nothing to add, but that they acquire no small degree of confirmation from this circumstance, that there are many Greek verbs which have no second future, and which are yet employed to denote every possible modification of future time. Of the paulo-post-futurum of the Greeks we have

note the *right* of which a person is possessed. "I may, or I can, sell this book." This application, which Dr Priestley considers as the *primary* signification of the tense, is easily deduced, or rather follows immediately, from the foregoing account of its import. For if one be under *no restraint*, either external or internal, to prevent him from performing an action, he has surely a *right* to perform it.

Thirdly, the *present* of the *subjunctive* is often used to signify *command* or *request*; as when one says, "You may give my compliments to such a person." This use of the tense under consideration seems to have arisen from a desire to *soften* the *harshness* of a command, by avoiding the appearance of claiming superiority. When a man utters the above sentence, he certainly utters *no command*, but only *asserts* that the person to whom he speaks has *liberty* or *power* to do him a favour. This assertion, however, may contain *no new information*; and therefore the person *addressed*, reflecting upon the *intention* of the *speaker* in making it, infers that it indicates a *wish* or *desire* that "his compliments should be made to such a person."

74. Of the *subjunctive* as well as of the *indicative*, the *præter-imperfect* is evidently the *past time* of the *present*. As the latter asserts *liberty*, or *ability*, to perform some action, as existing *at present*, the former asserts the same liberty or ability to *have existed* in *time past*; but the *precise portion* of time past, in which these capacities existed, must be specified by other words, or it will remain *unknown*. Thus in the following sentence, "Dixi me facturum esse quæ imperaret," the time of *imperaret* is referred to that of *dixi*: the person having the *right* to command, is supposed to have had it at the *time* when the other *said* that he would *obey*. This tense, as well as the *present*, states the action as *going on* and *incomplete*; and also as *future* with respect to the *liberty* or *ability* to perform it. It is rendered into *English* by the verbs *could* or *might*; of which the *first* is the *past time* of *can*, the *second* of *may*.

From the near affinity which the *present* of the *subjunctive* has to the *future* of the *indicative*, the tense now under consideration appears, in many instances, as the *past time* of the *latter* as well as the *former*. Thus *Dixi me facturum quæ imperaret*, may be rendered "I said that I would do whatever he might, or whatever he *should*, command."

75. Of the *præter-perfect*, it is sufficient to observe, that as the *present* states the agent as at *liberty* to be performing an *unfinished* action; so this tense states him as at liberty to perform an action considered as *finished*. "I may be writing a letter when you come, i. e. I am at liberty to be writing a letter when you come." I may have written a letter when you come," i. e. I am at liberty to be in possession of the *finished action* of writing a letter when you come."

It is a common mode of expression to say, "I may have done such or such a thing in my time," when he who speaks can have little doubt whether he has done the thing or not. In that case, the words *may have done*, cannot be considered as the *præter-perfect* of the

subjunctive of the verb *do*; for it is nonsense to talk of *liberty*, with respect to the *performance* of an action, which, at the time of speaking, is supposed to be *past* and *completed*. What then is the import of the phrase? We are persuaded that it is elliptical, and that the word *say* or *affirm* is understood: "I may (say that I) have done such or such a thing in my time;" for liberty or contingency can relate to actions only as they are conceived to be *present* or *future*.

76. Of all the tenses, the most complex is the *plufquam-perfect* of this mode. It combines a *past* and a *future* time with a *finished* action. It may be considered as the *past time* both of the *perfect future* and of the *præter-perfect* of the *subjunctive*: for it represents an action, *future* and *contingent* at some *past time*, as *finished before* another *period specified*; which period therefore, though *past* at the time of speaking, was itself *future* with respect to the time when the futurity or contingency of the action existed. "Promisit te scripturum fuisse si rogassent;" "You promised that you would write, if I should have asked you." Here the *futurity* of the action of *asking*, which is represented as *complete* and *finished*, is stated as *co-existing* with the *past promise*; but the action itself must be *posterior* to that promise: it is however supposed to be *past* with respect to the action of *writing*, which is also *posterior* to the promise.

77. Before we dismiss the subject of tenses, it may not be improper just to mention *number* and *person*; for these have place in every tense of the verb in the *learned* languages, and in many tenses even of the *English* verb. They cannot, however, be deemed *essential* to the verb; for *affirmation* is the same, whether it be made by *you*, by *me*, or by a *third person*, or whether it be made by *one man* or by a *thousand*. The most that can be said is, that verbs in the more elegant languages are provided with a variety of terminations which respect the *number* and *person* of every *substantive*, that we may know with more precision, in a complex sentence, each particular substance with its attendant verbal attributes. The same may be said of *sex* with respect to *adjectives*. They have terminations which *vary* as they respect beings *male* or *female*, though it is past dispute that *substances alone* are susceptible of *sex*. We therefore pass over these matters, and all of like kind, as being rather among the *elegancies* of *particular languages*, and therefore to be learned from the *particular grammar* of each tongue, than among the *essentials* of language; which *essentials alone* are the subject of inquiry in a treatise on *universal grammar*.

78. Besides *tenses*, *number*, and *person*, in every tongue with which we are acquainted, *verbs* are subject to another variation, which grammarians have agreed to call *Modes*. Of *modes*, as of *tenses*, it has been warmly disputed whether or not they be *essential* to language. The truth seems to be, that the only part of the verb *absolutely necessary* for the purpose of communicating thought is the *indicative mode*; for all the others, as has been well observed by Dr Gregory, are *resolvable*, by means of additional verbs and a word denoting the action of the primary verb, into circuitous expressions which

taken no notice, because it is found only in the *passive* voice; to which if it were necessary, it is obvious that it would be necessary in *all* voices, as a man may be about to *act* as well as to *suffer* immediately.

79
Different
opinions about the
number of
modes.

which fully convey their meaning (s). But such expressions continually repeated would make language very prolix and wholly inanimated; for which reason, the import of each of the commonly received modes is a subject worthy of the philologist's investigation. About the number of modes, whether necessary or only expedient, as well as about the import of each, the writers on grammar have differed in opinion. Mr Harris, one of the most celebrated of those writers, has enumerated four modes of the verb, besides the infinitive; viz. The INDICATIVE OR DECLARATIVE, to assert what we think certain; the POTENTIAL OR SUBJUNCTIVE, for the purposes of whatever we think contingent; the INTERROGATIVE, when we are doubtful, to procure us information; and the REQUISITIVE, to assist us in the gratification of our volitions. The requisitive too, according to him, appears under two distinct species; either as it is IMPERATIVE to inferiors, or PRECATIVE to superiors.

For establishing such a variety of modes as this, no sort of foundation whatever appears. The same reasoning which induced the author to give us an interrogative and requisitive mode; might have made him give us a hortative, a dissuasive, a volitive, and innumerable other modes, with which no language is acquainted. But besides perplexing his reader with useless distinctions, we cannot help thinking that Mr Harris has fallen into some mistakes with regard to the import of those modes which are universally acknowledged. According to him, *assertion* is the characteristic of the *indicative*, and that which distinguishes it from the *subjunctive* or *potential*: but this is certainly not true, for without an *assertion*, the verb cannot be used in any mode. Of this the learned author, indeed, seems to have been aware, when he observed of the *subjunctive* mode, that it is employed "when we do not *strictly* assert," and that "it implies but a *dubious* and *conjectural* assertion." The
N^o 142.

truth is, that the *assertion* implied in this mode, tho' it is not concerning the *same thing*, is equally *positive* and *absolute* with that conveyed by the *indicative*. An example quoted by himself should have set him right as to this matter:

*Sed tacitus pasci si possit corvus, HABERET
Plus dapis, &c.*

Who does not feel that the assertion contained in *haberet*, is as *absolute* and *positive* as any assertion whatever?

75. Perhaps we may be asked to define what we mean by a mode. We know not that we can define it to universal satisfaction. Thus much, however, seems to be obvious, that those variations which are called *modes* do not imply DIFFERENT MODIFICATIONS of the ACTION of the verb. *Amo, Amem, Ama*, do not signify *modes* of LOVING; for *modes* of loving are, loving MUCH, loving LITTLE, loving LONG, &c.—Shall we then get over the difficulty by saying, with Mr Harris, that "modes exhibit some way or other the *soul* and its *affections*?" This is certainly true: but it is nothing to the purpose; for it does not distinguish the meaning of *mode* from the object of language in general, all languages being intended to exhibit the *soul* and its *affections*.

Grammatical modes of verbs have been defined by ^{So} Mode de-
Dr Gregory to be "concise modes of expressing some of those combinations of thoughts which occur most frequently, and are most important and striking." This is a just observation; but perhaps he would have given a more complete definition had he said, that *grammatical modes of verbs are concise modes of expressing some of those combinations of thoughts which occur most frequently, and of which ASSERTION is an essential part* (τ). This indeed seems to be the real account of the matter, especially if our notion of the nature of verb be well founded,

(s) The *imperative*, for instance, may be resolved into a verb of commanding in the first person of the present of the *indicative*, and a word denoting the action of the primary verb, commonly called the *infinitive mode* of that verb. Thus, *I nunc et versus tecum meditare canoros*, and "*Jubeo te nunc ire et tecum meditari*," &c. are sentences of the very same import. The *subjunctive* may be resolved in the same manner by means of a verb denoting power or capacity; for *credam*, and *possum credere*, may be often used indifferently. The *indicative mode*, however, is not thus convertible with another verb of affirming in the first person of the present of the *indicative* and a word denoting the action of the primary verb; for *Titius scribit*, "*Titius writes*," is not of the same import with *dico Titium scribere, quod Titius scribat*, "*I say that Titius writes*." The first of these sentences, as has been already shown, contains but one assertion; the second obviously contains two. *Titius writes*, is equivalent to *Titius is writing*; *I say that Titius writes*, is equivalent to *I AM saying that Titius is writing*. The reason why the *imperative* and *subjunctive* are resolvable into expressions into which the *indicative* cannot be resolved, will be seen when the import of each of those modes is ascertained.

(τ) Every verb, except the simple verb *am, art, is, &c.* expresses without modes a combination of thoughts, viz. *affirmation* and an *attribute*. The affirmation, however, alone is essential to the verb, for the attribute may be expressed by other words. It is indeed extremely probable, that, in the earliest ages of the world, the affirmation and attribute were always expressed by different words; and that afterwards, for the sake of conciseness, one word, compounded perhaps of these two, was made to express both the affirmation and the attribute: hence arose the various classes of verbs, *active, passive, and neuter*. Of a process of this kind there are evident signs in the Greek and some other tongues. But the improvers of language stopped not here. The same love of conciseness induced them to modify the compound verb itself, that it might express various combinations of thought still more complex: but in all these combinations *assertion* was of necessity included; for if the word had ceased to assert, it would have ceased to be a verb of any kind.

Soon after this short note was written, and the whole article finished for the press, we accidentally met with *Pickbourn's Dissertation on the English Verb*. Of that work it belongs not to us to give a character. Such of our readers as shall peruse it, will see that on many points we differ widely in opinion from the author; but we have no painful apprehension of any comparison which may be made. It gives us pleasure, however, to find, that

founded,—that its *essence* consists in *affirmation*. And in this opinion we are the more confirmed, from a conviction that no man *ever* employs language on *any occasion* but for the purpose of *affirming something*. The speaker may affirm something directly of the *action itself*; something of the agent's *power* or *capacity* to perform it; or something of his own *desire* that it should be performed, &c.—but still he must *affirm*.

81.
All modes
equally in-
dicative.

If this be so, then are all the modes equally *indicative*. Some may be indicative of *perceptions*, and others of *volitions*; but still they all contain *indications*. On this idea the three foregoing modes of *amo* will be thus distinguished. When a man indicates his *present feeling* of the passion of love, he uses the first; when he indicates his *present capacity* of feeling it, he uses the *second*; and when he indicates his *present desire* that the person to whom he is speaking would entertain that passion, he uses the *third*.

76. As to what Mr Harris calls the *interrogative* mode, he himself observes that it has a near affinity to the *indicative*. It has in fact not only a near *affinity* to it, but, as far as language is concerned, there is not between the one and the other the slightest difference. For, in *written* language, take away the *mark of interrogation*, and, in *spoken* language, the *peculiar tone of voice*, and the *interrogative* and *indicative* modes appear *precisely the same*. That such should be the case is extremely natural.

To illustrate this, let us for once speak in the first.
VOL. VIII. Part I.

gular number, and conceive one of our readers to be present. I *assert* a thing, taking the *truth* of it for granted; but if you know me to be *wrong*, I *presume* that you will set me *right*: in this case, assertion produces the same effect as *interrogation*. Instances perpetually occur in common conversation. An acquaintance says to me—"You took a ride this morning:" I answer *yes* or *no* according to the case; and the same effect is produced as if he had said—"Did you take a ride this morning?" In this way, at first, would simple *assertions* be employed to procure information wanted. *Fecisti*—you *did* such a thing; *fecisti ne*—you *did it not*:—either would produce the proper reply, and the information wanted would be gained (u). This being observed as language improved, men would accompany such a sentence with a *peculiar tone of voice*, or other marks, to signify more unequivocally that they wanted *information*, or that *such information* was the *only object* of their speech. Farther progress in refinement would lead them to alter the *position of the words* of a sentence when they meant to *ask a question*, as we do in *English*, saying (when we *assert*), "*You have read Euripides*;" (when we *interrogate*), "*Have you read Euripides*?"

In *Greek* and *Latin*, questions are asked commonly enough by the particles *an* and *an*. These particles we know to be exactly equivalent to the English particle *if*, at least to the sense in which that particle is commonly taken. *An fecisti* is "*If you did it*;" and the sentence
I
tence

that his notions respecting the origin of such verbs as express at once *assertion* and an *attribute*, are the same with those which had occurred to ourselves.

"The copula *is* appears (says Mr Pickbourn) to have been coeval with language itself. But we have not the same evidence to convince us, that that must necessarily have been the case of any other finite verb; for the copula *is*, containing only an *affirmation*, is much more simple than a verb which unites in one word both an attribute and an affirmation. Since therefore people, in their first attempts to express their ideas by words, would scarcely think of any thing more than what was absolutely necessary, it is probable they would be some time before they invented any other word containing in itself an *assertion* or *affirmation*; for they would not very early think of contriving words so *complex* in their nature as to include in them both the *name* of an *action* and an *assertion*.

"I conjecture, that the first mode of expressing *actions* or *passions* would be by *participles* or *verbal nouns*, *i. e.* words signifying the *names* of the *actions* or *passions* they wanted to describe; and these words, connected with their subject by the copula *is*, might in those rude beginnings of language tolerably well supply the place of verbs: *e. g.* from observing the operations of nature, such words as *rain* or *raining*, *thunder* or *thundering*, would soon be invented; and by adding the copula *is*, they would say, *thundering* or *thunder is* or *is not*, *raining* or *rain is*; which, by the rapidity of pronunciation, might in time form the verbs *rains*, *thunders*, &c. The observation of their own *actions*, or the *actions* of the animals around them, would soon increase their stock of ideas, and put them upon contriving suitable expressions for them. Hence might arise such words as these; *sleep* or *sleeping*, *stand* or *standing*, *run* or *running*, *bite* or *biting*, *hurt* or *hurting*: and by joining these to substantives by means of the copula *is*, they might form such sentences as these,—*Lion is sleeping*, or perhaps *lion sleep is*, *stand is*, &c. which would soon be contracted into *lion sleeps*, *stands*, *runs*, *bites*, *hurts*, &c. Thus our little insulated family might become possessed of verbs including an *attribute* and an *affirmation* in one word."

This account of the origin of *active*, *passive*, and *neuter verbs*, is certainly ingenious; and, in our opinion, it is not more ingenious than just when applied to the Greek and other ancient languages, though it is not applicable to the English: but it seems to be quite irreconcilable with the definition of *verb*, which the author has adopted from Bishop Lowth; and indeed with every other definition except that which makes the *essence* of *verb* to consist in *simple affirmation*.

(u) Of a question put in the form of an assertion we have a remarkable instance in the Gospel of St Matthew. When Christ stood before Pilate, the governor asked him, saying, *Συ ει ο βασιλευς των Ιουδαιων*. That his sentence was pronounced with a view to obtain some answer, is evident from the context; yet it is as plainly an *affirmation*, though uttered probably in a scoffing tone, as the serious confession of Nathaniel, *Συ ει ο βασιλευς του Ισραηλ*. Had not the question been put in this form, which *asserts* Christ to be the king of the Jews, the reply could not have been *Συ λεγεις*; for without an *assertion* the governor would have said nothing. See Dr Campbell's *Translation of the Gospels*, where the form used in the original is with great propriety retained in the version.

tence may either be an abbreviation for *dic an fecisti*, "tell me if you did it;" or *an* may perhaps be, as *if* certainly is, the imperative mode of some obsolete verb equivalent to *give*; and in that case, *an fecisti* will be a complete interrogative sentence, signifying, "you did it, *give that*."—But of the *interrogative mode* of Mr Harris we have said enough; perhaps, our readers will think, too much, since it is a useless distinction not found in any language. It will, however, be proper to say something of his *precativè mode*, as far as it is the same with the *optative mode* of the Greek grammarians. And,

82
Of the optative mode.

77. Nothing, we think, can be clearer, than that the Greek *optative* constitutes *no distinct mode* of the verb, whatever meaning be annexed to the word *mode*. The different tenses of the *optative* are evidently nothing but the *past times* of the *corresponding tenses* of the *subjunctive*. Præf. sub. τυπῶ, I may strike. Præf. opt. τυπώμι, I might strike, &c. This is proved to be indubitably the case by the uniform practice of the Greek writers. Examples might be found without number were one to read in search of them. The following sentence will illustrate our meaning: Ἐρχονται Ἀθηναῖοι ἵνα βοηθῶσι τοῖς Ἀργείοις, "the Athenians come that they may assist the Argives." Here the leading verb ἔρχονται being of the *present tense*, the dependent verb βοηθῶσι is the *present subjunctive*. But change the former to the *past time*, and the latter must also be changed. Ἦρχοντο Ἀθηναῖοι ἵνα βοηθοῦεν τοῖς Ἀργείοις, "the Athenians came that they might assist the Argives." Here it is plain that βοηθοῦεν, the present of the *optative*, is the *past time* of βοηθῶσι, the present of the *subjunctive*; and the same in other instances.

It is almost unnecessary to add, that when *this mode* is employed to denote a *wish*, the wish is not *expressed* by the verb, but is *understood*. Such abbreviated expressions to denote a wish are common in all languages. Thus, in Greek,

Τμιν μὲν θεοὶ δοῖεν, ὀλυμπία δοματ' ἔχοντες
Ἐκτερσαι Πριαμοῖο πόλιν, &c.

signifies, "The gods might give you (or, as we say in English, *changing* the position of the verb, *might the gods give you*) to destroy," &c. So in Latin, *Ut te omnes dii deaque perdant*, "That all the gods and goddesses may curse you!" Again, in English, "O that my head were waters!" &c. In all these, and such like sentences, the words equivalent to *I wish*, *I pray*, are understood. In Greek a *wish* is sometimes introduced by the particle *ἵ* or *ἵνα*, *if*; as in Homer,

Εἰθ' ὄριες τ' ἀγῶνος τ' ἔμειναι, ἀγομὸς τ' ἀπολίσθαι.

"If it had been your fate not to be born, or to die unmarried!" The supplement is, "It would have been happy for your country," or some such thing. In like manner, a poor person not uncommonly intreats a favour by saying, "Sir, *if* you would be so good!" Here he *stops*; but the completion of his sentence is, "It would make me happy." In all these cases a *wish*

is not *formally expressed* by the speaker, but *inferred* by the hearer. They are therefore instances of that tendency which mankind universally discover to abbreviate their language, especially in cases where the passions or feelings are interested.

78. The *interrogative* and *optative modes* being set aside as superfluous, it would appear from our investigation, that the *real distinct modes* of the verb, which are found in the most copious and varied language, are only *three*; the *indicative*, the *subjunctive*, and the *imperative*: and that these are all that can be considered as *necessary*; the *first* to indicate the speaker's *feeling* or *acting*, the *second* to indicate his *capacity* of feeling or acting, and the *third* to indicate his *desire* that the person to whom he speaks *should feel* or *act*. 83
Only three modes necessary, the indicative, subjunctive, and imperative.

Here again we have the misfortune to find ourselves differ in opinion with Dr Gregory; who seems to think, that a greater number of modes, if not absolutely necessary, would, however, be highly useful. His words are: "All languages, I believe, are defective in respect of that variety and accuracy of combination and of distinction, which we know with infallible certainty take place in thought. Nor do I know of any particular in which language is more deficient than in the expressing of those *energies* or modifications of thought; some of which always are, and all of which might be, expressed by the grammatical moods of verbs. Of this there cannot be a clearer proof than the well-known fact, that we are obliged to express by the same mood very different modifications or *energies* of thought. As, for instance, in the case of the grammatical mood called the *imperative*, by which we express occasionally prayer to God, command to a slave, request to a superior, advice to an equal or to any one, order as from an officer to his subaltern, supplication to one whom we cannot resist."—If these be, as the author calls them, *specific* differences of thought, he will not surely object to their being all ranked under one *genus*, which may be called *desire* (x). That the internal feelings, which prompt us to pray to God, to command a slave, to request a superior, to advise an equal, to give an order to an inferior, and to supplicate one whom we cannot resist, are all different in *degree*, cannot be denied. Each of them, however, is *desire*; and the *predication*, by which the desire is made known to the person whom we address, is the same in all, when we utter a prayer as when we utter a command, when we request as when we supplicate. But *predication alone* is that which constitutes the *verb*: for *desire* by itself, however modified, can be expressed only by an *abstract noun*; and the *mere energy* of desire, when not applied to a particular *energiser*, can be expressed only by a *participle*, or by what is commonly, though improperly, called the *infinitive mode*. Now it is certainly conceivable, that a few *shades of meaning*, or a few (y) *degrees* of one *general energy*, might be marked by

(x) "DESIRE;—wish; with eagerness to obtain or enjoy." Johnson.

"The uneasiness a man finds in himself upon the absence of any thing, whose present enjoyment carries the idea of delight with it, is that we call DESIRE. Good and evil, present and absent, work upon the mind; but that which immediately determines the will, from time to time, to every voluntary action, is the uneasiness of DESIRE, fixed upon some absent good." Locke.

This, whether it be sound philosophy or not, is surely sufficient authority for using the word *desire* to denote the *genus*; of which *prayer, command, advice, supplication, &c.* may be considered as so many distinct *species*.

(y) Dr Gregory seems to think, that not barely a few, but a vast number, of these *energies* might be so marked.

"Affirming

by *corresponding variations* of such verbs as combine energy with *predication*; and there could be no great impropriety in calling those variations *modes*, or rather *modes of modes*: but that such a *multiplication* of modes would be an improvement in language, is by no means evident. The verb, with the modes and tenses which it has in all languages, is already a very complex part of speech; which few are able, and still fewer inclined, to analyze: and it would surely be of no advantage to make it more complex by the introduction of *new modes*, especially when those *degrees of energy* which could be marked by them are with equal and perhaps greater precision marked, in the *living speech*, by the different tones of voice adapted to them by nature; and, in *written language*, by the reader's general knowledge of the subject, and of the persons who may be occasionally introduced. If there be any particular delicacy of sentiment, or energy, which cannot thus be made known, it is better to express it by a name appropriated to itself, together with the *simple* and original verb of affirmation, than to clog the *compound* verb with such a multiplicity of variations as would render the acquisition of every language as difficult as is said to be that of the Chinese written characters. The *indicative*, *subjunctive*, and *imperative*, are there-

fore all the modes of the verb which to us appear to be in any degree *necessary* or expedient; and they are in fact all the modes that are really found in any language with which we are acquainted.

For the *INFINITIVE*, as has been already observed, ⁸⁴ seems on every account to be improperly styled a ^{The infinitive no mode of the verb, but an abstract noun.} *mode*. To that name it has no title which we can perceive, except that its *termination* sometimes (for even this is not true universally) differs in the learned languages from the terminations of the *other parts* of the verb. Nay, if *affirmation* be, as it has been proved to be, the very *essence* of verb, it will follow, that the *infinitive* is no part of the verb at all; for it expresses *no affirmation*. It forms no complete sentence by *itself*, nor even when *joined to a noun*, unless it be aided by some *real part* of a verb either expressed or understood. *Scribo, scribebam, scripsi, scripseram, scribam, scripsero*; "I am writing, I was writing, I have written, I had written, I shall write, I shall have written," do each of them contain an *affirmation*, and constitute a complete sentence: but *scribere* "to write," *scripsisse* "to have written," affirm nothing, and are not more applicable to any one person than to another. In a word, the *infinitive* is nothing more than an *abstract noun* (2), denoting the *simple ENERGY* of the verb, in conjunction

I 2

with

"¹ *Affirming* (says he), ² *denying*, ¹ *testifying*, ³ *foretelling*, ³ *asking*, ³ *answering*, ³ *wisbing*, ³ *hoping*, ³ *expecting*, ³ *believing*, ³ *knowing*, ³ *doubting*, ³ *supposing*, ³ *stipulating*, ³ *being able*, ³ *commanding*, ³ *praying*, ³ *requesting*, ³ *supplicating*, ³ *loving*, ⁴ *hating*, ⁴ *fearing*, ⁴ *despairing*, ⁴ *being accustomed*, ⁴ *wondering*, ⁴ *admiring*, ⁴ *wavering*, ⁴ *swearing*, ⁴ *advising*, ² *refusing*, ⁵ *exhorting*, ⁴ *dissuading*, ⁵ *encouraging*, ⁵ *promising*, ⁵ *threatening*, &c. all admit very readily of being combined with the general import of a verb." He adds, that "if every one of them had been expressed in all languages by variations as striking as those of *τυπῶ, τυπῶμαι, and τυπῆ*, they *must* have been acknowledged as distinct *moods* of the verb."

If all these words denote different energies of thought, which, however, may be doubted, and if all those different energies, with many others for which, as the author justly observes, it is not easy to find names, could, like *capacity* and *desire*, be combined with the *general action* or *energy* of *one verb*; and if those *combinations* could be marked by *corresponding variations* of that verb; we should indeed acknowledge such *variations* to be distinct *modes*, or *modes of modes*, of the verb. But we doubt much if all this be possible. We are certain that it would be no improvement: for it seems to be evident, either that, in some of the modes, the radical letters of the original verb must be changed, and then it would cease to be the same verb; or that many of the modes must be expressed by words of very unmanageable length; not to mention that the additional complication introduced by so many minute distinctions into a part of speech already exceedingly complex, would render the import of the verb absolutely unintelligible to nine-tenths even of those who are justly styled *the learned*.

(2) In our idea of the *infinitive*, we have the honour to agree with the learned and excellent *Ruddiman*; whose words are, "Non inepte hic modus a veteribus quibusdam VERBI NOMEN est appellatum. Est enim (si non verè ac semper, quod nonnulli volunt, nomen substantivum) significatione certè ei maximè affinis; ejusque vices sustinet per omnes casus. Et quidem manifestè substantivum videtur, cum adjectivum ei additur neutri generis: ut, *Cic. Att. xiii. 28. Cum vivere ipsum turpe sit nobis.*—*Pers. v. 53. Velle suum cuique est.*—*Cic. Fin. i. 1. Totum hoc displicet philosophari.*—*Petron. c. 52. Meum intelligere nullà pecunia vendo.* Item, *absque adjectivo*: ut, *Ovid Met. ii. 483. Possè loqui eripitur, i. e. potestas loquendi.*—*Plaut. Bacch. i. 2. 50. Hic vereri perdidit, i. e. verecundiam.*—*Cic. Tulc. v. 38. Loquor de docto homine et erudito, cui vivere est cogitare, i. e. cujus vita est cogitatio.* [GRAMMATICÆ LATINÆ INSTITUTIONES: Pars secunda, lib. i. cap. 2. where the reader will find examples of the *infinitive* used by the best Roman writers as a substantive noun in every case.]

This opinion of *Ruddiman* and his ancient grammarians has been lately controverted with much ingenuity by *Dr Gregory*; who seems to think, that in the *infinitive* alone we should look for the *essence* of the verb divested of every accidental circumstance, time only excepted. If this be indeed the case, almost every thing which we have said of the verb, its *tenses*, and its *modes*, is erroneous; and he who takes his principles of grammar from the *Encyclopædia*, will fill his head with a farrago of absurdities. The writer of the article, however, has been at much pains to acquire correct notions of the subject: he has studied the writings of others; he

has

with time; and is not a *mode*, as far as we can conceive, of any thing. Thus, *Scire tuum nihil est*, is the same with *Scientia tua nihil est*; and, "Death is certain," with "To die is certain."

85
Of expressing commands by the future tense.

79. Before we dismiss the subject of *modes*, it may not be improper to take notice of the connection which Mr Harris, after Apollonius, has found between *commanding* and *futurity*. "Intreating and commanding (he says) have a necessary respect to the *future only*. For what have they to do with the *present* and the *past*, the natures of which are immutable and necessary." This is surely confounding *commands* with the *execution* of commands. But the learned writer proceeds to inform us, that "it is from the *connection* of *futurity* with *commands*, that the *future* of the *indicative* is sometimes used for the *imperative mode*." The *connection*, of which he speaks, appears to us entirely imaginary; for *futurity* has nothing to do with *commands*, though it may

with the *execution* of them. The *present time* is the time of *commanding*, the future of *obeying*. But supposing the connection *real*, it would not account for the *future tenses* being used *imperatively*. For although it were true, as it is evidently false, that commands are *future*, it would not follow that the relation is *convertible*, or that employing the *future* should imply a *command*. The principle upon which such expressions as, THOU SHALT NOT KILL, come to have the force of a *command*, seems to be this. When a person, especially one possessed of authority, asserts that an *action*, depending on the *will* of a *free agent*, and therefore in its own nature *contingent*, *shall* or *shall not* actually take place; what are we to *conclude* from such an assertion? Why surely it is natural to conclude, that it is his *will*, his *command*, that his assertion be *verified*. The English word *shall*, if we be well informed, denoted originally *obligation*; a sense in which its past tense *should* is still

has consulted several persons of undoubted learning, who have devoted a great part of their time to grammatical investigations; and he is extremely unwilling to suppose, that all his inquiries respecting the most important part of speech have ended in error. He trusts, therefore, that he shall not be deemed a petulant caviller, though he examine with some severity the principal observations and arguments upon which the Doctor has built his theory. Upon that examination he enters with diffidence: for the learned Professor's knowledge of the various powers of the mind appears, even in this essay, to be such as eminently qualifies him for ascertaining the precise import of every species of words employed for the purpose of communicating thought; and with such a man the present writer would be much happier to agree than to differ in opinion.

The Doctor acknowledges (Transact. of the Royal Society, Edinburgh, Vol. II. lit. class, p. 195), that the *infinitive* is most improperly called a *mode*: and on that account he thinks we ought to turn our thoughts *exclusively* to it, "when we endeavour to investigate the general import of the verb, with a view to ascertain the *accident* which it denotes; and be led, step by step, to form a distinct notion of what is *common* in the *accidents* of all verbs, and what is *peculiar* in the *accidents* of the several classes of them, and thereby be enabled to give good definitions, specifying the *essence* of the verb," &c. It may be true, that to the *infinitive exclusively* we should turn our attention, when we wish to ascertain the *accident* denoted by a *particular verb* or class of verbs; i. e. the *kind of action, passion, or state of being*, of which, superadded to affirmation, that verb or class of verbs is expressive: but in *accidents* of this kind it may be doubted if there be any thing that with propriety can be said to be *common* to all verbs. There seems indeed to be nothing *common* to all verbs but that which is *essential* to them, and by which they are distinguished from every other part of speech; but every kind of *action, passion, and state of being*, may be completely expressed by *participles* and *abstract nouns*; and therefore in such *accidents* we cannot find the *essence* of the verb, because such accidents distinguish it not from other parts of speech. Were a man called upon to specify the *essence* of *verse* or *metre*, he would not say, that it consists in the meaning of the words, or in the using of these words according to the rules of syntax. In every kind of verse where words are used they have indeed a meaning, and in all good verses they are grammatically constructed; but this is likewise the case in *prose*, and therefore it cannot be the *essence* of *verse*. The *essence* of *verse* must consist in something which is not to be found in *prose*, viz. a certain harmonic succession of sounds and number of syllables: and the *essence* of the *verb* must likewise consist in something which is not to be found in any other part of speech; and that, we are persuaded, is nothing but *affirmation*. But if *affirmation* be the very *essence* of the verb, it would surely be improper, when we endeavour to ascertain the general import of that part of speech, to turn our thoughts exclusively to a word which implies *no* affirmation; for what does not affirm, cannot in strictness of truth be either a *verb* or the *mode* of a verb.

In the same page it is said, that "the *infinitive* denotes that kind of thought or combination of thoughts which is common to all the other modes." In what sense this is true, we are unable to conceive: it denotes indeed the same *accident*, but certainly not the same *thought* or *combination* of thoughts. In the examples quoted, *Non est VIVERE sed VALERE vita*, &c. the infinitives have evidently the effect of *abstract nouns*, and not of *verbs*; for though *vivere* and *valere* express the same *states of being* with *vivo* and *valeo*, they by no means express the same *combination of thoughts*. *VIVO* and *VALEO* affirm that *I AM* living, and that *I AM* well; and he who utters these words must think not of *life* and *health* in the *abstract*, but of *life* and *health* as *belonging to himself*. *VIVERE* and *VALERE*, on the other hand, affirm nothing; and he who utters them thinks only of the *states of living* and of *being in health*, without applying them to any particular person.

The exquisitely learned author of *The Origin and Progress of Language*, having said that the *infinitive* is used either as a *noun*, or that it serves to connect the verb with another verb or a noun, and so is useful in syntax, the Doctor combats this opinion, and infers the infinitive to be truly a *verb*; because "the thought expressed by

still commonly employed. In English, therefore, the foregoing process of inferring a command from an assertion of futurity, seems to have been reversed; and the word *shall*, from denoting a command or obligation, has come to denote futurity simply.

86

Of verbs, as they are active, passive, or neuter.

80. Having considered the verb in its essence, its tenses, and its modes, we might seem to have exhausted the subject; but there is still something more to be done. Grammarians have distinguished verbs into several species; and it remains with us to inquire upon what principle in nature this distinction is made, and how far it proceeds. Now it must be obvious, that if predication be the essence of verb, all verbs, as such, must be of the same species; for predication is the same in every proposition, under every possible circumstance, and by whomsoever it is made. But the greater part of verbs contain the predicate as well as the predication of a pro-

4

position; or, to speak in common language, they denote an attribute as well as an affirmation. Thus, *lego* is "I am reading;" *ambulo*, "I am walking;" *sto*, "I am standing;" *verbero*, "I am striking;" *verberor*, "I am stricken." But the attributes expressed by these verbs are evidently of different kinds; some consisting in action, some in suffering, and some in a state of being which is neither active nor passive. Hence the distinction of verbs, according to the attributes which they denote, into active, passive, and neuter. *Lego*, which is an assertion that I am employed in the act of reading, is an active verb; *verberor*, which is an assertion that I am suffering under the rod, is a passive verb, because it denotes a passion; and *sto*, which is an assertion that I am standing still, is said to be a neuter verb, because it denotes neither action nor passion. But it is self-evident that there cannot be action without an agent, nor passion without

by means of it, may be expressed in synonymous and convertible phrases, in different languages, by means of other parts or moods of the verb." Of these synonymous and convertible phrases he gives several examples, of which the first is taken from Hamlet's soliloquy. "To be or not to be, that is the question," he thinks equivalent in meaning to, "The question is, whether we shall be or shall not be?" But we are persuaded he is mistaken. "Whether we shall be or shall not be," is a question asking, whether we shall exist at some future and indefinite time? but the subject of Hamlet's debate with himself was not, Whether, if his conscious existence should be interrupted, it would be afterwards at some future and indefinite time restored? but whether it was to continue uninterrupted by his exit from this world? This, we think, must be self-evident to every reader of the Soliloquy. It is likewise very obvious, that the word *question* in this sentence does not signify interrogatory, but subject of debate or affair to be examined; and that the word *that* serves for no other purpose than to complete the verse, and give additional emphasis, perhaps, to an inquiry so important. "To be or not to be, that is the question," is therefore equivalent in all respects to "The continuance or non-continuance of my existence, is the matter to be examined;" and the infinitive is here indisputably used as an abstract noun in the nominative case. Should it be said, that the Doctor may have taken the sentence by itself, unconnected with the subject of Hamlet's soliloquy; we beg leave to reply that the supposition is impossible; for, independent of the circumstances with which they are connected, the words "To be or not to be" have no perfect meaning. Were it not for the subject of the soliloquy, from which every reader supplies what is wanting to complete the sense, it might be asked, "To be or not to be—What? A coward, a murderer, a king, or a dead man! Questions all equally reasonable, and which in that case could not be answered.

With the same view, to prove the infinitive to be truly a verb, the Doctor proceeds to remark upon the following phrases, *Dico, credo, puto, Titium existere, valere, jacere, cecidisse, procubuisse, projecisse Mævium, projectum fuisse a Mævio*; which, he says, have the very same meaning with *dico, &c. quod Titius existat, quod jaceat, quod ceciderit, &c.* He adds, that "the infinitives, as thus used, acquire not any further meaning, in addition to the radical import of the verb with tense, like the proper moods; but the subjunctives after *quod* lose their peculiar meaning as moods, and signify no more than bare infinitives." In the sense in which this observation is made by the author, the very reverse of it seems to be the truth. The infinitives, as thus used, acquire, at least in the mind of the reader, something like the power of affirmation, which they certainly have not when standing by themselves; whereas, the subjunctives neither lose nor acquire any meaning by being placed after *quod*. *Dico, credo, puto, Titium existere, valere, jacere, &c.* when translated literally, signify, *I say, believe, think, Titius to exist, to be well, to lie along*; a mode of speaking which, though now not elegant, was common with the best writers in the days of Shakespeare, and is frequently to be found in the writings of Warburton at the present day. *Dico, credo, puto, quod Titius existat, quod jaceat, &c.* signifies literally, *I say, believe, think, that Titius may exist, may lie along, &c.* Remove the verbs in the indicative mode from the former set of phrases, and it will be found that the infinitives had acquired a meaning, when conjoined with them, which they have not when left by themselves; for *Titium existere, jacere*; "Titius to exist, to lie along," have no complete meaning, because they affirm nothing. On the other hand, when the indicative verbs are removed, together with the wonder-working *quod*, from the latter set of phrases, the meaning of the subjunctives remains in all respects as it was before the removal; for *Titius existat, jaceat, &c.* signify, *Titius may exist, may lie along*, as well when they stand by themselves as when they make the final clauses of a compound sentence. Every one knows, that *quod*, though often called a conjunction, is always in fact the relative pronoun. *Dico, credo, puto, quod Titius existat*, must therefore be construed thus: *Titius existat (est id) quod dico, credo, &c.* "Titius may exist is that thing, that proposition, which I say, believe, think." In the former set of phrases, the infinitives are used as abstract nouns in the accusative case, denoting, in conjunction with *Titium*, one complex conception, the existence, &c. of Titius: *Dico, credo, puto*; "I say, believe, think;" and the object of my speech, belief, thought, is, *Titium existere*, "the existence of Titius."

In

87
All verbs
have a ne-
cessary re-
ference to a
noun in the
nominative
case.

without a *passive being*; neither can we make a *predication of any kind*, though it denote neither *action* nor *passion*, without predicating of *something*. All verbs, therefore, whether *active*, *passive*, or *neuter*, have a necessary reference to some *noun* expressive of the *substance*, of which the *attribute*, denoted by the verb, is *predicated*. This noun, which in all languages must be in the *nominative case*, is said to be the *nominative* to the *verb*; and in those languages in which the *verb* has *person* and *number*, it must in *these respects* agree with its *nominative*.

88
Active
verbs trans-
itive or in-
transitive.

Of *action*, and consequently of *verbs denoting action*, there are obviously two kinds. There is an *action* which passes from the *agent* to some *subject*, upon which he is employed; and there is an *action* which respects *no object* beyond the *agent himself*. Thus *lego* and *ambulo* are verbs which equally denote *action*; but the action of *lego* refers to some *external object* as well as to the *agent*; for when a man is *reading*, he must be reading *something*, a book, a newspaper, or a letter, &c. whereas, the action of *ambulo* is confined wholly to the *agent*; for when a man is *walking*, he is employed upon nothing *beyond himself*,—his *action* produces no *effect* upon any thing external. These two species of verbs have been denominated *transitive* and *intransitive*; a designation extremely proper, as the distinction which gave rise to it is philosophically just. *Verbs* of both species are *active*;

but the action of those only which are called *transitive*, respects an external object; and therefore, in those languages of which the nouns have cases, it is only after verbs which are *transitive* as well as *active*, that the noun denoting the *subject* of the action is put in the *accusative* or *objective case*. Verbs which are *intransitive*, though they be really *active*, are in the structure of sentences considered as *neuter*, and govern *no case*.

And so much for that most important of all words the *verb*. We proceed now to the consideration of *participles*, *adjectives*, and *adverbs*; which, as they have a near relation to one another, we shall treat of in the same chapter.

CHAPTER V.

Of PARTICIPLES, ADJECTIVES, and AD- VERBS.

SECT. I. Of PARTICIPLES.

81. THE nature of *verbs* being understood, that of *participles* is not of difficult comprehension. Every verb, except that which is called the *substantive verb*, is expressive of an *attribute*, of *time*, and of an *assertion*. Now if we take away the *assertion*, and thus destroy the *verb*, there will remain the *attribute* and the *time*; and these combined make the essence of that species of words called

In confirmation of the same idea, that the *infinitive* is truly a *verb*, the author quotes from *Horace* a passage, which, had we thought quotations necessary, we should have urged in support of our own opinion:

—Nec quicquam tibi prodest
Aërias TENTASSE domos, animoque rotundum
PERCURRISSE polum, morituro.

To our apprehension, nothing can be clearer than that *TENTASSE* and *PERCURRISSE* are here used as *nouns*; for if they be not, where shall we find a *nominative* to the verb *prodest*? It was certainly what is signified by *TENTASSE aërias domos, animoque rotundum PERCURRISSE polum*, that is said to have been of no advantage to *Archytas* at his death. This indeed, if there could be any doubt about it, would be made evident by the two prose versions, which the professor subjoins to these beautiful lines. The first of which is as follows: *Nec quicquam tibi prodest quod aërias domos TENTAVERIS, et animo PERCURRERIS polum*; which must be thus construed: *TENTAVERIS aërias domos, et PERCURRERIS animo polum (est id) quod nec quicquam tibi prodest*. This version, however, is not perfectly accurate; for it contains *two propositions*, while *Horace's* lines contain but *one*. The second, which though it may be a crabbed inelegant sentence, expresses the poet's sense with more precision, is in these words: *Nec quicquam tibi prodest morituro tua TENTATIO domuum aëriarum, et CURSUS tuus circa polum*. Having observed, with truth, that this sentence has the very same meaning with the lines of *Horace*, *Dr Gregory* asks, "Why are not *tentatio* and *cursus* reckoned verbs as well as *tentasse* and *percurrisse*?" Let those answer this question who believe that any of these words are truly verbs; for they are surely, as he adds, all very near akin; indeed so near, that the mind, when contemplating the import of each, cannot perceive the difference. Mean while, we beg leave in our turn to ask, Why are not *tentasse* and *percurrisse* reckoned *abstract nouns* as well as *tentatio* and *cursus*? To this question it is not easy to conceive what answer can be returned upon the Doctor's principles. In his theory there is nothing satisfactory; and what has not been done by himself, we expect not from his followers. On the other hand, our principles furnish a very obvious reason for excluding *tentatio* and *cursus* from the class of *verbs*; it is, because these words express no *predication*. *Tentasse* and *percurrisse* indeed denote *predication* no more than *tentatio* and *cursus*; and therefore upon the same principle we exclude them likewise from a class to which, if words are to be arranged according to their import, they certainly do not belong.

Should the reader be inclined to think that we have dwelt too long on this point, we beg him to reflect, that if our ideas of the essence of the verb and of the nature of the infinitive be erroneous, every thing which we have said of modes and tenses is erroneous likewise. We were therefore willing to try the solidity of those principles which hold the essence of the verb to consist in *energy*: and we selected *Dr Gregory's* theory for the subject of examination, not from any disrespect to the author, whom the writer of this article never saw; but because we believe his abilities to be such, that

—Si Pergama dextra
Defendi possent, etiam hac defensa fuissent.

89
The former only govern nouns in the accusative case.

90
Participles denote an attribute combined with time.

ed PARTICIPLES. Thus, take away the *assertion* from the verb *γραφει* *writeth*, and there remains the *participle* *γραφων* *writing*; which, without the *assertion*, denotes the same attribute and the same time. After the same manner, by withdrawing the *assertion*, we discover *γραφας* *written* in *γραφει* *wrote*; *γραφων* *about to write* in *γραφει* *shall be writing*. This is Mr Harris's doctrine respecting *participles*; which, in our opinion, is equally elegant, perspicuous, and just. It has, however, been controverted by an author, whose rank in the republic of letters is such, that we should be wanting in respect to him, and in duty to our readers, were we to pass his objections wholly unnoticed.

82. It is acknowledged by Dr Beattie, that this, which we have taken, is the most convenient light in which the *participle* can be considered in universal grammar: and yet he affirms that *present participles* do not always express *present time*, nor *preterite participles* *past time*; nay, that *participles* have often no connection with time at all. He thus exemplifies his assertion, in Greek, in Latin, and in English.

"When Cebes says, *Ετυχατομεν περιπατουσιν εν τω του χρονου ιερω*, 'We WERE WALKING in the temple of Saturn,' the particle of the present WALKING, is, by means of the verb WERE, applied to time *past*; and therefore of itself cannot be understood to signify any sort of time." Again, after observing, that in English we have but two simple participles, such as *writing* and *written*, of which the former is generally considered as the *present* and the latter as the *past*, the Doctor adds, But "the *participle* *writing*, joined to a verb of different tenses, may denote either *past* or *future* action; for we may say not only, *I AM writing*, but also, *I WAS writing* yesterday, and *I SHALL BE writing* to-morrow;" whence he infers that *no time whatever* is denoted by the present *participle*. But surely this is a hasty inference, drawn from the doctrine of *absolute time* and a *definite present*, which we have already shown to be groundless and contradictory. When we speak simply of an action as *present*, we must mean that it is *present* with respect to something besides itself, or we speak a jargon which is unintelligible, but we do not ascertain the time of its presence. From the very nature of time, an action may be *present now*, it may have been *present formerly*, or it may be *present* at some future period; but the precise time of its presence cannot be ascertained even by the *present* of the indicative of the verb itself; yet who ever supposed that the *present* of the indicative denotes *no time*? The *participle* of the *present* represents the action of the verb as going on; but an action cannot be going on without being *present* in time with something. When, therefore, Cebes says, "We were walking in the temple of Saturn," he represents the action of the verb *walk* as *present* with something; but by using the verb expressive of his assertion in a *past tense*, he gives us to understand that the action was not present with any thing at the period of his speaking, but at some portion of time prior to that period: what that portion of time was, must be collected from the subsequent parts of his discourse. The same is to be said of the phrases *I was writing yesterday*, and *I shall be writing to-morrow*. They indicate, that the action of the verb *WRITE* was present with me yesterday, and will again be present with me to-morrow. The action, and the time of action, are denoted by the *participle*; that action is affirmed to belong to me by

means of the verb; and the time at which it belonged to me is pointed out by the tenses of that verb, *am*, *was*, and *shall be*. All this is so plain, that it could not have escaped Dr Beattie's penetration, had he not hastily adopted the absurd and contradictory notion of a *definite present*.

Of the truth of his assertion respecting *past participles*, he gives a Greek and a Latin example. The former is taken from St Mark: *ο πισυσας σωθησεται*; and the latter is that which is commonly called the *perfect future* of the passive verb *amor*, *amatus fuero*. In the first instance, he says that the *participle*, though belonging to the aorist of the *past time*, must be rendered either by the *indefinite present*, "he who believeth;" or by the *future*, "he who will believe;" and the reason which he gives for this rendering of the word is, that "the believing here spoken of is considered as *posterior* in time to the enunciation of the promise." This is indeed true, but it is not to the purpose; for with the enunciation of the promise, the time of the *participle* has no manner of concern. The time of *πισυσας* depends entirely upon the time of *σωθησεται*, with respect to which it must undeniably be *past*. Our Lord is not here asserting, that he who shall believe at the day of final retribution, shall be saved; but that he who shall on that day be found to have believed in time *past*, shall be saved: and if the *participle* had not been expressive of a *finished action* and a *past time*, the whole sentence would have conveyed a meaning not friendly to the interests of the gospel. In like manner, the time of *amatus* is referred, not to the time of speaking, but to the time of *fuero*, with respect to which, who sees not that it is *past*? The two words, taken together, contain a declaration, that he who utters them shall, at some time *posterior* to that of speaking, have been loved; shall have been loved denotes two times, both future with respect to the time of speaking; but when the time, denoted by *shall have*, comes to be present, that of the *participle* loved must be *past*, for it is declared that the action of it shall then be complete and finished.

We conclude, then, that it is essential to a *participle* to express both an attribute and time; and that such words as denote *no time*, though they may be in the form of participles, as *doctus* "learned," *eloquens* "eloquent," &c. belong to another part of speech, which we now proceed to consider.

SECT. II. Of ADJECTIVES.

83. The nature of verbs and participles being understood, that of ADJECTIVES becomes easy. A verb implies (as we have said) an attribute, time, and an action; a *participle* implies only an attribute and time; and an ADJECTIVE implies only an attribute as belonging to some substance. In other words, an ADJECTIVE has no assertion, and it denotes only such an attribute as has not its essence either in motion or its privation. Thus, in general, the attributes of quantity, quality, and relation, such as *many*, *few*, *great*, *little*, *black*, *white*, *good*, *bad*, *double*, *treble*, &c. are all denoted by ADJECTIVES.

84. To understand the import and the use of this species of words, it must be observed that every adjective is resolvable into a substantive and an expression of connection equivalent to *of*. Thus, a good man is a man of goodness; where we see the attribute denoted by the adjective fully expressed by an abstract noun. But it is evident

evident that the noun *goodness* does not express the whole meaning of the adjective *good*; for every adjective expresses not only an attribute, but also the connection between the attribute and its substance; whereas in the abstract noun, the attribute is considered as a substance unconnected with any other substance.

In the next place, it is to be observed, that the connection expressed by adjectives, like that expressed by *of*, is of a nature so general and indefinite, that the particular kind of connection must, in some languages, be inferred from our previous knowledge of the objects between which it subsists, or it will for ever remain unknown. This might be proved by a variety of examples, but will perhaps be sufficiently evident from the following. *Color salubris* signifies colour that indicates health; *exercitatio salubris*, exercise that preserves health; *viæus salubris*, food that improves health; *medicina salubris*, medicine that restores health. In all these examples the connection expressed by the adjective form of *salubris* is different; and though it may be known from previous experience, there is nothing in any of the expressions themselves by which it can be ascertained. Thus, adjectives are each significant of an attribute and connection; but the particular kind of connection is ascertained by experience.—The usual effect of adjectives in language, is to modify or particularise a general term, by adding some quality or circumstance which may distinguish the object meant by that term, from the other objects of the same species. I have occasion, for example, to speak of a particular man, of whose name I am ignorant. The word *man* is too general for my purpose, it being applicable to every individual of the human species. In what way then do I proceed, in order to particularize it, so as to make it denote that very man whom I mean to specify? I annex or conjoin to it such words as are significant of objects and qualities with which he is connected, and which are not equally applicable to others from whom I mean to distinguish him. Thus I can say, a man of prudence or a prudent man, a wise man, a good man, a brave man, &c. By these additions the general term *man* is limited, or modified, and can be applied only to certain men to whom belong the attributes expressed by the adjectives *prudent*, *wise*, *good*, and *brave*. If it be still too general for my purpose, I can add to it other qualities and circumstances, till I make it so particular as to be applicable to but one individual man in the universe.

85. This is the way in which ADJECTIVES are commonly used, but it is not the only way. Instead of being employed to modify a substantive, they sometimes appear as the principal words in the sentence, when the sole use of the substantive seems to be to modify the abstract noun, contained under the adjective to which that substantive is joined. In order to understand this, it will be necessary to attend to the following observations.

It may be laid down as a general proposition, that when any term or phrase is employed to denote a complex conception, the mind has a power of considering, in what order it pleases, the simple ideas of which the complex conception is composed. To illustrate this observation by an example: The word *eques* in Latin, denotes a complex conception, of which the constituent simple ideas are those of a man and a horse; with this connection subsisting between them, that the man is conceived as on

Nº 142.

the back of the horse. In the use of this word, it is well known that the idea first in order, as being the principal subject of the proposition, is commonly the MAN on the back of the horse; but it is not so always, for the mind may consider the HORSE as the principal object. Thus when Virgil says,

*Fræna Pelæthronii Lapithæ gyroſque dedere,
Impoſiti dorſo; atque EQUITEM docuere ſub armis
INSULTARE SOLO, et GRESSUS GLOMERARE ſuperbos —*

the energies attributed to the object signified by *EQUITEM*, make it evident that the horse and not the man is meant; for it is not the property of a man, *insultare ſolo, et gressus glomerare ſuperbos*.

The same observation holds true where the complex object is denoted by two or more words; an adjective, for instance, and a substantive. Thus in the phrase *ſummus mons ſe inter nubila condit*, the words *ſummus mons* represent a complex conception, of which the constituent ideas are those of height and mountain, connected together by the adjective form of *ſummus*. Either of these ideas may be the subject of the proposition; and the expression will accordingly admit of two different significations. If *mons* be made the subject of the proposition, the meaning will be, “the highest mountain hides itself among the clouds.” If the substantive included in the radical part of *ſummus* be made the subject of the proposition, the expression will signify, “the summit, or highest part of the mountain, hides itself among the clouds.” The latter is the true import of the sentence.

86. From these observations and examples, we shall be enabled to understand the two uses of the adjective. It is either employed, as has been already observed, to restrict or modify a general term; or the abstract substantive contained in the adjective is modified by the noun, with which, in the concrete or adjective form, that abstract substantive is joined. The first may be called the direct, the second the inverse, acceptation of adjectives.

The inverse acceptation of adjectives and participles (for both are used in the same manner) has not, except in a very few instances, been noticed by any grammarian; yet the principle is of great extent in language. In order to explain it, we shall produce a few examples; which on any other principle it is impossible to understand.

Livy, speaking of the abolition of the regal authority at Rome, says, *Regnatum eſt Romæ ab URBE CONDITA ad LIBERATAM annos ducentos quadraginta quatuor*, “Monarchy subsisted at Rome, not from the city built (which would convey no meaning), but from the building of the city, to its deliverance,” &c. Both the participles *condita* and *liberatam* are here used inversely; that is, the abstract substantives contained in *condita* and *liberatam* are modified or restricted by the substantives *urbe* and *urbem*, with which they unite. Again, *Ovid*, speaking of the contest between *Ajax* and *Ulyſſes* for the arms of *Achilles*, has these lines:

*Qui, licet eloquio fidum quoque Neſſora vincat,
Haud tamen efficiet, DESERTUM ut NEſTORA CRIMEN
Nullum eſſe rear. —*

Here also the adjective or participle *DESERTUM* is taken inversely, and the general notion of desertion contained in it is modified or rendered particular by being joined with the substantive *NESTORA*. The meaning of the passage

93
The usual effect of adjectives is to modify a general term.

94
The reverse of this is sometimes the case.

95
Two uses of the adjective.

passage is, "I will never be induced to believe that the desertion of Nestor was not a crime." Were *desertum* to be taken directly as an adjective modifying its substantive, the sentence must be translated, "I cannot believe that Nestor deserted was not a crime." But it is evident that this is nonsense; as NESTOR, whether *deserted* or not *deserted*, could not be a crime.

It were easy to produce many more examples of adjectives taken *inversely*; but these may suffice to illustrate the general principle, and to show, that without attending to it, it is impossible to understand the ancient authors. We shall adduce one instance of it from Shakespeare, to evince that it is not confined to the ancient languages, though in these it is certainly more frequent than in the modern:

"Freeze, freeze, thou bitter sky;
"Thou canst not bite so high
"As *benefits* forget:
"Though thou the waters warp,
"Thy sting is not so sharp
"As friends remember'd not."

Here it is evident, that the adjective FORGOT is taken *inversely*; for it is not a benefit, but the forgetting of a benefit, which bites more than the bitter sky: and therefore, in this passage, the adjective serves not to modify the noun; but the noun *benefits* is employed to modify the abstract substantive contained in the adjective *forgot*, which is the subject of the proposition, and the principal word in the sentence.

Had Mr Harris attended to this principle, and reflected upon what he could not but know, that all adjectives denote substances; not indeed *subsisting by themselves*, as those expressed by nouns, but *concretely*, as the attributes of other substances; he would not have classed adjectives with verbs, or have passed so severe a censure upon the grammarians for classing them with nouns. It matters very little how adjectives are classed, provided their nature and effect be understood; but they have at least as good a title to be ranked with nouns as with verbs, and in our opinion a better. To adopt Mr Harris's language, they are *homogeneous* with respect to nouns, as both denote substances; they are *heterogeneous* with respect to verbs, as they never do denote assertion.

96
Adjectives
formed
from sub-
stantives,

97
And from
pronouns.

87. Besides original adjectives there is another class, which is formed from substantives. Thus, when we say, *the party of Pompey, the style of Cicero, the philosophy of Socrates*; in these cases, the party, the style, and the philosophy spoken of, receive a stamp and character from the persons whom they respect: Those persons, therefore, perform the part of attributes. Hence they actually pass into attributives, and assume as such the form of adjectives. It is thus we say, *the Pompeian party, the Ciceronian style, and the Socratic philosophy*. In like manner, for a trumpet of brass, we say a brazen trumpet, and for a crown of gold, a golden crown, &c. Even pronominal substantives admit the like mutation. Thus, instead of saying, *the book of me, and of thee*, we say *my book, and thy book*; and instead of saying, *the country of us, and of you*, we say *our country, and your country*. These words *my, thy, our, your, &c.* have therefore been properly called *pronominal adjectives*.

VOL. VIII. Part I.

88. It has been already observed, and must be obvious to all, that substances alone are susceptible of sex; and that therefore substantive nouns alone should have distinctions respecting gender. The same is true with respect to number and person. An ATTRIBUTE admits of no change in its nature, whether it belong to YOU or to ME, to a MAN or a WOMAN, to ONE man or to MANY; and therefore the words expressive of attributes, ought on all occasions, and in every situation, to be fixed and invariable. For as the qualities good and bad, black and white, are the same, whether they be applied to a man or a woman, to many or to few; so the word which expresses any one of these attributes ought in strictness to admit of no alteration with whatever substantive it may be joined. Such is the order of nature; and that order, on this as on other occasions, the English language most strictly observes: for we say equally, *a good man or a good woman; good men or good women; a good house or good houses*. In some languages, indeed, such as Greek and Latin, of which the nouns admit of cases, and the sentences of an inverted structure, it has been found necessary to endow adjectives with the threefold distinction of gender, number, and person; but as this is only an accidental variation, occasioned by particular circumstances, and not in the least essential to language, it belongs not to our subject, but to the particular grammars of these tongues.

98
Adjectives
from their
nature
should have
no varia-
tion to de-
note sex,
number, or
person.

There is, however, one variation of the adjective, which has place in all languages, is founded in the nature of things, and properly belongs to universal grammar. It is occasioned by comparing the attribute of one substance with a similar attribute of another, and falls naturally to be explained under the next section.

99
They have,
however,
one varia-
tion found-
ed in the
nature of
things.

SECT. III. Of ADVERBS, and the Comparison of ADJECTIVES.

89. As adjectives denote the attributes of substances, so there is an inferior class of words which denote the modifications of these attributes. Thus, when we say "*Cicero and Pliny were both of them eloquent; Statius and Virgil both of them wrote*," the attributes expressed by the words *eloquent* and *wrote* are immediately referred to Cicero, Virgil, &c.; and as denoting the attributes of substances, these words, the one an adjective and the other a verb, have been both called ATTRIBUTIVES OF THE FIRST ORDER. But when we say, "*Pliny was moderately eloquent, but Cicero exceedingly eloquent; Statius wrote indifferently, but Virgil wrote admirably*," the words *moderately, exceedingly, indifferently, and admirably*, are not referable to substantives, but to other attributes; that is, to the words *eloquent* and *wrote*, the signification of which they modify. Such words, therefore, having the same effect upon adjectives that adjectives have upon substantives, have been called ATTRIBUTIVES OF THE SECOND ORDER. By grammarians they have been called ADVERBS; and, if we take the word VERB in its most comprehensive signification (A), as including not only verbs properly so called, but also every species of words, which, whether essentially or accidentally, are significant of the attributes of substances, we shall find the name ADVERB

100
The import
of adverbs.

101
The reason
of their
name.

K

to

(A) Aristotle and his followers called every word a verb, which denotes the predicate of a proposition. This classification was certainly absurd; for it confounds not only adjectives and participles, but even substantives, with verbs: but the authority of Aristotle was great; and hence the name of adverb, though that word attaches itself only to an adjective or participle, or a verb significant of an attribute: it does not attach itself to the pure verb.

to be a very just appellation, as denoting A PART OF SPEECH, THE NATURAL APPENDAGE OF SUCH VERBS. So great is this dependence in grammatical syntax, that an *adverb* can no more subsist without its *verb*, i. e. without *some word* significant of an *attribute*, than a *verb* or *adjective* can subsist without its *substantive*. It is the same here as in certain natural subjects. Every *colour*, for its existence, as much requires a *superficies*, as the *superficies* for its existence requires a *solid body*.

102
Adverbs
denoting
intension
and remission.

90. Among the attributes of substances are reckoned *quantity* and *quality*: thus we say a *white garment*, a *high mountain*, &c. Now some of these quantities and qualities are capable of *intension* or *remission*; or, in other words, *one substance* may have them in a *greater* or *less degree* than another. Thus we say, a *garment EXCEEDINGLY white*, a *mountain TOLERABLY* or *MODERATELY high*. Hence, then, one copious source of *secondary attributives* or *ADVERBS* to denote these two, that is, *intension* and *remission*; such as *greatly*, *tolerably*, *vastly*, *extremely*, *indifferently*, &c.

103
Attributes
of the same
kind compared
by means of
such adverbs.

But where there are different intensions of the same attribute, they may be *compared* together: Thus, if the garment A be *EXCEEDINGLY white*, and the garment B be *MODERATELY white*, we may say, the garment A is *MORE white* than the garment B. This *paper* is *white*, and *snow* is *white*; but *snow* is *MORE white* than this *paper*. In these instances, the adverb *MORE* not only denotes *intension*, but *relative intension*: nay, we stop not here, as we not only denote *intension* merely *relative*, but *relative intension* than which there is none greater. Thus we say, *Sophocles* was *wise*, *Socrates* was *MORE wise* than he, but *Solomon* was the *MOST wise* of men. Even *verbs*, properly so called, which denote an *attribute* as well as an *assertion*, must admit both of *simple* and also of *comparative intensions*; but the *simple verb* TO BE admits of neither the one nor the other. Thus, in the following example, *Fame* he *LOVETH MORE* than riches; but *virtue* of all things he *LOVETH MOST*; the words *MORE* and *MOST* denote the different *comparative intensions* of the attribute included under the verb *loveth*; but the *assertion* itself, which is the *essential* part of the *verb*, admits neither of *intension* nor *remission*, but is the same in all possible propositions.

104
The comparison
of adjectives,
either by
adverbs,

91. From this circumstance of *quantities* and *qualities* being capable of *intension* and *remission*, arise the *COMPARISON* of *adjectives*, and its different *DEGREES*, which cannot well be more than the two species above mentioned; one to denote *simple excess*, and one to denote *superlative*. Were we indeed to introduce more degrees than these, we ought perhaps to introduce *infinite*, which is absurd. For why stop at a limited number, when, in all subjects susceptible of *intension*, the intermediate excesses are in a manner *infinite*? Between the first *simple white* and the superlative *whitest*, there are infinite degrees of *more white*; and the same may be said of *more great*, *more strong*, *more minute*, &c. The doctrine of grammarians about *three* such degrees of comparison, which they call the *positive*, the *comparative*, and the *superlative*, must be absurd; both because in their *positive* there is no *comparison* at all, and because their *superlative* is a *comparative* as much as their *comparative* itself. Examples to evince this may be met with every where: *Socrates* was the *MOST WISE* of all the *Athenians*; *Homer* was the *MOST SUBLIME* of all poets, &c. In

this sentence *Socrates* is evidently compared with the *Athenians*, and *Homer* with all other poets. Again, if it be said that *Socrates* was *MORE WISE* than any other *Athenian*, but that *Solomon* was the *MOST WISE* of men; is not a comparison of *Solomon* with mankind in general, as plainly implied in the last clause of the sentence, as a comparison of *Socrates* with the other *Athenians* in the first?

But if both imply comparison, it may be asked, In what consists the difference between the *comparative* and *superlative*? Does the *superlative* always express a *greater excess* than the *comparative*? No: for though *Socrates* was the *most wise* of the *Athenians*, yet is *Solomon* affirmed to have been *more wise* than he; so that here a *higher superiority* is denoted by the *comparative* *more* than by the superlative *most*. Is this then the difference between these two degrees, that the *superlative* implies a comparison of *one* with *many*, while the *comparative* implies only a comparison of *one* with *one*? No: this is not always the case neither. The Psalmist says, that "he is *wiser* (or *more wise*) than all his teachers;" where, though the *comparative* is used, there is a comparison of *one* with *many*. The real difference between these two degrees of comparison may be explained thus:

When we use the *superlative*, it is in consequence of having compared *individuals* with the *species* to which they belong, or one or more *species* with the *genus* under which they are comprehended. Thus, *Socrates* was the *MOST WISE* of the *Athenians*, and the *Athenians* were the *MOST ENLIGHTENED* of ancient nations. In the first clause of this sentence, *Socrates*, although compared with the *Athenians*, is at the same time considered as one of them; and in the last, the *Athenians*, although compared with *ancient nations*, are yet considered as one of those nations. Hence it is that in *English* the *superlative* is followed by the preposition *of*, and in *Greek* and *Latin* by the *genitive case* of the *plural* number; to show, that the object which has the pre eminence is considered as *belonging to that class* of things with which it is compared.

But when we use the *comparative* degree, the objects compared are set in direct opposition; and the one is considered not as a part of the other, or as comprehended under it, but as something altogether distinct and belonging to a different class. Thus, were one to say, "Cicero was *more eloquent* than the Romans," he would speak absurdly; because every body knows, that of the class of men expressed by the word *Romans* Cicero was one, and such a sentence would affirm that orator to have been more eloquent than himself. But when it is said that "Cicero was *more eloquent* than all the other Romans, or than any other Roman," the language is proper, and the affirmation true: for though the persons spoken of were all of the same class or city, yet Cicero is here set in contradistinction to the rest of his countrymen, and is not considered as one of the persons with whom he is compared. It is for this reason that in *English* the *comparative* degree is followed by a noun governed by the word of contradistinction *than*, and in *Latin* by a noun in the *ablative case* governed by the preposition *præ* (B) either expressed or understood. We have already observed, that the *ablative case* denotes concomitancy: and therefore when

an

(B) See Ruddimanni Grammaticæ Institutiones, Pars secunda, lib. i. cap. 2.

Although it is certainly true, that when we use the *superlative*, we ought in propriety to consider the things compared.

an adjective in the comparative degree is prefixed to a noun, that noun is put in the *ablative case*, to denote that two things are compared together in *company*; but by means of the preposition, expressed or understood, that which is denoted by the *comparative adjective* is seen to be preferred *before* that which is denoted by the noun.

105
Or by inflexion.

92. We have hitherto considered *comparatives* as expressed by the words *more* and *most*; but the authors, or improvers of language, have contrived a method to retrench the use of these *adverbs*, by expressing their force by an *inflexion* of the *adjective*. Thus, instead of *more fair*, they say FAIRER; instead of *most fair*, FAIREST: and the same method of comparison takes place both in the Greek and Latin languages; with this difference, however, between the genius of these languages and ours, that we are at liberty to form the comparison either in the one method or in the other; whereas in those languages the comparison is seldom if ever formed by the assistance of the adverb, but always by the inflexion of the adjective. Hence this inflexion is by the Greek and Latin grammarians considered as a *necessary accident* of the *adjective*; but it has reached no farther than to *adjectives*, and *participles sharing the nature of adjectives*. The attributes expressed by *verbs* are as susceptible of comparison as those expressed by *adjectives*; but they are always compared by means of *adverbs*, the *verb* being too much diversified already to admit of more variations without perplexity.

106
Comparatives sometimes lose their relative nature.

93. It must be confessed that *comparatives*, as well the *simple* as the *superlative*, seem sometimes to part with their *relative* nature, and to retain only their *intensive*. Thus in the degree denoting *simple excess*:

TRISTIOR, et lacrymis oculos suffusa nitentes. Virg.

Tristior means nothing more than that *Venus* was *very* sad. In the degree called the *superlative* this is more usual. Phrases extremely common are, *Vir doctissimus*, *vir fortissimus*, "a most learned man, a most brave man;" i. e. *not* the *bravest* and *most learned* man that ever existed, but a man possessing those qualities in an *eminent degree*. In English, when we intimate that a certain quality is possessed in an *eminent degree*, without making any *direct comparison* between it and a similar quality, we do it by the *intensive* word *very*, more commonly than by *most*: as, *Cicero was VERY eloquent*; *the mind of Johnson was VERY vigorous*. This mode of expression has been called the *superlative of eminence*, to distinguish it from the *other superlative*, which is *superlative upon comparison*. Yet it may be said, that even in

the *superlative of eminence* something of *comparison* must be *remotely* or *indirectly* intimated, as we cannot reasonably call a man *very* eloquent without comparing *his* eloquence with the eloquence of *other men*. This is indeed true; but we cannot therefore affirm that *comparison* is more clearly intimated in *this superlative* than in the *simple adjective eloquent*: for when we say that a man is *eloquent*, we mark between *his* eloquence and that of *other men* a distinction of the same *kind*, though not in the same *degree*, as when we say that he is *very* eloquent.

In English we distinguish the two superlatives, by prefixing to the *one* the definite article *the*, to show that something is predicated of the object expressed by it, which cannot be predicated of *any other* object; and by subjoining the preposition *of*, to show that the objects with which it is compared are of the same class with itself: as, "Solomon was *the* wisest *of* men; Hector was *the* most valiant *of* the Trojans." To the *other* (c) superlative we only prefix the indefinite article *a*: as, "he was *a* very good man: he was *a* most valiant soldier."

94. As there are some *qualities* which admit of *comparison*, so there are others which admit of none: such, for example, are those which denote that *quality of bodies arising from their figure*; as when we say, a *circular* table, a *quadrangular* court, a *conical* piece of metal, &c. The reason is, that a million of things participating the same figure, participate it *equally*, if they do it at all. To say, therefore, that while A and B are both *quadrangular*, A is *more* or *less* quadrangular than B, is absurd. The same holds true in all attributes denoting *definite quantities* of whatever nature: for as there can be no comparison without *intension* or *remission*, and as there can be no intension or remission in *things always definite*, therefore these attributes can admit of no comparison. By the same method of reasoning, we discover the cause why no *substantive* is *susceptible of these degrees of comparison*. A mountain cannot be said *MORE TO BE OR TO EXIST* than a mole-hill; but the *more* or *less* must be sought for in their quantities. In like manner, when we refer many individuals to one species, the lion A cannot be called *more a lion* than the lion B (D); but if more any thing, he is *more fierce*, *more swift*, or exceeding in some such attribute. So again, in referring many species to one genus, a crocodile is not *more an animal* than a lizard; nor a tiger more than a cat: but, if any thing, the crocodile and tyger are *more bulky*, *more strong*, &c. than

107
Adjectives which admit not of degrees of comparison.

K 2

the

compared as of the same class; and when we use the *comparative*, as of different classes; yet is not this *distinction* always attended to by the best writers in any language. In Latin and Greek the *comparative* is sometimes used, where in English we should use the *superlative*; as *dextera est fortior manuum*; and in the Gospel it is said, that "a grain of mustard-seed is the *smaller* (μικροτέρος) of all seeds, but when grown up it is the *greater* (μεγας) of herbs." Even in English, the custom of the language permits us not to say "he is the *tallest* of the two," it must be the *taller* of the two; but we cannot say "he is the *taller* of the three," it must be the *tallest*. For these and other deviations from the general rule no reason is to be found in the nature of things; they are errors made proper by use.

(c) In English, the termination *est* is peculiar to the superlative of *comparison*, to which the *definite* article is prefixed. Thus we may say, "Homer was *the* sublimest of poets;" but we cannot say, "Homer was *a* sublimest poet." Again, we may say, "Homer was *a* very sublime poet;" but not, "Homer was *the* very sublime poet."

(D) When Pope says of a certain person, that he is "a tradesman, meek, and *much* a liar;" the last phrase is the same with *much* given to lying, the word *liar* having the effect of an *attributive*.

the animals with which they are compared; the excess, as before, being derived from their attributes.

108
Adverbs
divided in-
to classes.

95. Of the *adverbs* or *secondary attributives* already mentioned, those denoting *intension* and *remission* may be called ADVERBS OF QUANTITY CONTINUOUS, as *greatly*, *vastly*, *tolerably*, &c.; *once*, *twice*, *thrice*, &c. (E) are ADVERBS OF QUANTITY DISCRETE; *more* and *most*, *less* and *least*, to which may be added *equally*, *proportionally*, &c. are ADVERBS OF RELATION. There are others of QUALITY: as when we say, *HONESTLY industrious*, *PRUDENTLY brave*; *they fought BRAVELY*, *he painted FINELY*.

And here it may be worth while to observe, how the same thing, participating the same essence, assumes different grammatical forms from its different relations. For example, suppose it should be asked, How differ *honest*, *honestly*, and *honesty*? The answer is, They are in *essence* the same: but they differ in as much as *honest* is the *attributive* of a *noun*; *honestly*, of *verb* or *adjective*; and *honesty* being divested of these its attributive relations, assumes the power of a *noun* or *substantive*, so as to stand by itself.

96. The adverbs hitherto mentioned are common to *verbs of every species*; but there are some which are confined to *verbs properly so called*, that is, to such verbs as denote *motions* or *energies* with their *privations*. All *motion* and *rest* imply *time* and *place* as a kind of necessary coincidence. Hence, when we would express the place or time of either, we have recourse to *adverbs* formed for this purpose; of *PLACE*, as when we say, *he stood THERE*, *he went HENCE*, *he came HITHER*; of *time*, as when we say, *he stood THEN*, *he went AFTERWARDS*, *he travelled FORMERLY*. To these may be added the adverbs which denote the *intensions* and *remissions peculiar to motion*, such as *speedily*, *hastily*, *swiftly*, *slowly*, &c.; as also adverbs of *place* made out of *prepositions*, such as *upward* and *downward* from *up* and *down*. It may, however, be doubted whether some of these words, as well as many others, which do not so properly *modify attributes*, as mark some *remote circumstance* attending an attribute or our way of conceiving it, are truly *adverbs*, though so called by the grammarians. The simple *affirmative* and *negative* YES and NO are called *adverbs*, though they surely do not signify that which we hold to be the very essence of the adverb, a *modification of attributes*. "Is he learned? No." "Is he brave? Yes." Here the two adverbs, as they are called, signify *not* any *modification* of the attributes *brave* and *learned*, but a total negation of the attribute in the one case, and in the other a declaration that the attribute belongs to the person spoken of.

109
The mean-
ing of ad-
verbs to be
ascertained
by etymo-
logy.

110
Many of
them mere
abbrevia-
tions.

Adverbs are indeed applied to many purposes; and their general nature may be better understood by reading a list of them, and attending to their etymology, than by any general description or definition. Many of them seem to have been introduced into language in order to express by *one word* the meaning of two or three; and are mere abbreviations of nouns, verbs, and adjectives. Thus, the import of the phrase, *in what place*, is expressed by the single word *WHERE*; *to what place*, by *WHITHER*; *from this place*, by *HENCE*; *in a direction ascending*, by *UPWARDS*; *at the present time*, by

NOW; *at what time*, by *WHEN*; *at that time*, by *THEN*; *many times*, by *OFTEN*; *not many times*, by *SELDOM*, &c.

97. Mr Horne Tooke has, with great industry and accuracy, traced many of the English adverbs from their origin in the ancient Saxon and other northern tongues, and shown them to be either corruptions of other words or abbreviations of phrases and sentences. He observes, that "all adverbs ending in *ly*, the most prolific branch of the family, are sufficiently understood: the termination being only the word *like* corrupted; and the corruption so much the more easily and certainly discovered, as the termination remains more pure and distinguishable in the other sister languages, in which it is written *lick*, *lyk*, *lig*, *ligen*." He might have added, that in Scotland the word *like* is, at this day, frequently used instead of the English termination *ly*; as for a *goodly figure*, the common people say a *good-like figure*. Upon this principle the greater part of *adverbs* are resolved into those parts of speech which we have already considered, as *honestly* into *honest like*, *vastly* into *vast-like*, &c. so that when we say of a man he is *honestly industrious*, we affirm that he is *honest-like industrious*, or that his *industry* has the *appearance* of being *honest*. *Adverbs* of a different termination the same acute writer resolves thus: *AGHAST* into the past participle *AGAZED*;

"The French exclaimed,—the devil was in arms.

"All the whole army stood *agazed* on him" *Shakespeare*.

AGO, into the past participle *AGONE* or *GONE*. *ASUNDER* he derives from *ASUNDRED*, *separated*; the past participle of the Anglo Saxon verb *asundrian*: a word which, in all its varieties, is to be found, he says, in all the northern tongues; and is originally from *fond*, i. e. *sand*. *TO WIT*, from *WITTAN to know*; as *videlicet* and *scilicet*, in Latin, are abbreviations of *videre-licet* and *scire licet*. *NEEDS*, he resolves into *NEED IS*, used parenthetically; as, "I must *needs* do such a thing,"—"I must (*need is*) do such a thing;" i. e. "I must do it, there is *need* of it." *ANON*, which our old authors use for *immediately*, *instantly*, means, he says, *in one*; i. e. *in one instant*, *moment*, *minute*. *As*,

"And right *anon* withouten more abode."

"*Anon* in all the haste I can."

ALONE and *ONLY* are resolved into *ALL ONE*, and *ONE-LIKE*. In the Dutch, *EEN* is *one*; and *ALL-EEN* *alone*; and *ALL-EEN-LIKE*, *only*, anciently *alonely*. *ALIVE* is *on live*, or *in life*. Thus,

"Christ *etern* *on live*."

Chaucer.

AUGHT or *OUGHT*; *A WHIT* or *O WHIT*; *o* being formerly written for the article *A*, or for the numeral *ONE*; and *whit* or *hwit*, in Saxon, signifying a small thing, a *point* or *jot*. *AWHILE*, which is usually classed with *adverbs*, is evidently a *noun* with the indefinite article prefixed; a *while*, i. e. *a time*. *WHILST*, anciently and more properly *WHILES*, is plainly the Saxon *HWILE-ES*, *time that*. *ALOFT* was formerly written *ON-LOFT*: *As*,

"And ye, my mother, my soveregne pleasance

"Over al thing, *out take* Christ *ON LOFTE*" *Chaucer*.

Now, says Mr Horne Tooke, *lyst*, in the Anglo Saxon,

111

(E) These words were anciently written *one's*, *twie's*, *thrie's*; and are merely the genitives of *one*, *two*, *three*, the substantive *time* or *turn* being omitted. Thus, *How often did you write?* Answer, *Once*, i. e. *one's time*. See *Horne Tooke's Diversions of Purley*.

is the air or the clouds, as in LYFTE CUMMENDE, coming in the clouds, (St Luke.) In the Danish, LUFT is air; and "at spronge i lusten," to blow up into the air, or ALOFT. So in the Dutch, *de loef hebben*, to sail before the wind; *loeven*, to ply to windward; *loef*, the weather gage, &c. From the same root are our other words: *Loft*, *lofty*, to *luff*, *lee*, *leeward*, *lift*, &c. It would be needless, as the ingenious author observes, to notice such adverbs as, *afoot*, *adays*, *asbore*, *astray*, *aslope*, *aright*, *abed*, *aback*, *abreast*, *afloat*, *aloud*, *aside*, *afield*, *aground*, *aland*, &c. These are at first view seen for what they are. Nor shall we follow him through the analysis which he has given of many other adverbs, of which the origin is not so obvious as of these. Of the truth of his principles we are satisfied; and have not a doubt, but that upon those principles a man conversant with our earliest writers, and thoroughly skilled in the present languages, may trace every English (s) adverb to its source, and show that it is no part of speech separate from those which we have already considered. The adverbs, however, of affirmation and negation, are of too much importance to be thus passed over; and as we have never seen an account of them at all satisfactory, except that which has been given by Horne Tooke, we shall transcribe the substance of what he says concern AYE, YEA, YES, and NO. To us these words have always appeared improperly classed with adverbs upon every definition which has been given of that part of speech. Accordingly, our author says, that AYE or YEA is the imperative of a verb of northern extraction; and means, *have*, *possess*, *enjoy*. And YES is a contraction of AY-ES, *have*, *possess*, *enjoy*, *that*. Thus, when it is asked whether a man be learned, if the answer be by the word YES, it is equivalent to *have that*, *enjoy that*, *belief* or that proposition. (See what was said of the nature of interrogation, Chap. IV. n^o 76.

The northern verb of which *yea* is the imperative, is in Danish EJER, *to possess*, *have*, *enjoy*. EJA, *aye* or *yea*; EJE, *possession*; EJER, *possessor*. In Swedish it is EGA, *to possess*; of which the imperative is JA, *aye*, *yea*; EGARE, *possessor*. In German, JA signifies *aye* or *yea*; EIGENER, *possessor*, *owner*; EIGEN, *own*. In Dutch, EIGENEN is *to possess*; JA, *aye*, *yea*.

Greenwood derives NOT and its abbreviate NO from the Latin; Minshew, from the Hebrew; and Junius, from the Greek. Our author very properly observes, that the inhabitants of the North could not wait for a word expressive of dissent till the establishment of those nations and languages: and adds, that we need not be inquisitive nor doubtful concerning the origin and signification of NOT and NO; since we find that, in the

Danish, NODIG, in the Swedish, NODIG, and in the Dutch, NOODE, NODE, and NO, mean *averse*, *unwilling*. So that when it is asked whether a man be brave, if the answer be NO, it is a declaration that he who makes it is *averse* from or *unwilling* to admit that proposition.

98. Most writers on grammar have mentioned a species of adverbs, which they call *adverbs of interrogation*; such as *where*, *whence*, *whither*, *how*, &c. But the truth is, that there is no part of speech, which, of itself, denotes interrogation. A question is never asked otherwise than by abbreviation, by a single word, whether that word be a noun, a pronoun, a verb, or an adverb. The word WHERE is equivalent to—in *what place*; WHENCE to—from *what place*; and HOW to—in *what manner*, &c. In these phrases, IN *what place*, FROM *what place*, and IN *what manner*, the only word that can be supposed to have the force of an interrogative, is *what*, which is resolvable into *that which*: But we have already explained, in the chapter of Pronouns, the principles upon which the relative is made to denote interrogation, and the same reasoning will account for the adverbs *where*, *whence*, *whither*, *how*, &c. being employed as interrogatives. When we say, *where were you yesterday?* *whence have you come?* *whither are you going?* *how do you perform your journey?* We merely use so many abbreviations for the following sentences; tell us, or describe to us, THE PLACE *where* (or in which) you were yesterday; THE PLACE *whence* (or from which) you have come; THE PLACE *to which* you are going; THE MANNER *in which* you perform your journey. And so much for adverbs. We now proceed to those parts of speech which are usually called *prepositions* and *conjunctions*, and of which the use is to connect the other words of a sentence, and to combine two or more simple sentences into one compound sentence.

CHAPTER VI.

Of PREPOSITIONS, CONJUNCTIONS, and INTERJECTIONS.

99. It has been observed, that a man while awake is conscious of a continued train of perceptions and ideas passing in his mind, which depends little upon his own will; that he cannot to the train add a new idea; and that he can but very seldom break its connection. To the slightest reflection these truths must be apparent. Our first ideas are those which we derive from external objects making impressions on the senses; but all the external objects which fall under our observation are linked together in such a manner as indicates them to be parts of one great and regular system.

(s) The same resolution might probably be made of the Greek and Latin adverbs, were we as intimately acquainted with the sources of those tongues as Mr Horne Tooke is with the sources of the English language. Many of the Latin adverbs (says the learned Ruddiman) are nothing else but adjective nouns or pronouns, having the preposition and substantive understood; as, *quo*, *eo*, *eodem*, for *ad quæ*, *ea*, *eadem* (*loca*), or *cui*, *ei*, *eidem* (*loco*); for of old these datives ended in *o*. Thus, *qua*, *hac*, *illac*, &c. are plainly adjectives in the abl. sing. *femin.* the word *via* "a way," and the preposition *in*, being understood. Many of them are compounds; as, *quomodo*, i. e. *quæ modo*; *quemadmodum*, i. e. *ad quem modum*; *quamobrem*, i. e. *ob quam rem*; *quare*, i. e. (*pro*) *qua re*; *quorsum*, i. e. *versus quem* (*locum*); *scilicet*, i. e. *scire licet*; *videlicet*, i. e. *videre licet*; *ilicet*, i. e. *ire licet*; *illico*, i. e. *in loco*; *magnopere*, i. e. *magno opere*; *nimirum*, i. e. *ni (est) mirum*; *hodie*, i. e. *hoc die*; *postridie*, i. e. *postero die*; *pridie*, i. e. *præ die*. *Profecto*, *certe*, *sane*, *male*, *bene*, *plane*, are obviously adjectives. *Forte* is the ablative of *fors*; and if we had leisure to pursue the subject, and were masters of all the languages from which the Latin is derived, we doubt not but we should be able to resolve every adverb into a substantive or adjective.

112
By various
relations:

system. When we take a view of the things by which we are surrounded, and which are the archetypes of our ideas, their inherent qualities are not more remarkable than the various relations by which they are connected. *Cause and effect, contiguity in time or in place, high and low, prior and posterior, resemblance and contrast*, with a thousand other relations, connect things together without end. There is not a single thing which appears solitary and altogether devoid of connection. The only difference is, that some are intimately and some slightly connected, some nearly and some at a distance. That the relations by which external objects are thus linked together must have great influence in directing the train of human thought, so that not one perception or idea can appear to the mind wholly unconnected with all other perceptions or ideas, will be admitted by every man who believes that his senses and intellect represent things as they are.

This being the case, it is necessary, if the purpose of language be to communicate thought, that the speaker be furnished with words, not only to express the ideas of substances and attributes which he may have in his mind, but also to indicate the order in which he views them, and to point out the various relations by which they are connected. In many instances all this may be done by the parts of speech which we have already considered. The closest connection which we can conceive is that which subsists between a substance and its qualities; and in every language with which we are acquainted, that connection is indicated by the immediate coalescence of the *adjective* with the *substantive*; as we say, *a good man, a learned man; vir bonus, vir doctus*. Again, there is a connection equally intimate, though not so permanent, between an *agent* and his *action*: for the action is really an attribute of the agent; and therefore we say, *the boy reads, the man writes*; the noun coalescing with the verb so naturally, that no other word is requisite to unite them. Moreover, an *action* and *that* which is *acted upon* being contiguous in nature, and mutually affecting each other, the words which denote them should in language be mutually attractive, and capable of coalescing without external aid; as, *he reads a book, he builds a house, he breaks a stone*. Further: because an *attribute* and its *modifications* are inseparably united, an *adjective* or a *verb* is naturally connected with the *adverb* which illustrates or *modifies* its signification; and therefore, when we say, *he walks slowly, he is prudently brave*, it is plain that no other word is necessary to promote the coalescence of the attributes *walking* and *bravery* with their modifications of *slowness* and *prudence*. The agreement between the terms of any proposition which constitutes truth is absolutely perfect; but as *either* of the terms may agree with *many other* things besides its *correlate*, some word is requisite in every proposition to connect the particular *predicate* with the particular *subject*: and that is the office of the simple verb *TO BE*; as, *the three angles of every rectilineal triangle ARE equal to two right angles*.

Thus we see, that many of the relations subsisting between our ideas may be clearly expressed by means of *nouns, adjectives, verbs, and adverbs*; and in those languages of which the nouns have *cases*, there is perhaps no relation of much importance which might not be thus pointed out, without being under the necessity of employing the aid of any additional part of speech.

In English, however, the case is otherwise; for were we to say, "He rode Edinburgh, went the parliament-house, walked his counsel the court met," we should speak unintelligibly; as in these expressions there is either a total want of connection, or such a connection as produces falsehood and nonsense. In order to give meaning to the passage, the several gaps must be filled up by words significant of the various relations by which the different ideas are connected in the mind; as, "He rode *to* Edinburgh, went *to* the parliament-house, and walked *with* his counsel *till* the court met." Of these *connecting* words, *TO* and *WITH* are called *prepositions*, *AND* and *TILL* are usually called *conjunctions*. Although these *prepositions* and *conjunctions* are not so *absolutely necessary* in Greek and Latin as they are in English; yet as there is no language wholly without them, nor any language in which it is not of importance to understand their force, they well deserve a place in universal grammar.

100. The sole use of *conjunctions* and *prepositions* in language is to connect either *sentences* or *other words*; but the theory of these *connectives* themselves has certainly never been understood, unless HORNE TOOKE have at last hit upon the truth. Mr HARRIS writes *about them* and *about them*, quoting passages from Greek and Latin authors, and produces at last no information. His *definitions* of both, as *parts of speech void of signification*, are highly absurd; and even the principal *distinction* which he makes between them seems not to be well founded. *Prepositions* and *conjunctions* denote the *relations* subsisting between the ideas expressed by those words or sentences which they serve to connect; and as *relations* are contemplated by the mind as well as *positive ideas* themselves, the *words* which denote those relations cannot be *insignificant*. The essential difference between the *conjunction* and *preposition*, according to the same author, consists in this, that the *former* connects *sentences*, and the *latter words*: but the fact is often otherwise. An obvious example occurs where the conjunction *AND* connects *not sentences* but *words*. "A man of *WISDOM* and *VIRTUE* is a perfect character." Here it is not meant to be asserted, "that the man of *WISDOM* is a perfect character, and that the man of *VIRTUE* is a perfect character:" both these assertions would be false. This sentence therefore (and many such will occur) is not resolvable into two: whence it follows, that the conjunction *AND* does not always connect *sentences*; and the same is frequently the case with other *conjunctions*.

Horne Tooke's idea of *prepositions* and *conjunctions* is, that they do not form *distinct classes* of words, but are merely *abbreviations* of *nouns* and *verbs*: and with respect to the *English* language, he has been remarkably successful in proving his position. But though such be undeniably the case in English, it would be rash to conclude *a priori* that it is so in all other tongues. To establish this general conclusion would require a long and tedious deduction in each particular language: and how much learning, leisure, industry, and acuteness, such an undertaking would require, even in one tongue, it is not easy to determine. In the languages with which we are best acquainted, many *conjunctions*, and most *prepositions*, have the appearance at least of *original words*: and though this most acute grammarian, from his knowledge of the northern tongues, has been able to trace the most important of those in English to very

113
Expressed
by preposi-
tions and
conjunc-
tions.

114
These con-
nect either
sentences or
words.

very

very plausible sources, the same thing would be difficult in other languages of which the sources are obscure, and absolutely impossible in those of which they are wholly unknown. It is, however, a strong presumption in favour of his opinion, that grammarians have never been able to assign any *general characteristic* of those species of words; which, did they constitute *distinct parts of speech*, one would think could not have so long remained undiscovered. It is a farther presumption in his favour, that many words in Greek and Latin, as well as in English, which have been called *conjunctions*, are obviously resolvable upon his principles, and indeed discover their meaning and origin upon mere inspection. We shall therefore content ourselves with retailing the common doctrine respecting these parts of speech so far as it is intelligible; subjoining at the bottom of the page the analysis given by Horne Tooke of the most important *English conjunctions and prepositions*; and requesting our readers, who would understand the subject, to attend more to the relations between their various ideas, than to the frivolous distinctions which, in compliance with custom, we are compelled to lay before them. We shall treat first of the *conjunction*.

SECT. I. Of CONJUNCTIONS.

115
Definition
of conjunc-
tions.

101. A *conjunction* is a part of speech of which, as its name indicates, the use is to connect either two or more words in a sentence, or to make of two simple sentences one compound sentence. It is usually said, that conjunctions never connect words, but sentences only; and that this is the circumstance which distinguishes them from *prepositions*. We have already given one example which proves this distinction to be ill founded; we shall now give from Horne Tooke one or two more, which will place its absurdity in a still clearer light: *Two AND two are four; John AND Jane are a handsome couple; AB and BC and CA form a triangle. Are two four? Is John a couple and Jane a couple? Does one straight line form a triangle?* From the subjoined note it appears, that AND (G) may connect any two things which can be connected, as it signifies *addition*.

116
Which are
either con-
junctive or
disjunctive.

Conjunctions connecting sentences, sometimes connect their meaning, and sometimes not. For example, let us take these two sentences, *Rome was enslaved, Cæsar was ambitious*, and connect them together by the conjunction *BECAUSE*; *Rome was enslaved BECAUSE Cæsar was ambitious*. Here the meanings, as well as the sentences, appear to be connected by that natural relation which subsists between an *effect* and its *cause*; for the enslaving of Rome was the *effect* of Cæsar's ambition. That particular relation therefore is that which is

denoted by the conjunction *BECAUSE* (H), which would be improperly used to connect two sentences between which the relation of an *effect* to its *cause* exists not. But if it be said, *manners must be reformed, OR liberty will be lost*; here the conjunction *OR*, though it join the sentences, yet as to their meaning is a perfect *disjunctive*. Between the *reformation of manners* and the *loss of liberty* there is certainly a *natural relation*; but it is not the relation of *contiguity* or *similitude*, or of *cause* and *effect*, but of *contrariety*. The relation of *contrariety* therefore is the signification of the word *OR* (I). And thus it appears, that though all conjunctions may combine sentences, yet, with respect to the *sense*, some are *CONJUNCTIVE* and others are *DISJUNCTIVE*.

117

Conjunctions either copulative or continuative.

102. Those *conjunctions* which conjoin both sentences and their meanings are either *COPULATIVES* or *CONTINUATIVES*. The principal copulative in *English* is *AND*, which we have already considered. The continuatives are much more numerous; *IF, AN, BECAUSE, THEREFORE, WHEREFORE, HENCE, &c.* The difference between them is this: The *copulative* does no more than barely couple words or sentences, and is therefore applicable to all subjects of which the natures are *not incompatible* (K). The relation which it denotes is that of *juxtaposition*, or of *one thing added to another*. *Continuatives*, on the contrary, by a more intimate connection, consolidate sentences into one continuous whole; and are therefore applicable only to subjects which have an *essential relation* to each other, such as that of an *effect* to its *cause* or of a *cause* to its *effect*. For example, it is no way improper to say, *Lyfippus was a statuary, AND Priscian a grammarian; the sun shineth, AND the sky is clear*; because these are things that may coexist, and yet imply no absurdity. But it would be absurd to say, *Lyfippus was a statuary BECAUSE Priscian was a grammarian*; though not to say, *the sun shineth BECAUSE the sky is clear*. With respect to the first, the reason is, that the word *BECAUSE* denotes the relation which an *effect* bears to its *cause*: but the skill of *Priscian* in grammar could not possibly be the *cause* of *Lyfippus's* skill in statuary; the coincidence between the skill of the one and that of the other, in arts so very different, was merely *accidental*. With respect to the shining of the sun and the clearness of the sky, the case is widely different; for the clearness of the sky is the *cause* of the sun's shining, at least so as to be seen by us.

118

Continuatives, either suppositive or positive.

As to the *continuatives*, they are either *SUPPOSITIVE*, such as *if, an*; or *POSITIVE*, such as *because, therefore, as, &c.* Take examples of each: *You will live happily IF you live honestly; you live happily BECAUSE you live honestly; you live honestly, THEREFORE you live happily*. The difference between these *continuatives* is this: The *suppositives* denote connection, but do not assert actual existence;

(G) *AND* is a Saxon word, being (according to Mr H. Tooke) an abbreviation of *ANAD*, the imperative of the verb *ANANAD*, to add to, or heap up. So that when we say *two AND two are four*, we only declare that *two ADDED TO two are four*.

(H) *BECAUSE* is compounded of the Saxon *BE*—by, and *cause*; and by some of our most ancient authors it was written *BY CAUSE*. *Rome was enslaved BECAUSE Cæsar was ambitious*, is therefore equivalent to, *Rome was enslaved by the cause CÆSAR WAS AMBITIOUS*; taking the phrase, *Cæsar was ambitious* as an abstract noun in concord with the other noun *cause*.

(I) *OR* seems to be a mere contraction of the Saxon *ODER*, which signifies *other*, i. e. something different and often *contrary*. So that the conjunction *or* must always denote *diversity*, and very often *contrariety*.

(K) As *day* and *night*, *heat* and *cold*: for we cannot say of the same portion of time, *it is day AND it is night*; or of the same body, *it is both hot AND cold*.

118
Positives,
either cau-
sal or col-
lective.

istence; the *positives* imply both the *one* and the *other* (L).

The *positives* above mentioned are either CAUSAL; such as, *because, since, as* (M), &c.: Or COLLECTIVE; such

No 142

as, *therefore, wherefore, &c.* The difference between these is this: The *causals* subjoin *causes* to *effects*; as, *the sun is in eclipse, BECAUSE the moon intervenes*: The *collectives* subjoin *effects* to *causes*; as, *the moon intervenes, THERE-*

(L) The reason of all this will be apparent from the analysis given by *Horne Tooke* of those words which we have called *suppositive* conjunctions. IF and AN may be used mutually and indifferently to supply each other's place; for they are both *verbs*, and of the same import. IF is merely the imperative of the *Gothic* and *Anglo-Saxon* verb GIFAN, *to give*; and in those languages, as well as in the English formerly, this *supposed* conjunction was pronounced and written as the common imperative GIF. Thus,

“ My largesse

“ Hath lotted her to be your brother's mistress,

“ GIF shee can be reclaimed; GIF not, his prey.” *Sad Shepherd, A& II. Scene 1st.*

Gawin Douglas almost always uses GIF for IF, as the common people in some counties of Scotland do even at this day; and it is obvious, that our IF has always the *signification* of the English imperative *give*, and no other. So that the resolution of the construction in the sentence, *If you live honestly you will live happily*, is simply this, *GIVE you live honestly* (taking *you live honestly* as an abstract noun) *you will live happily*. Your living *happily* is declared to depend upon your living *honestly* as the *condition*; but *give that*, and your happiness is positively asserted. In like manner may such sentences be resolved as,

“ I wonder he can move! that he's not fixed!

“ IF THAT his feelings be the same with mine.”

Thus, “ His feelings be the same with mine, *give that*, I wonder he can move,” &c. And here we cannot forbear giving our assent to the truth of Mr Tooke's observation, that when the *datum* upon which any conclusion depends is a *sentence*, the article THAT, if not expressed, *may* always be inserted. We do not, however, think the *insertion* at all times absolutely *necessary* to complete the syntax; for active verbs govern *whole sentences* and *clauses* of sentences as well as substantive *nouns*. Instances of this occur so frequently in the Latin classics, that they can have escaped no man's notice who has ever read *Horace* or *Virgil* with attention. We agree likewise with our most ingenious author, that where the *datum* is not a sentence, but some *noun* governed by the verb IF or GIVE, the article THAT can never be inserted. For example, if we be asked, how the weather will dispose of us to-morrow? we cannot say: “ IF THAT fair, it will send us abroad; IF THAT foul, it will keep us at home;” but “ IF fair, it will send us abroad,” &c. The reason is obvious: the verb in this case directly governs the noun; and the resolved construction is, “ GIVE fair weather, it will send us abroad; GIVE foul weather, it will keep us at home.”

AN, the other *suppositive* conjunction mentioned, is nothing else than the *imperative* of the Anglo-Saxon verb ANAN, which likewise means to *give* or to *grant*. As, “ AN you had an eye behind you, you might see more detraction at your heels than fortunes before you;” that is, “ GRANT you had an eye behind you, you might see,” &c. This account of the two *conditional* conjunctions in English is so rational and satisfactory, that we are strongly inclined to believe that all those words which are so called, are in all languages to be accounted for in the same manner. Not indeed that they must all mean precisely to *give* or *grant*, but some word equivalent; such as, *be it, suppose, allow, permit, &c.*; which meaning is to be sought for in the particular etymology of each respective language.

(M) Of the *causal* conjunctions mentioned in the text, BECAUSE has been already considered; and some account must be now given of the two words SINCE and AS. The former of these, according to Mr H. Tooke, is a very corrupt abbreviation, confounding together different words and different combinations of words. To us it appears to be compounded of SEAND, *seeing*; and ES, *that* or *it*; or of SIN, *seen*, and ES. SEAND and SIN are the *present* and *past* participles of the Anglo Saxon verb SEON, *to see*. In modern English SINCE is used four ways; *two* as a PREPOSITION affecting *words*, and *two* as a CONJUNCTION affecting *sentences*. When used as a preposition, it has always the signification of the past participle SEEN joined to THENCE (i. e. *seen and thenceforward*), or else the signification of the past participle SEEN only. When used as a conjunction, it has sometimes the signification of the *present* participle SEEING, or SEEING THAT; and sometimes the signification of the past participle SEEN, or SEEN THAT. We shall give examples of all these significations. 1st, As a *preposition* signifying SEEN and thenceforward: “ A more amiable sovereign than George III. has not swayed the English sceptre SINCE the conquest.” That is, “ The conquest seen (or at the completion of the sight of the conquest), and thenceforward, a more amiable sovereign than George III. has not swayed the English sceptre.” SINCE, taken in this sense, seems rather to be a corruption of SITHTHAN or SITHENCE, than a compound of SEAND and ES. 2dly, As a preposition signifying SEEN simply: “ Did George III. reign before or SINCE that example?” 3dly, As a conjunction, SINCE means *seeing that*: as, “ If I should labour for any other satisfaction but that of my own mind, it would be an effect of phrenzy in me, not of hope; SINCE (or *seeing that*) it is not truth but opinion that can travel through the world without a passport.” 4thly, It means SEEN THAT, or THAT SEEN; as, “ SINCE death in the end takes from all whatsoever fortune or force takes from any one, it were a foolish madness in the shipwreck of worldly things, when all sinks but the sorrow, to save that:” i. e.—“ Death in the end takes from all whatsoever fortune or force takes from any one; THAT SEEN, it were a foolish madness,” &c.

As, the other *causal* conjunction mentioned in the text, is an *article* meaning always IT, or THAT, or WHICH. Take the following example:

“ She glides away under the foamy seas

“ As swift AS darts or feather'd arrows fly.”

That

THEREFORE(N) *the sun is in eclipse*. We therefore use *causals* in those instances where, the effect being conspicuous, we seek for its cause; and *collectives*, in demonstration and science, properly so called, where the cause being first known, by its help we discern effects.

As to *causal* conjunctions, we may further observe, that there is no one of the four species of causes which they are not capable of denoting. For example, the *MATERIAL* cause; *The trumpet sounds BECAUSE it is made of metal*. The *FORMAL*; *The trumpet sounds BECAUSE it is long and hollow*. The *EFFICIENT*; *The trumpet sounds BECAUSE an artist blows it*. The *FINAL*; *The trumpet sounds THAT it may raise our courage*. It is worth observing, that the three first causes are expressed by the strongest affirmation; because if the effect actually be, these must be also. But this is not the case with respect to the last, which is only affirmed as a thing that may happen. The reason is obvious: for whatever may be the end which set the artist first to work, that end it may still be beyond his power to obtain; as, like all other contingents, it may either happen or not. Hence also it is connected by a particular conjunction, *THAT*(O), absolutely confined to this cause.

119
Causal conjunctions denote four kinds of causes.

120
Disjunctive conjunctions.

TIONS: a species of words which bear this contradictory name, because while they *CONJOIN* the sentences, they *DISJOIN* the sense; or, to speak a language more intelligible, they denote relations of *DIVERSITY* or *OPPOSITION*.

That there should be such words, whether called *conjunctions* or not, is extremely natural. For as there is a principle of *UNION* diffused through all things, by which *THIS WHOLE* is kept together and preserved from dissipation; so is there in like manner a principle of *DIVERSITY* diffused through all, the source of distinction, of number, and of order. Now it is to express in some degree the modifications of this diversity, that those words called *DISJUNCTIVE CONJUNCTIONS* are employed.

Of these *disjunctives*, some are *SIMPLE*, and some *ADVERSATIVE*: *Simple*; as when we say, *EITHER it is day or it is night*: *Adversative*; as when we say, *it is not day BUT it is night*. The difference between these is, that the *simple* expresses nothing more than a relation of *DIVERSITY*; the *adversative* expresses a relation not barely of diversity, but also of *OPPOSITION*. Add to this, that the *adversatives* are *DEFINITE*, the *simple* *INDEFINITE*. Thus when we say, *the number three is not an even number BUT(P) an odd*; we not only *disjoin* two opposite attributes, but we *definitely* affirm the one to belong to the

121

Either simple or adversative.

L

103. We come now to the *DISJUNCTIVE CONJUNCTIONS*. VOL. VIII. Part I.

That is, "She glides away (with) *THAT* swiftness (with) *WHICH* darts or feathered arrows fly." In German, where *AS* still retains its original signification and use, it is written *ES*. So is another conjunction of the same import with *AS*, being evidently the Gothic article *SA* or *SO*, which signifies *it* or *that*.

(N) As Mr Harris has called *THEREFORE*, *WHEREFORE*, &c. *collective conjunctions*, we have retained the denomination, though perhaps a more proper might be found. It is indeed of little consequence by what name any class of words be called, provided the import of the words themselves be understood. *WHEREFORE* and *THEREFORE* evidently denote the relation of a cause to its effects. They are compounds of the Saxon words *HWÆR* and *THÆR* with *FOR* or *VOOR*; and signify, *for which*, *for those* or *that*. It is worthy of remark, that in some parts of Scotland the common people even at this day use *THIR* for *these*.

(O) We have already considered the word *THAT*, and seen that it is never a conjunction, but uniformly a definite article. "The trumpet sounds (for) *THAT* it may raise our courage;" taking the clause *it may raise our courage* as an abstract noun in concord with *that* and governed by *for*. Or the sentence may be resolved thus: "The trumpet may raise our courage (for) *that* (purpose) it sounds."

(P) Mr Horne Tooke has favoured us with some ingenious remarks on the two different derivations of the word *BUT*, when used in the two acceptations that are usually annexed to it, viz. that which it bears in the beginning of a sentence, and that which it has in the middle. He has given it as his opinion, that this word, when employed in the former way, is corruptly put for *BOT*, the imperative of the Saxon verb *BOTAN*, *to boot*, *to superadd*, *to supply*, &c. and that when used in the latter it is a contraction of *BE-UTAN*, the imperative of *BEON-UTAN*, *to be out*. Our ancient writers made the proper distinction between the orthography of the one word and that of the other. Gawin Douglass in particular, although he frequently confounds the two words, and uses them improperly, does yet abound with many instances of their proper use; and so contrasted, as to awaken, says our author, the most inattentive reader. Of the many examples quoted by him, we shall content ourselves with the two following:

"*BOT* thy worke shall endure in laude and glorie,
"*BUT* spot or fault condigne eterne memorie."
—" *BOT* gif the fates, *BUT* pleid,
"*At my pleasure suffer it me life to leid.*"

Preface.

Book 4.

If this derivation of the word *BUT* from *BOTAN*, *to superadd*, be just, the sentence in the text, "the number three is not an even number *BUT* an odd," will be equivalent to, "the number three is not an even number, *superadd* (it is) an odd number;" and if so, the opposition is not marked (at least directly) by the word *BUT*, but by the adjectives *EVEN* and *ODD*, which denote attributes in their own nature opposite. It is only when *BUT* has this sense that it answers to *sed* in Latin, or to *mais* in French. In the second line of the quotation from Gawin Douglass's Preface, the word *BUT* is evidently a contraction of *BE-UTAN*, and has a sense very different from that of *BOT* in the preceding line. The meaning of the couplet is, "*SUPERADD* (to something said or supposed to be said before) thy work shall endure in laude and glorie, *BE OUT* (i. e. without) spot or fault, &c. In the following passage from *DONNE*, the word *BUT*, although written in the same manner, is used in both its meanings: "You must answer, that she was brought very near the fire, and as good as thrown in; or else, that she was provoked to it by a divine inspiration. *BUT* that another divine inspiration moved the beholders to believe that she did therein a noble act, this act of her's might have been calumniated." That is,

the *subject*, and *deny* the *other*. But when we say, *the number of the stars is EITHER (Q) even OR odd*; though we assert *one* attribute *to be*, and the *other not to be*, yet the alternative is notwithstanding left *indefinite*.

122
An improper distinction,

As to *adversative disjunctives*, it has been already said, after Mr Harris, that they imply *OPPOSITION*: but the truth seems to be, that they only *unite* in the same sentence *words* or *phrases* of opposite meanings. Now it is obvious, that *opposite attributes* cannot belong to the *same subject*: as when we say, *Nereus was beautiful*, we cannot *SUPERADD* to this sentence, that *he was ugly*; we cannot say, *he was beautiful BUT ugly*. When there is *opposition*, it must be either of the *same attribute* in *different subjects*; as when we say, "*Brutus was a patriot, BUT Caesar was not*:" Or of *different attributes* in the *same subject*; as when we say *Gorgius was a sophist, BUT not a philosopher*:" Or of *different attributes* in *different subjects*; as when we say, "*Plato was a philosopher, BUT Hippias was a sophist*." The conjunctions used for all these purposes have been called *absolute adversatives*, we think improperly, as the *opposition* is not marked by the *conjunctions*, but by the *words* or *sentences* which they serve to *connect*. Mr Locke, speaking of the word *BUT*, says, that "it sometimes intimates a *stop* of the mind, in the course it was going, before it came to the end of it:" to which Mr Tooke replies with truth, that *BUT* itself is the farthest of any word in the language from *intimating a stop*. On the contrary, it always imitates something to *follow*; inasmuch, that when any man in discourse finishes his words with *BUT*, instead of supposing him to have *stopped*, we always ask, *BUT what?*

Besides the adversatives already mentioned, there are two other species, of which the most important are UN-

LESS and ALTHOUGH. For example, "*Troy will be taken, UNLESS the palladium be preserved*; *Troy will be taken, ALTHOUGH Hector defend it*." The nature of these adversatives may be thus explained. As every *event* is naturally allied to its cause, so by parity of reason it is opposed to its *preventive*; and as every cause is either *adequate* or *inadequate* (inadequate when it endeavours without being effectual), so in like manner is every *preventive*. Now *adequate* preventives are expressed by such adversatives as *UNLESS*: "*Troy will be taken, UNLESS the palladium be preserved*;" that is, *this alone* is sufficient to *prevent* it. The *inadequate* are expressed by such adversatives as *ALTHOUGH*: "*Troy will be taken ALTHOUGH Hector defend it*;" that is, *Hector's defence* will prove *ineffectual*. These may be called adversatives *ADEQUATE* and *INADEQUATE*.

Such is the doctrine of Mr Harris; which although we can discover in it no determinate meaning, we have ventured with others to retail, in respect to our readers, who may be more perspicacious than ourselves. The author was a man of great learning; and the subject, as he has treated it, appears to be intricate. But whatever sense or nonsense there may be in what he says of *causes* and *preventives adequate* and *inadequate*, we have no hesitation to affirm that he has totally mistaken the import of the words *UNLESS* and *ALTHOUGH*. From these being called both *preventives*, the *one adequate* and the *other inadequate*, an unwary reader might be led to infer, that they denote the *same idea* or the *same relation*; and that the whole difference between them is, that the expression of the one is more forcible than that of the other. Nothing, however, can be farther than this from the truth. The meaning of *UNLESS* is directly opposite to that of *ALTHOUGH*. *UNLESS (R)* and *THOUGH* are

is, "You must answer, that she was brought very neare the fire, &c. "Superadd (to that answer) *BE OUT* (or *UNLESS* or *WITHOUT*; for, as will be seen by and bye, all those words are of the same import) that another divine inspiration moved," &c. To these remarks and examples it may be worth while to add, that even now *BUT* is often used by the illiterate Scotch for *WITHOUT*; as nothing is more common than to hear a clown say, "He came from home *BUT* his breakfast."

Having mentioned *WITHOUT* as a word of the same import with *BUT* when distinguished from *BOT*, it may not be improper to consider that word here; for though in modern English it is entirely confined to the office of a preposition, it was formerly used indifferently either as a *preposition* or a *conjunction*. *WITHOUT* then is nothing but the imperative *WYRTHAN-UTAN*, from the Anglo-Saxon and Gothic verb *WEORTHAN*, *WITHAN*; which in the Anglo-Saxon language is incorporated with the verb *BEON*, *esse*. According to this derivation, which is *Horne Tooke's*, the word *WITHOUT*, whether called conjunction or preposition, is the same as *BE OUT*; and such will be its import, should it after all be nothing more than a compound of *WYTH*, which signifies *to join* and sometimes *to be*, and *UTE*, *out*.

(Q) *EITHER* is nothing more than the distributive *pronoun*, which every body understands; and *OR* we have already explained.

(R) So low down as in the reign of queen Elizabeth (says *Horne Tooke*) this conjunction was sometimes written *oneles* or *onelesse*; but more anciently it was written *ONLES* and sometimes *ONLESSE*. Thus, in the trial of Sir John Oldcastle in 1413, "It was not possible for them to make whole Christes cote without seme, *ONLESSE* certeyn great men were brought out of the way." So, in "The image of governance" by Sir T. Eliot, 1541, "Men do fere to approche unto their soveregne Lord, *ONELES* they be called." So again, in "A necessary doctrine and erudition for any Christian man, set furthe by the kinge's majestie of England," 1543, "*ONLES* ye believe, ye shall not understande." "No man shall be crowned, *ONLES* he lawfully fight." "The soul waxeth feeble, *ONLESSE* the same be cherished." "It cannot begynne, *ONELESSE* by the grace of God." Now, *ONLES* is the imperative of the Anglo-Saxon verb *ONLESAN*, to *dismiss*; or *remove*.

LES, the imperative of *LESAN* (which has the same meaning as *ONLESAN*), is likewise used sometimes by old writers instead of *UNLESS*. Instances might be given in abundance from *G. Douglas* and *Ben. Johnson*; but perhaps it may be of more importance to remark, that it is this same imperative *LES*, which, placed at the end of nouns and coalescing with them, has given to our language such adjectives as *hopeless*, *restless*, *deathless*, *motionless*, &c. i. e. *dismiss* hope, rest, death, motion, &c.

Mr Tooke observes, that all the languages which have a conjunction corresponding to *LES* or *UNLESS*, as well

are both *verbs* in the *imperative mode*; the former signifying *take away* or *dismiss*; the latter, *allow*, *permit*, *grant*, *yield*, *assent*. This being the case, "*Troy will be taken UNLESS the palladium be preserved*," is a sentence equivalent to "*REMOVE the palladium be preserved* (taking *the palladium be preserved* as an abstract noun, *the preservation of the palladium*) *Troy will be taken*." Again, "*Troy will be taken, ALTHOUGH Hector defend it*," is the same as "*Troy will be taken ALLOW Hector (to) defend it*." The idea, therefore, expressed by *UNLESS* is that of the *REMOVAL* of one thing to make way for another; the idea expressed by *ALTHOUGH* (s) is that of *ALLOWING* one thing to *COEXIST* with another, with which it is *APPARENTLY incompatible*.

104. Before we take leave of this subject, we might treat, as others have treated, of *adverbial* conjunctions, and conjunctions (r) of various other denominations. But of multiplying subdivisions there is no end; and systems, in which they abound, convey for the most part no information. The nature of conjunctions can be thoroughly understood only by tracing each to its original in some parent or cognate tongue; and when that shall be done in other languages with as much suc-

cess as it has lately been done by Mr *Horne Tooke* in English, then, and not till then, may we hope to see a rational, comprehensive, and consistent theory of this part of speech. Then too shall we get rid of all that farrago of useless distinctions into *conjunctive*, *adjective*, *disjunctive*, *subdisjunctive*, *copulative*, *continuative*, *subcontinuative*, *positive*, *suppositive*, *causal*, *collective*, *preventive* *adequate* and *inadequate*, *adversative*, *conditional*, *illative*, &c. &c.; which explain nothing, and which serve only to veil ignorance and perplex sagacity.

That Mr *Tooke's* principles will apply exactly to the conjunctions of every language both dead and living, is what our limited knowledge of these languages does not authorise us positively to affirm. It is however a strong presumption in favour of his opinion, that illiterate savages, the first cultivators of language, are little likely to have sent out their faculties in quest of words to denote the *abstract relations* subsisting among their ideas, when we have such evidence as his book affords, that the names of the most *common substances* and *qualities* could answer *that* and every other purpose, which in the ordinary intercourse of life can be answered by the faculty of speech. It is a farther presumption in his

123
Which serves only to veil ignorance.

L 2

favour,

well as the manner in which the place of these words is supplied in the languages which have not a conjunction correspondent to them, strongly justify his derivation which we have adopted. The Greek *οὐκ*, the Latin *nisi*, the Italian *se non*, the Spanish *sino*, the French *si non*, all mean *be it not*. And in the same manner do we sometimes supply its place in English by *but*, *without*, *be it not*, *but if*, &c. It may be proper just to add, that, according to the same author, the conjunction *LEST* is a contraction of *LESED*, the past participle of *LESEN*; and that *LEST*, with the article *that*, either expressed or understood, means no more than *hoc dimisso* or *quo dimisso*.

(s) *ALTHOUGH* is compounded of *al* or *all*, and *THO'* *THOUGH*, *THAH*, or, as the vulgar more purely pronounce it, *THAF*, *THAUF*, and *THOF*. Now, *THAF* or *THAUF* is evidently the imperative *THAF* or *THAFIG* of the verb *THAFIAN* or *THAFIGAN*, to *allow*, *permit*, *grant*, *yield*, *assent*; and *THAFIG* becomes *thah*, *though*, *thoug* (and *thock*, as G. Douglas and other Scotch authors write it) by a transition of the same sort, and at least as easy as that by which *HAFUC* becomes *hawk*. It is no small confirmation of this etymology, that anciently they often used *all-be*, *albeit*, *all had*, *all were*, *all give*, instead of *ALTHOUGH*; and that as the Latin *si* (*if*) means *be it*, and *nisi* and *sine* (*unless* and *without*) mean *be not*, so *ETSI* (*although*) means *and be it*.

(r) In a work of this kind, which professes to treat of *universal* grammar, it would be impertinent to waste our own and our readers time on a minute analysis of each conjunction which may occur in any one particular language. We shall therefore pursue the subject no farther; but shall subjoin Mr *Horne Tooke's* table of the English conjunctions, referring those who are desirous of fuller satisfaction to his ingenious work intitled *The Diversions of Purley*.

IF	Are the Imperatives	GIF	Of their Respective Verbs	GIFAN	To give.
AN		AN		ANAN	To grant.
UNLESS		ONLES		ONLESAN	To dismiss.
EKE		EAC		EACAN	To add.
YET		GET		GETAN	To get.
STILL		STELL		STELLAN	To put.
ELSE		ALES		ALESAN	To diminish.
THOUGH		THAFIG		THAFIGAN	To allow.
OR		OR		OR	
THO'		THAF		THAFIAN	To boot, to superadd.
BUT		BOT		BOTAN	
BUT		BE-UTAN		BEON-UTAN	To be out.
WITHOUT		WYRTH-UTAN		WYRTHAN-UTAN	To be out.
AND		AN-AD		ANAN-AD	Dare congeriem.

LEST is the participle *LESED* of *LESAN*, to dismiss.

SINCE { *SITHTHAN*
SYNE
SEAND-ES
SITHTHE
or
SIN-ES } is the participle of *SEON*, to see.

THAT is the article or pronoun *THAT*.

As is *ES*, a German article, meaning *it*, *that*, or *which*. And

So is *SA* or *so*, a Gothic article of the same import with *as*.

favour, that in the rudest languages there are few if any conjunctions; and that even in others which are the most highly polished, such as *Greek* and *Latin* as well as *English*, many of those words which have been called conjunctions are obviously resolvable into other parts of speech. Thus *ΑΛΛΑ*, translated *but*, is evidently the neuter gender of either the *nominative* or *accusative plural* of *ἄλλος* *another*; and when used as a conjunction, it intimates that you are going to add something to what you have already said. *Caterum* has the same meaning, and is nothing but *καὶ ἕτερον*. *MAIS* (*but* in French) is the *Latin majus*; *ut*, *uti*, *ὅτι*, *quod*, is the *relative pronoun*. Of *quocirca*, *quia*, *præterea*, *antequam*, *quonquam*, *quemvis*, *quantumvis*, *quamlibet*, &c. the resolution is too obvious to require being mentioned. Where such resolutions as these can be made, or when the conjunctions of any particular tongue can be traced to their origin in any other, there needs be no dispute about their true import: but when the case is otherwise, and the conjunction either appears to be an original word, or is derived from a source to which it cannot be traced, we would advise such of our readers as wish to speak or write correctly, to dismiss from their minds all consideration of *copulatives*, *continuatives*, *causals* and *disjunctives*, with the rest of that jargon which we have already mentioned; and to inquire diligently in what manner and for what purpose the conjunction in question is used by the best writers, both ancient and modern, of the particular language which they are studying. This will indeed be found a work of labour: but it appears to us to be the only means left of discovering the precise relations which such conjunctions were intended to express; and, by consequence, of knowing what words or sentences they are fitted to connect, so as to produce a style at once accurate and perspicuous.

SECT. II. OF PREPOSITIONS.

124
The import of conjunctions in any language to be learned from the best authors ancient and modern.

105. By Mr HARRIS and his followers, a PREPOSITION is defined to be a part of speech devoid itself of signification, but so formed as to unite two words that are significant, and that refuse to coalesce or unite of themselves. We have already expressed our opinion of that theory which holds certain words to be devoid of signification; but its absurdity, in the present instance, is more than ever glaring. Concerning the number of prepositions, it is well known that hitherto authors have never agreed. The ancient Greek grammarians admitted only 18; the ancient Latin grammarians, above 50; though the moderns, *Sanctius*, *Scioppius*, *Perizonius*, *Vossius*, and *Ruddiman*, have endeavoured to lessen the number without fixing it. Bishop Wilkins thinks that 36 are sufficient; and Girard says, that the French language has done the business effectually with 32. But if prepositions be words devoid of signification, why should there be disputes respecting their number? or why in any language should there be more than one preposition, since a single unmeaning mark of connection would certainly answer the purpose as well as a thousand? The cypher, which has no value of itself, and only serves (if we may use the language of grammarians) to connote and consignify, and to change the value of figures, is not several and various, but uniformly one and the same. That "the preposition is so formed, as to unite two words which refuse to coalesce or unite of themselves," is indeed true; and this union it effects,

not by having no signification of its own, but by signifying the relation by which the things expressed by the united words are connected in nature. Prepositions are to be accounted for in much the same manner as the cases of nouns. The necessity of this species of words, or of some equivalent invention, follows from the impossibility of having in language a distinct complex term for each distinct collection of ideas which we may have occasion to put together in discourse. The addition or subtraction of any one idea, to or from a collection of ideas, makes it a different collection; and if, after either of these operations, it were to be expressed by the same word as before, nothing could ensue but misrepresentation and falsehood. Now, to use in language a different and distinct complex term for each different and distinct collection of ideas, is equally impossible, as to use a distinct particular term for each particular and individual idea. To supply, therefore, the place of the complex terms which are wanting in a language, are the cases of nouns and prepositions employed; by the aid of which, complex and general terms are prevented from being infinite or too numerous, and are used only for those collections of ideas which we have most frequent occasion to mention in discourse. By means of prepositions this end is obtained in the most simple manner. For, having occasion to mention a collection of ideas for which there is no single complex term in the language, we either take that complex term which includes the greatest number, though not all of the ideas we would communicate; or else we take that complex term which includes all, and the fewest ideas more than those we would communicate; and then, by the help of the preposition, we either make up the deficiency in the one case, or retrench the superfluity in the other. For instance, having occasion to mention a house of a particular description, and knowing that the term *house* is too general for our purpose, and that the building we have in view has no appropriate name, we say, perhaps, a house WITH a party-wall, or a house WITHOUT a roof.—In the first instance, the complex term *house* is deficient, and the preposition directs to add what is wanting.—In the second instance, the complex term is redundant, as it denotes a complete house; the preposition, therefore, directs to take away what is superfluous.

Now, considering prepositions in this the most simple light, as serving only to limit or modify general terms, it is absolutely necessary that they should have meanings of their own; for otherwise, how could we, in the instances before us, make known by them our intention, whether of adding to or retrenching from, the same general term *house*. If, to a disciple of Mr HARRIS, we should say, a house JOIN; he would reply, JOIN WHAT? But he would not contend that JOIN is an indeclinable word which has no meaning of its own, because he knows that it is the imperative of a verb, of which the other parts are still in use; and its own meaning is clear, though the sentence is not completed. If, instead of JOIN, we should say to him, a house WITH; he would still ask the same question, WITH what? But if we were to discourse with him concerning the word WITH, he would probably tell us, that WITH is a preposition, an indeclinable word, which is itself devoid of signification, but so formed as to unite two words that are significant. And yet it would be evident by his question, that he felt it had a meaning of its own; which

is in reality the same as JOIN (u). Indeed, so far has always been plainly perceived, that WITH and WITHOUT are directly opposite and contradictory; and it would puzzle the most acute philosopher to discover opposition and contradiction in two words where neither of them had any signification. Wilkins, therefore, has well expressed their meaning, where he says, that WITH is a preposition "relating to the notion of social, or circumstance of society AFFIRMED; and that WITHOUT is a preposition relating to the same notion of social, or circumstance of society DENIED."

127
They all
serve to
modify in
different
ways some
general
term or
general af-
firmation.

106. But to denote the relations of adding and taking away, are not the only purposes for which prepositions are employed. They all indeed serve to modify some general term or general affirmation, but not precisely in the same way as WITH and WITHOUT. It has been already observed, that words significant of those things which coincide in nature, coalesce with one another in syntax, without being beholden to any auxiliary tie. For instance, an adjective coalesces with its substantive, a verb with its nominative; a noun expressing an object acted upon, with a verb denoting action; and an adverb with its verb. Take the following example: THE SPLENDID SUN GENIALLY WARMETH THE FERTILE EARTH. But suppose we were desirous to modify this affirmation by the addition of other substantives, AIR, for instance, and BEAMS; how would these coincide with the other words of the sentence, or under what character could

they be introduced? Not as *nominatives* or *accusatives* to the verb, for both these places are already filled; the *nominative* by the substance SUN, which is certainly the *agent* in this operation; the *accusative* by the substance EARTH, which is as certainly the object acted upon. Not as *qualities* of the SUN and EARTH; for qualities inhering in their substances can only be expressed by *adjectives*, and the words *air* and *beams* are both *substantives*. Here then we must have recourse to prepositions; but we can employ only such prepositions as point out the *relations* which the AIR and the BEAMS have to the sun *warming the earth*. In English we should say, the splendid sun WITH his beams genially warmeth THROUGH the air the fertile earth. The sentence, as before, remains entire and one; the *substantives* required are both introduced; and not a word which was there before is detruded from its proper place. The import of WITH we have already discovered; it directs to UNITE the beams to the sun, as JOINTLY with him performing the operation. But the AIR has no other connection with this operation, than as the MEDIUM OF PASSAGE between the SUN and the EARTH: and therefore the preposition THROUGH (x) must denote that relation which subsists between an object in motion, and the medium in which it moves; nor could a preposition of a different import have been employed, without altering the meaning of the whole sentence (y).

107. Mr Harris is of opinion that most, if not all, pre-

(u) This account of prepositions is taken from *Horne Tooke*; who adds, that the only difference between the two words WITH and JOIN, is, that the other parts of the Gothic and Anglo-Saxon verb WITHAN, *to join* (of which WITH is the imperative), have ceased to be employed in the language. As WITH means *join*, so the correspondent French preposition AVEC means, *and have that*, or, *have that also*. But though WITH, as the imperative of WITHAN, means *join*, it has sometimes a very different signification. Mr *Tyrawhit* in his Glossary has truly observed, that WITH and BY are often synonymous. They certainly are so: but then WITH seems to be an abbreviation of the imperative of WYRTHAN, *to be*; as WITHOUT is of WYRTHAN-UTAN, *to be out*. This being the case, our two instances in the text will stand thus: a house JOIN a party wall; a house BE-OUT a roof. Nor let any one be surprised that we make no difference between the conjunction WITHOUT and the preposition WITHOUT. The word is the same, whether it be employed to unite words or sentences. Prepositions were originally, and for a long time, classed with conjunctions; and when first separated from them, they were only distinguished by the name of *prepositive conjunctions*. They are generally used to unite words, but not always; for we may say indifferently, I came after HIS DEPARTURE, or, I came after HE DEPARTED. By the greater part of grammarians indeed, AFTER, when employed as in the first sentence, is classed with the prepositions; when employed as in the second, it is classed with the conjunctions. The word, however, is the same in both sentences; its meaning is the same, and its effect precisely the same. The only circumstance of discrimination is, that in the first example it is prefixed to a noun, *his departure*; in the second, it is prefixed to a nominative and a verb, *he departed*. But even the nominative and the verb, thus applied, express no more than a specifying circumstance annexed to the other proposition, I came; and whenever they are rightly apprehended by the mind, they are stripped of their prepositional form, and considered abstractly under a new phasis, *his departure*. Thus then, the two sentences are synonymous in every respect, excepting the apparent grammatical nature of the words *his departure*, and *he departed*; and even these are reduced to one grammatic form in the mind, whenever the import of the propositions is rightly apprehended. WITHOUT, and many other prepositions, especially in the learned languages, are used exactly as AFTER is used in the two instances which we have given. *Horne Tooke* quotes Lord Mansfield for saying, "It cannot be read WITHOUT the Attorney General consents to it." This, in modern English, is not the common phraseology; but it offends not against any principle of grammar. The *nominative* and the *verb* are here, as in the former instance, considered as an *abstract noun*; "It cannot be read WITHOUT the consent of the Attorney General."

(x) THOROUGH, THOUROUGH, THOROW, THROUGH, or THRO', is no other, says *Horne Tooke*, than the Gothic substantive DAURO, or the Teutonic substantive THURUH, and, like them, means *door*, *gate*, *passage*. So that the sentence in the text, resolved upon his principles, stands thus: "The splendid sun—JOIN his beams—genially warmeth—PASSAGE the air, (or, the air being the *passage* or *medium*)—the fertile earth." And in the same manner may we translate the preposition *through* in every instance where *through* is used in English, or its equivalent preposition in any language; as from the Latin and Italian word *porta*, (in Spanish *puerta* and in French *porte*), have come the Latin and Italian preposition *per*, the French *par*, and the Spanish *por*.

(y) If, for instance, we were to substitute WITH or OF instead of THROUGH, we should in the one case alter the meaning,

128
Preposi-
tions ori-
ginally de-
noted the
various re-
lations of
body,

prepositions were originally formed to denote the *relations of PLACE*. For this opinion we see not sufficient evidence. If indeed we could suppose the *inventors* or *earliest improvers* of language to have at all concerned themselves with *relations* as *abstracted* from the *objects* related, we must believe that those which first attracted their attention were the *relations* subsisting among themselves, and the various bodies with which they were surrounded. We must likewise agree with our author, that *place* is the grand relation which *bodies* or *natural substances* maintain at all times to one another; but we do not therefore think that it would attract the *earliest* notice of untaught barbarians. On the contrary, we are of opinion that mankind must have made very considerable progress in science before they attempted to abstract *place* from *body*; an attempt which, according to some of the most profound philosophers (z), is not only difficult, but absolutely impracticable. But whatever be in this, the relations of *cause* and *effect*, of *duration* and *motion*, are in themselves as *obvious*, and as likely to *arrest* the *attention* and obtain *names*, as those of *place*. Among men totally illiterate they are evidently more so; for *pain* and *pleasure* would suggest some idea of cause and effect as *matters of importance*. There is, however, no probability that the inventors of any language had the least idea of *abstract relations*. They doubtless expressed *complex conceptions* by *nouns* and *verbs*, significant at once of the *particular ideas* and of the *various relations* by which they viewed those ideas as *combined together* in a *complex conception*. Afterwards, when mens minds became enlarged, and when, from the fluctuation inseparable from a living language, objects or ideas received new names, the old words, whether nouns or verbs, which were originally employed to express a *particular complex*

129
And were
at first ei-
ther verbs
or nouns.

conception, of which *certain particular RELATIONS* made a part, might be retained for the purpose of denoting *those* and *all similar RELATIONS*; and thus *verbs* and *nouns* would degenerate into *particles* bearing the names of *prepositions* and *conjunctions*. For instance, one *Anglo-Saxon* being desirous to communicate to another his own conception of a *house with a party-wall*, and having (we shall suppose) no such word in his tongue as a *preposition*, would naturally utter the word *house*, desiring his friend, at the same time, to add to that well known sound *another sound* (uttering it) significant of the particular circumstance wanting to complete his *complex conception*;—*A house WITH* (i. e. JOIN) *a party wall*. The word *WITH*, as the *imperative* of a *verb*, denotes of course *three ideas* combined together, viz. a *command* or *wish*, an *affirmation*, and the idea of *junction*. But when the verb *WITHAN* was dismissed from the English language, the imperative *WITH* was still retained; but losing its *verbal* and *modal* nature, it was thenceforth employed to denote only one of the *three ideas* for which it originally stood, viz. the idea of *junction*. And thus it is, that *verbs*, and also *nouns* and *adjectives*, in passing from one language to another, may become *prepositions* (A) and *conjunctions*. Thus too it is, that some of those *prepositions* come to denote the *contiguous*, and some the *detached*, relation of body. The *contiguous*, as when we say, *Caius walked WITH a staff*; i. e. *Caius, JOIN a staff, walked*; the *statue stood UPON* (B) *a pedestal*, i. e. *the statue stood* (the place of its standing) the *HIGHER PART* of a pedestal; the *river ran OVER a sand*, i. e. *the river ran* (the place of its running) the *HIGHER PART* of a sand. The *detached* relation, as when we say, *He is going TO* (C) *Italy*, i. e. *He is going, THE*

END

meaning, and in the other speak *nonsense*. “The sun warmeth *WITH* the air the fertile earth,” is an affirmation that *the sun warmeth BOTH THE AIR AND THE EARTH*; whereas the original sentence affirmed nothing more than that *he warmeth the EARTH*. “The sun warmeth *OF* the air the fertile earth,” is nonsense, as it makes the earth a *part*, or a *consequence*, of the air. So necessary is it that prepositions have a *meaning*, and that the meaning of each be attended to.

(z) The Bishops BERKELEY and LAW, with the very learned and ingenious Principal CAMPBELL of Aberdeen. See *The Principles of Human Knowledge*, LAW’s *Notes on KING’s Origin of Evil*, and *The Philosophy of Rhetoric*.

(A) As the Italian substantive CASA, a *house*, *race*, *family*, *nation*, &c. in passing to the French, becomes the preposition CHEZ, to which there is not, so far as we know, a preposition of precisely the same import in any language. SENZA or SENZE in Italian becomes SANS in French, and means *absence*. Nor is it necessary that *verbs* and *nouns* should always pass from one language to another, in order to be converted into *prepositions*: The Greek preposition χωρίς is evidently the corrupted imperative of χωρίζω, to *sever*, to *disjoin*, to *separate*. The Latin SINE is SIT NE, *be not*. The German SONDER is the imperative of SONDERN, which has the same meaning as χωρίζω.

(B) UP, UPON, OVER, BOVE, ABOVE, have all, says Horne Tooke, one common origin and signification. In the Anglo-Saxon, UFA, UFERA, UFEMÆST, are the *adjectives* ALTUS, ALTIOR, ALTISSIMUS. UFA or UFAN, *up*; comparative UFERA, OFERE or OFER, *over* or *upper*; superlative UFEMÆST, *upmost* or *uppermost*. BE-UFAN, BUFAN, ON-BUFAN, *bove*, *above*. If this be a just account of the origin of these words, the sentences in the text, where *upon*, *over*, and *above*, occur, will run thus: “The statue stood ON HIGH a pedestal;” “the river ran HIGHER a sand;” “the sun is risen ON HIGH the hills.” And here we may observe, that the mere relation between *standing*, *running*, &c. and *place*, is rather *inferred* from the *verb itself*, than *expressed* by a *separate word*; and the reason is obvious. For if a statue *stand*, every one knows that it must stand *on* some thing as well as *at* some time. There is therefore no *necessity*, whatever *elegance* there may be in it, for employing any word to denote that *relation*, which is commonly believed to be signified by *on*; but it is *necessary* to insert, between the *verb* and *pedestal*, a *word* significant of *place*, that *pedestal* may not be mistaken, by an ignorant person, for a *portion of time*, or any thing else connected with the *standing of the statue*.

(C) That *to* is significant of *detached* relation, is the language of Mr Harris, which, though it may be allowed in a loose and vulgar sense, is certainly not philosophically just. The preposition *to* (in Dutch written TOE and TOT) is the Gothic substantive; TAU or TAUTS signifying *act*, *effect*, *result*, or *consummation*; which Gothic substantive is itself no other than the past participle TAUID or TAUIDS of the verb TAUJAN *agere*. And

it

END (of his journey) *Italy*; the sun is risen ABOVE the hills, i. e. the sun is risen (the place) THE TOP of the hills; these figs came FROM Turkey, i. e. these figs came BEGINNING (their journey at) Turkey.

Besides the *detached* relation of body, Mr Harris is of opinion that the preposition FROM denotes two other relations not less different than those of *motion* and *rest*. Thus if we say, "That lamp hangs FROM the ceiling," the preposition FROM assumes a character of *quiescence*.

But if we say, "That lamp is falling FROM the ceiling," the preposition in such case assumes a character of *motion*." But this is evidently a mistake: the *detached* relation in the former instance of the figs, as well as the *motion* and *rest* in the present instances, are expressed not by the preposition, but by the verbs *came*, *falls*, *hangs*. The word *from* has as clear, as precise, and at all times as uniform and unequivocal a meaning, as any word in the language. FROM means merely BEGINNING, and nothing

it is obvious, that what is *done*, is *terminated*, *ended*, *finished*. In the Teutonic, this verb is written TUAN or TUON; whence the modern German THUN, and its preposition TU. In the Anglo-Saxon, the verb is TEOGAN, and the preposition TO. Do, the auxiliary verb, as it has been called, is derived from the same root, and is indeed the same word as TO. The difference between a T and a D is so very small, that an etymologist knows by the practice of languages, and an anatomist by the reason of that practice, that in the derivation of words it is scarce worth regarding. To support this etymon of TO, Mr Horne Tooke gives a similar instance in the Latin tongue. The preposition AD, he says, is merely the past participle of AGERE, which past participle is likewise employed as a Latin substantive. He exhibits the derivation of AD thus:

Agitum—agtum	{	AGDUM — AGD — AD
		or or or
		ACTUM — ACT — AT

The most superficial reader of Latin verse (he observes), knows how readily the Romans dropped their final *um*. And a little consideration of the organs and practice of speech will convince him how easily AGD or ACT would become AD or AT; as indeed this preposition was indifferently written either way by the ancients. By the later writers of Rome, the preposition was written AD with D only, in order to distinguish it from the other corrupt word called the *conjunction* AT; which for the same reason was written with the T only, though that likewise had anciently been written, as the *preposition*, either AD or AT. The preposition TO and the conjunction TOO in English, are both in *syntax* and in *meaning* used exactly as the preposition AD and the conjunction AT in Latin. From the specimens prefixed to Johnson's dictionary, as a history of our language, it appears that, as late as the reign of Elizabeth, the *preposition* and *conjunction* were both written with one O. And it has been shown in the first volume of the *Transactions of the Royal Society of Edinburgh*, that TO and TOO, as well as AD and AT, are precisely of the same import. The only difference, in either language, between the *preposition* and the *conjunction*, is, that the former *directs*, as a modification of some previous proposition, the addition of some *substantive* or *noun*; the latter, sometimes a *sentence* or *clause* of a sentence considered *abstractly* as a noun; and that, when the former is used, the proposition, to which the modifying circumstance is to be added, is *formally expressed*, but omitted when the latter is employed. Thus Denham says,

"Wisdom he has, and, TO his wisdom courage;

"Temper TO that, and, UNTO all, success."

In this example, every succeeding circumstance is by the preposition TO marked as an *addition* to the preceding. "Wisdom he has, and courage *additional* to his wisdom." But Denham might with equal propriety have omitted the object which TO governs, or to which it directs something to be *added*, though he must then, from the custom of the language, have employed the *conjunction* instead of the *preposition*. As,

"Wisdom he has, and courage too," &c.

This mode of expression would have been more concise, and as intelligible as the other, "Wisdom he has, and courage TO his wisdom," &c.

Not only is the object governed by TO omitted, when it is represented by a *substantive* in the context, but also when it is involved in a *proposition*; and then the conjunction, as it is called, is always used. Thus,

"——— Let those eyes that view

"The daring crime, behold the vengeance too."

So, "He made him prisoner, and killed him too." In the one example, the circumstance of *beholding the vengeance* is stated as an *addition* to the *viewing of the crime*; and in the other, the *killing him* is stated as an *addition* to the *making him a prisoner*. In both examples, the object governed by TOO is the amount of the preceding proposition taken *abstractly* as a noun or *substantive*. Thus then it appears, that TO and TOO, though classed the one with the prepositions, and the other with the conjunctions, are really one and the same word. The same is true of AD and AT. Thus, "AD hoc, promissa barba et capilli efferaverant speciem oris," signifies, "Additional to this, his long beard and hair had given a wildness to his aspect." But when the object governed by AD is not formally stated, AD itself is classed with the *conjunctions*, and written differently, AT. Thus Terence, "PH. Fac ita ut jussi, deducantur isti. PA. Faciam. PH. AT diligenter. PA. Fiet. PH. AT mature." By the means of AT, the circumstances of *diligence* and *haste* are *superadded* to the action commanded. "PH. It is not enough that you do it, you must do it carefully too. PA. Well, it shall be carefully done. PH. In good time too." AT, taken in this sense, is most commonly employed, like the English BUT, to mark the *unexpected union of incongruous objects*: As, "Aulam tyranni frequentabat, AT patriam amabat;" literally, "He frequented the court of the tyrant; joined EVEN TO that he loved his country." "He was a courtier and a patriot too." But if AD and AT in Latin, and TO and TOO in English, be derived from verbs which signify to DO or ACT, it may be asked how they come themselves to denote *addition*. The answer is obvious.

If

thing else. It is simply the *Anglo-Saxon* and *Gothic* noun *FRUM*, *beginning, origin, source, fountain, author* (v). Now if this meaning be applied to Mr Harris's instances, *FROM* will speak clearly for itself, without the assistance of the *interpreting* verbs, which are supposed by him to *vary its character*.

"These figs *came FROM* Turkey."

"That lamp *falls FROM* the cieling."

"That lamp *hangs FROM* the cieling."

Came is a complex term for one species of motion; *falls* is a complex term for another species of motion; and *hangs* is a complex (e) term for a species of attachment. Have we occasion to communicate or mention the COMMENCEMENT or BEGINNING of these motions, and of this attachment, and also the *place where* they commence or begin? To have complex terms for each occasion of this sort is absolutely impossible; and therefore nothing can be more natural or more simple than to add the signs of those ideas, viz. the word BEGINNING (which will remain always the same) and the NAME of the *place* (which will perpetually vary). Thus,

"These figs *came—BEGINNING* Turkey."

"That lamp *falls—BEGINNING* cieling."

"That lamp *hangs—BEGINNING* cieling."

That is,

"Turkey the *place* of BEGINNING to come."

"Cieling the *place* of BEGINNING to fall."

"Cieling the *place* of BEGINNING to hang."

It has been said by no less a man than bishop Wilkins, that *FROM* refers *primarily* to *place*, and *secondarily* to *time*. But the truth is, that *FROM* relates to every thing to which *beginning* relates, and to nothing else.

"From morn till night the eternal larum rang."

That is, "The larum rang BEGINNING morning (or morning being the *time* of its BEGINNING) till night."

As *FROM* always denotes *beginning*, so *TO* and *TILL* always denote the *end*. There is, however, this difference between them, that *TO* denotes the *end* of *any thing*; *TILL* the *end* only of *time*. We may say indifferently—"From morn *TO* night," or "from morn *TILL* night, the eternal larum rang;" but we cannot say—"These figs came from Turkey *TILL* England."

Nº 143.

That *TILL* can, with propriety, be opposed to *FROM* only when we are talking of *time*, is evident; for it is a word compounded of *TO* and *WHILE*, i. e. *time*. And as the coalescence of these two words *TO-HWILE*, took place in the language long before the present superfluous use of the article *THE*, the phrase—"From morn *TILL* night"—is neither more nor less than—*From morn TO TIME night*. When we say, "*from morn to night*," the word *TIME* is omitted as unnecessary.

Besides *FROM*, Mr Harris mentions *OVER* as significant, sometimes of *motion*, and sometimes of *rest*; and quotes, as instances, the two following passages from Milton.

———To support uneasy steps

OVER the burning marle.

Here, says he, *OVER* denotes *motion*. Again,

———He with looks of cordial love

Hung OVER her enamoured.

Here *OVER* denotes *rest*. But the truth is, that *OVER* denotes neither *motion* nor *rest* in either of the passages. In the first quotation, indeed, *MOTION* is implied: but it is implied in the word *STEPS*; and not in *OVER*, which denotes only that the *place* of the steps was the *top* of the burning marle. In the second quotation, *rest* is implied, and *that too* a particular *species* of *rest*; but it is implied or rather *expressed* by the verb *HUNG*, and *OVER* denotes the *place* of that species of *rest*.

108. But though the original use of prepositions was to denote the *relations of body*, they could not be confined to this office only. They by degrees extended themselves to subjects *incorporeal*; and came to denote relations, as well *intellectual* as *local*. Thus, because in place he, who is *above*, has commonly the advantage over him who is *below*; hence we transfer *OVER* and *UNDER* (f) to *dominion* and *obedience*. Of a king, we say, *he ruled OVER his people*; of a soldier, *he served UNDER his general*. So too we say, *with thought*; *without attention*; *thinking over a subject*; *under anxiety*; *from fear*; *through jealousy*, &c. All which instances, with many others of like kind, show, that the *first words* of men, like their *first ideas*, had an immediate reference to *sensible objects*; and that in after days, when they began to discern with their *intellect*, they took those words which they

130. They were by degrees extended to subjects incorporeal.

If a man should utter a sentence, and to the end of it subjoin the very general word *DO*, the person to whom he spoke, would naturally ask, *do what?* and this question would, of course, produce an *additional* sentence or clause of a sentence. Besides, it is to be observed, that *AGERE*, from which the Latin preposition is derived, as well as the Gothic verb, which is the source of the English particles, means not only *TO DO*, but also to *adduce* or *bring*; so that when we say, "he is going to Italy," we do nothing more than *affirm* that "he is going," and desire the person to whom we speak, to "ADD Italy to the journey."

From this derivation of the preposition *TO*, it will be seen at once upon what principle it is employed to mark the infinitive mode. In the learned languages that mode is generally known by its termination; but in English it would be impossible, without the aid of *TO* or of some other word significant of *action*, to distinguish the *verb love* from the *noun* or *substantive*.

(D) This derivation is Mr Horne Tooke's; and he supports it by the following sentence: *NE RÆDD GE SE THE ON FRUMMAN WORTHE, HE WORHTE WÆPMAN AND WIFMEN*; which is the Anglo-Saxon of St Matt. xix. 4. "Annon legistis, quod qui eos in principio creavit, creavit eos marem et feminam."

(E) These are complex terms because they are *verbs*. Each denotes an *affirmation* and *time*; and combined with these, *came* and *falls* denote *motion*, and *hangs* denotes *rest*.

(F) *UNDER* and *BENEATH*, though by the sound they seem to have little connection, are yet in fact almost the same word, and may very well supply each other's place. *UNDER* is nothing but *ON-NEDER*, and *BENEATH* is compounded of the imperative *BE* and the noun *NEATH*. *NEATH* uncompounded having slipped away from our language, would perhaps be unintelligible, had not the nouns *NETHER* and *NETHERMOST* still continued in common use. *NEATH*; Anglo-Saxon, *NEOTHAN*, *NEOTHE*; Dutch, *NEDEN*; Danish, *NED*; German, *NIEDRE*; and Swedish, *NEDRE* and *NEDER*; is undoubtedly as much a substantive, and has the same meaning, as the word *NADIR*. In common language it denotes the *bottom*.

they found *already* made, and transferred them by metaphor to *intellectual* conceptions.

Among the relations which may be considered rather as intellectual than corporeal, are those of *cause* and *consequence*; and for the denoting of these we have *two prepositions*, which sometimes appear in direct opposition to one another, and at other times may exchange places without injury to the sense.

"Well! 'tis e'en so! I have got the London disease they call love. I am sick *OF* my husband, and *FOR* my gallant."

Wycherley's Country Wife.

Here *OF* and *FOR* seem almost placed in opposition; at least their effects in the sentence appear to be very different; for, by the help of these two prepositions alone, and without the assistance of any other words, she expresses the two contrary affections of *loathing* and *desire*. The truth, however, is, that the author, if it had pleased him, might have used *OF* where he has employed *FOR*, and *FOR* where he has put *OF*. This is evident from the following quotation:

"Marian. Come, Amie, you'll go with us."

"Amie. I am not well."

"Lionel. She's sick *OF* the young shepherd that be-kist her."

Sad Shepherd.

In the same manner we may, with equal propriety, say—"We are sick *OF* hunger;" or—"We are sick *FOR* hunger." And in both cases we shall have expressed precisely the same thing, with only this difference, that, in the former sentence, we declare *sickness* to be a *CONSEQUENCE*; in the latter, we declare *hunger* to be a *CAUSE*. But to return to the *country wife*; that poor lady seems to have had a complication of distempers; she had, at least, two disorders—a sickness *OF* loathing, and a sickness *OF* love. She was sick *FOR* disgust, and sick *FOR* love. She was

Sick *OF* disgust *FOR* her husband;

Sick *OF* love *FOR* her gallant.

Sick *FOR* disgust *OF* her husband.

Sick *FOR* love *OF* her gallant.

In the first sentence, as thus stated, *sickness* is declared to be the *CONSEQUENCE* of *disgust*, of which *her husband* is declared to be the *CAUSE*. In the second, *sickness* is declared to be the *CONSEQUENCE* of love, of which *her gallant* is declared to be the *CAUSE*. In the third sentence, *DISGUST* is declared to be the *CAUSE* of *her sickness*, and the *CONSEQUENCE* of *OFFSPRING* of *her husband*. In the fourth, *love* is declared to be the *CAUSE* of *her sickness*, and the *CONSEQUENCE* of *OFFSPRING* of *her gallant*.

Thus, then, it appears, that though the *two first* of these sentences, taken entire, convey the very same meaning with the *two last*, yet the import of the preposition *FOR* is as different from that of *OF*, as *CAUSE* is from *CONSEQUENCE* (G). When two words or sentences are linked together by the *former* of these prepositions, the *object* expressed by the *last* word or sentence is declared to be the *CAUSE* of that which is expressed by the *preceding*; when two words or sentences are linked together

VOL. VIII. Part I.

ther by the *latter* preposition, the *object* expressed by the *first* word or sentence is declared to be the *CONSEQUENCE* OF, or to PROCEED FROM, the *object* expressed by the *second*. It is therefore a matter of perfect indifference to the sense, whether we say *sickness OF hunger*, or *sickness FOR hunger*; *The man, OF he speaks little, is wise*, or *the man is wise, FOR he speaks little*. By means of the preposition *OF*, we declare *sickness* to be the *CONSEQUENCE* proceeding from *hunger*, and *wisdom* to be the *CONSEQUENCE* we infer from the *man's speaking little*; by means of *FOR* we declare *hunger* to be the *CAUSE* of *sickness*, and the circumstance of *speaking little* to be the *CAUSE* from which we infer the *man's wisdom*. In the one sentence, *OF* is to be considered as a *noun* in *opposition* to *sickness*; in the other, as a *noun* in *opposition* to *the man is wise* taken *abstractly* as a *noun*. In the one sentence, *FOR* (i. e. *CAUSE*) is to be considered as a *noun* in *opposition* to *hunger*; in the other, as the *same noun* in *opposition* to *he speaks little*, taken *abstractly* as a *noun*.

109. In the foregoing use of prepositions, we have seen how they are applied by way of *juxta-position*; that is to say, where they are prefixed to a word without becoming a part of it. But they are used also by way of *composition*; that is, they are prefixed to other words so as to become real parts of them. Thus in *Greek* we have *επιστασθαι*; in *Latin*, *intelligere*; and in *English*, *UNDERstand*. So also, to *FOREtell*, to *OVERact*, to *UNDERvalue*, to *OUTgo*, &c.; and in *Greek* and *Latin* other instances innumerable. In this case the prepositions commonly transfuse something of their own meaning into the word with which they are compounded. For example, if we suppose some given space, *E* and *EX* signify *out of* that space; *PER*, *through* it; *IN*, *within* it; *SUB*, *under* it. Hence *E* and *PER*, in composition, augment: *Enormis* is something not simply big, but big in excess; something got *out of* the rule, and *beyond* the measure. *Dico*, "to speak;" *Edico*, "to speak out;" whence *Edictum* "an edict," something so effectually spoken as all are supposed to hear and all to obey.—On the contrary, *IN* and *SUB* diminish and lessen. *Injustus*, *INiquus*, "unjust, inequitable;" something that lies *within* justice and equity, that reaches not so far, that falls *short of* them. *Subniger*, "blackish;" *subrubicundus*, "reddish:" *tending* to black, and *tending* to red; but yet *under* the standard, and *below* perfection.

110. Before we dismiss this part of our subject, we shall make the same general remark on *prepositions* that we formerly made on *conjunctions*; viz. that the precise import of each can with certainty be known only by tracing it to its *source* in some word of *known* and *determinate* meaning, either in the language where the preposition itself has place, or in some parent or cognate tongue. And it may be laid down as an infallible rule, that where different languages use the same or a similar *particle*, that language ought to be considered as its legitimate parent, in which the true meaning of the word can be found, and where its use is as common and familiar as that of any other verbs and substantives.

(G) *Junius* derives *FOR* from the Greek *πρὸς*; *Skinner*, from the Latin *pro*; but I believe, says *Horne Tooke*, that it is no other than the Gothic substantive *FAIRINA*, "cause." He imagines also that *OF* (in the Gothic and Anglo-Saxon *AF*) is a fragment of the Gothic and Anglo-Saxon words *AFARA* and *AFORA*, *posteritas*, *proles*, &c. In a word, he considers *FOR* and *OF* as nouns or substantives; the former always meaning *cause*, the latter always meaning *consequence*, *offspring*, *successor*, *follower*, &c. If this account of these words be just, and we have no doubt of it, the prepositions *FOR* and *OF* are in syntax to be considered as nouns in *opposition* with other nouns, or with sentences taken *abstractly* as nouns.

stantives. When prepositions can be traced to such sources as these, no room can be left for disputes concerning their meaning. In carrying on this etymological pursuit, we find advantages in the nature of *prepositions* which *conjunctions* do not afford us. WITH and WITHOUT, FROM and TO, with many other words belonging to this class, have meanings directly opposite and contradictory to each other. If, then, by the total or partial extinction of an original language, the root of any one preposition be lost, whilst that of its opposite remains, the philosopher ought to be satisfied with reasoning from *contrariety*; as nothing is more evident, than that the meaning of a word is known when we know with precision the meaning of its opposite. When we meet, however, with a luckless preposition of which no root is left to be dug up, and which has itself no direct opposite in the language, nothing remains but that we inquire for what purpose it is used by the best writers both ancient and modern; and if we can fix upon *one meaning* which will apply, however awkwardly, to all the places where it occurs, or to the greater part of them, the probability is, that we have discovered the *true* and *original* (H) meaning of the preposition; and by keeping that meaning constantly in view, we shall ourselves be enabled to use the word with perspicuity and precision.

SECT. III. OF INTERJECTIONS.

134
The inter-
jection not
properly
any part of
speech.

III. Besides the above parts of speech, there is another acknowledged in all the languages of Europe, called the INTERJECTION; a word which cannot be comprehended under any of the foregoing classes. The *genuine interjections* are very few in number, and of very little importance, as they are thrown into a sentence without altering its *form* either in *syntax* or in *signification*. In the words of *Horne Tooke*, the brutish *inarticulate* interjection has nothing to do with speech, and is only the miserable refuge of the speechless. The dominion of speech, according to the same author, is erected on the downfall of *interjections*. Without the artful contrivances of language, mankind would have nothing but *interjections* with which to communicate orally any of their feelings. "The neighing of a horse, the lowing of a cow, the barking of a dog, the purring of a cat, sneezing, coughing, groaning, shrieking, and every other involuntary convulsion with oral sound, have almost as good a title to be called parts of speech as *interjections*. In the intercourse of language, *interjections* are employed only when the suddenness or vehemence of some affection or passion returns men to their natural state, and makes them for a moment forget the use of speech; or when, from some circumstance, the shortness of time will not permit them to exercise it." The genuine interjection, which is always expressive of some very strong sensation, such as AH! when we feel pain, does not owe its characteristi-

cal expression to the arbitrary form of articulation, but derives its whole force from the tone of voice and modification of countenance and gesture. Of consequence, these tones and gestures express the same meaning, without any relation to the articulation which they may assume; and are therefore universally understood by all mankind. *Voluntary interjections* are used in books only for embellishment, and to mark forcibly a strong emotion. But where speech can be employed, they are totally useless; and are always insufficient for the purpose of communicating thought. Dr Beattie ranks *strange, prodigious, amazing, wonderful, O dear, dear me, &c.* when used alone, and without apparent grammatical syntax, among the *interjections*: but he might with as much propriety have considered *hardly, truly, really*, and even many Latin *verbs*, as *interjections*; for these too are often used *alone* to supply the place of *whole sentences*. The truth is, that all men, when suddenly and violently agitated, have a strong tendency to shorten their discourse by employing a *single word* to express a *sentiment*. In such cases, the word employed, whether *noun, adjective, or verb*, would be the *principal* word of the sentence, if that sentence were completed; and the *agitation* of the speaker is such, and the *cause* of it so obvious, that the hearer is in no danger of mistaking the *sense*, and can himself supply the words that are wanting. Thus if a person, after listening to a romantic narrative, were to exclaim, *strange!* would any man of common sense suppose, that the word *strange*, because uttered alone, had lost the power of an *adjective* and become an *interjection*? No, surely: Every one sees, that the exclamation is equivalent to, *That is STRANGE*, or *That is a STRANGE story*. *Real interjections* are never employed to convey truth of any kind. They are not to be found amongst *laws*, in books of *civil institutions*, in *history*, or in any treatise of useful *arts or sciences*; but in *rhetoric* and *poetry*, in *novels, plays, and romances*, where in English, so far from giving *pathos* to the style, they have generally an effect that is disgusting or ridiculous.

HAVING now analysed *every part* of speech which can be necessary for the *communication of thought*, or which is acknowledged in any language with which we are acquainted; we shall dismiss the article of *Grammar*, after annexing a Table, which may present at one view the several *classes* and *subdivisions of words*. Of the different modes of dividing the parts of speech, as well as of the little importance of *systematic classifications*, we have already declared our decided opinion: but for the sake of those who may think differently from us, we shall in the annexed Table adopt Mr Harris's classification as far as it is intelligible; after informing our readers that Mr *Horne Tooke* admits only *three* parts of speech, the *article*, the *noun*, and the *verb*, and considers all other words as corruptions or abbreviations of the two last of these.

A GRAM-

(H) For instance, let us suppose that *Horne Tooke's* derivation of FOR, from the Gothic substantive FAIRINA, is fanciful and ill-founded; yet there can be little doubt but CAUSE is its true and original meaning, when it is found, that of sixteen examples brought by *Greenwood*, and forty-six by *Johnson*, of different significations of the word FOR, there is not one where the *noun* CAUSE may not be substituted instead of the *preposition* FOR; sometimes indeed awkwardly enough, but always *without injury* to the *sense*. Even where FOR seems to be *loco alterius*, which *Lowth* asserts to be its *primary sense*, it will be found to be CAUSE, and nothing else: Thus, *He made considerable progress in the study of the law before he quitted that profession FOR this of poetry*; i. e. *before he quitted that profession, this of poetry being the CAUSE of his quitting it*.

there are many mountains in the province, and some amongst all the losses they have sustained in Spain; they

which Lowth asserts to be its *primary sense*, it will be found to be *CAUSE*, and nothing else: Thus, He made considerable progress in the study of the law before he quitted that profession for this of poetry; i. e. before he quitted that profession, this of poetry being the *CAUSE* of his quitting it.

Gramma-
rian

Granada.

GRAMMARIAN, one that is skilled in or teaches grammar.

Anciently the name *grammarian* was a title of honour, literature, and erudition, being given to persons accounted learned in any art or faculty whatever. But it is otherwise now, being frequently used as a term of reproach, to signify a dry plodding person; employed about words and phrases, but inattentive to the true beauties of expression and delicacy of sentiment. The ancient grammarians, called also *philologists*, must not be confounded with the grammatists, whose sole business was to teach children the first elements of language. Varro, Cicero, Messala, and even Julius Cæsar, thought it no dishonour to be ranked grammarians, who had many privileges granted to them by the Roman emperors.

GRAMMONT, a town of France, in the Limosine, remarkable for its abbey, which is the chief of the order. E. Long. 133. N. Lat. 45. 56.

GRAMPIAN-HILLS; a chain of high mountains in Scotland, which run from east to west almost the whole breadth of the kingdom. See (*Scottish*) ALPS and SCOTLAND.—They take their name from only a single hill, the *Mons Grampius* of Tacitus, where Galgacus waited the approach of Agricola, and where the battle was fought so fatal to the brave Caledonians.

GRAMPOUND, a town of Cornwall in England, seated on the river Valle, over which there is here a bridge. W. Long. 5. 25. N. Lat. 50. 20. The inhabitants have a considerable manufacture of gloves; and the town sends two members to parliament. Some think that this town is the Voluba of the ancients, because it stands on the same river; and that on the building of the bridge, the name was changed into Grandpont. It was made a borough in the reign of Edward III. by whose charter it was endowed with large privileges, particularly freedom from toll through all Cornwall, a market on Saturday, and three fairs in the year; which the burgesses hold of the duchy of Cornwall in fee-farm, at the rent of about 12 guineas. Its privileges were confirmed by King Henry VIII. but it did not send members to parliament till the reign of Edward VI. It is a corporation with a mayor, 8 magistrates, a recorder, and town-clerk. The mayor is chosen annually the Tuesday before Michaelmas, and the members by the majority of the magistrates and freemen, who are such of the inhabitants as pay scot and lot. There is a chapel of ease in the town to the parish-church, which is at Creed, about a quarter of a mile off.

GRAMPUS, in ichthyology; a species of delphinus. See DELPHINUS.

GRANADA, a province of Spain, which for a long time was a kingdom distinct from the rest of that country. See the article SPAIN.—It made a part of the ancient Bætica; and was inhabited by the Bastuli, the Sexitani, &c. At present it is sometimes called Upper Andalusia. It is bounded to the south and east by the Mediterranean, to the west and north by Lower Andalusia, and to the north-east by Murcia. Its extent from west to east is two hundred and ten miles; but its greatest breadth exceeds not eighty. The air here is temperate and healthy; and though there are many mountains in the province, and some of them very high, yet they are almost every where

covered with vines and fruit-trees, together with laurel, myrtle, sweet-basil, thyme, lavender, marjoram, and other aromatic herbs, which give an exquisite taste to the flesh of their sheep and cattle. A great deal of silk and sugar, flax and hemp, honey and wax, is also produced here; besides dates and acorns, superior to the finest nuts; good stone for building; several sorts of gems; sumach, used in dressing goat-skins; and galls, of which a dye is made for leather. The valleys, with which the mountains are interspersed, are extremely beautiful and fertile. The inhabitants of some of the highest mountains are said to be descendants of the Moors; and, though they are become Roman-catholics, retain, in a great measure, their ancient customs, manners, and language. The principal rivers in the province are the Genil, or Xenil, and Gaudalantin, besides which there are many lesser streams. Abundance of salt is made in this province; which, though neither so populous nor so well cultivated as when subject to the Moors, yet is as much so as any in Spain. It was the last of the kingdoms possessed by the Moors, and was not reduced and annexed to the crown of Castile until 1492.

GRANADA, the capital of the above province, is situated at the foot of the Sierra Nevada, or the Snowy Mountain, in a wholesome air and fruitful country, an hundred and eighty miles south of Madrid, in W. Long. 2. 30. N. Lat. 36. 56. It stands upon two hills separated by the Darro. The Genil runs under the walls, and these two rivers are formed from the melting of the snow with which the mountain is constantly covered. The Darro is said to carry with it small particles of gold; and its name, derived from *dat aurum*, may be alleged as a proof of this: the Genil, in like manner, rolls with its stream little pieces of silver. When Charles V. came to Granada, in 1526, with the empress Isabella, the city presented him with a crown made of gold gathered from the Darro. The city is large and magnificent, containing a great number of very handsome public and private buildings. Its walls, which are adorned with many towers at equal distances, are said to be ten miles in compass. Here are two castles; the one built by the Moors, and the other by Charles V. and Philip II. They both command a very fine prospect; and the first is so large, that it looks like a city by itself, and, it is said, has room enough to accommodate forty thousand people, exclusive of the royal palace, and the convent of St Francis. Here is also a court of inquisition; a royal tribunal; and an university, founded in 1531; with the see of an archbishop, who has a revenue of forty thousand ducats per annum. A great many noblemen, clergymen, and wealthy citizens, reside in this city, of which the silk trade and manufacture is very great, and the arsenal is said to be the best furnished of any in Spain. The inhabitants, who are partly descended of the Moors, are well supplied with water. There are several fine squares, particularly that called the Bivaramba or Plaza Mayor, where the bull-fights are held; and without the city is a large plain, full of towns and villages, called La Vega de Granada.

The Moors are said to regret nothing but Granada, amongst all the losses they have sustained in Spain; they mention it in all their evening prayers, and supplicate

Granada.

Granada. heaven to restore it to their possession. The last Moorish ambassador who came into Spain obtained permission of the king to see Granada; he shed tears on entering the Alhambra, and could not refrain from exclaiming, that the folly of his ancestors had deprived them and their posterity of that delightful country.

Granada had formerly twenty gates: the first, that of Elvira, which still remains; the second, that of Bibalmazar, or of conference, because, with the Moors, it was a kind of place of resort where they conversed on affairs; the third, Vivarambla, so called from its leading to a grand square which still bears the same name; the fourth, Bib Racha, or of provisions; the fifth, Bitaubin, or the gate of the hermits, which led to different solitudes, the abodes of dervises; the sixth, Bibmitre, or Biblacha, the first gate; the seventh, the mill gate; the eighth, that of the sun, because it opened to the east; the ninth, the gate of the Alhambra, called by the Moors Bib Luxar; the tenth, Bid Adam, or the gate of the bones of Adam; the twelfth, Bib Ciedra, the gate of the nobles; the Moors kept this gate shut for a long time, because it had been predicted that the enemies which should one day take the city, would enter by that gate; the thirteenth, is that of Faxalauza, or of the hill of almond trees; the fourteenth, the lion gate, in Arabic, Bib Elecei; the fifteenth, the coast gate, called by the Moors Alacabar; the sixteenth, Bib Albonut, or the gate of the Banners, at present the magdalen gate; the seventeenth, that of the Darro; the eighteenth, that of the Mosayca; the nineteenth, that called the gate of *Ecce Homo*; the twentieth, that by the side of the Alhambra.

The Moors have left more monuments in Granada than in any other city in Spain. From the great number of inscriptions in and about the city, and the fine edifices of the Alhambra and the Generalif, it might be supposed these people intended to make Granada the great depository of their religion, manners, customs, and magnificence. There is not a wall which does not bear some marks of their power; but, notwithstanding this abundance of monuments, the reign of the Moors in Spain is still buried in confusion and obscurity. The ignorance of the Spaniards, their superstition, and the hatred they bore the Moors, have much contributed to this darkness; they have either destroyed, or suffered to be effaced by time, every thing which bore the mark of mahometanism, instead of preserving the monuments of antiquity, which at the same time were those of their own glory; and it may be said, that chance alone, and the solidity of their construction, much more than curiosity or a love of the arts, has preserved those which still exist, altho' daily going to ruin.

An account of the ALHAMBRA has been already given under its name in the order of the alphabet. From the hall of *Comares* there mentioned, there is a modern little stair-case; the old one, which corresponded to the beauty of the edifice, having been destroyed. At the top of the staircase is a gallery, a part of which is inclosed with an iron railing: this kind of cage is called the prison of the queen. It was here the wife of the last king of Granada was imprisoned. The Gomels and Legris, two families of distinction, bore false witness against her virtue, and occasioned the destruction of the greatest part of the Abencerrages, another

powerful and numerous family of Granada of whom they were jealous. The history of this event is given as follows.

In the year 1491, Abdali, surnamed the Little, still reigned in Granada; but this city was upon the brink of ruin, for the principal families were divided against each other. The Moors had carried their arms against Jaen, and had been bravely repulsed. Abdali was consoling himself in one of his pleasure houses for the ill success of his enterprise, when the Zegrís, who long had been the secret enemies of the Abencerrages, took the opportunity of this defeat to represent them to the king as rebellious subjects, who employed their immense riches to gain the favour of the people and dethrone their sovereign. They accused Albin Hamet, the most rich and powerful among them, of having an adulterous commerce with the queen, and produced witnesses who asserted they had on a certain festival seen, at Generalif, under a bower of rose trees, Albin Hamet in the arms of that princess. The fury of Abdali may easily be imagined; he swore the destruction of the Abencerrages. But the Zegrís, too prudent to let his anger break forth, advised him to dissimulate, and not to suffer it to be known to that numerous and powerful family that he was informed of their perfidy. It will be better, said they, to entice them into the snare, and, before they can unite and put themselves into a state of defence, revenge upon their heads the insult offered to the crown. This advice was followed: Abdali went to the Alhambra, having ordered thirty of his guards to arm themselves, and the executioner to attend. The Abencerrages were sent for one by one, and beheaded as soon as they entered the hall of the lions, where there is still a large vase of alabaster, which was quickly filled with blood and the heads of expiring bodies. Thirty-five heads had already been struck off, and all the Abencerrages would have died in the same manner, had not a page, who had followed his master, and remained unperceived in the hurry of the execution, taken an opportunity of withdrawing and giving information to the rest of the unhappy family of what had passed. These immediately assembled their friends in arms, crying out through the city of Granada, "Treason! treason! Let the king die! he unjustly puts to death the Abencerrages!" The people, with whom they were favourites, did not hesitate in assisting them: fourteen thousand men were soon found in arms, and immediately proceeded towards the Alhambra, shouting all the way, Let the king die! Abdali, surprised his secret should have been so soon discovered, and severely repenting of having followed the pernicious counsels he had received, ordered the castle gates to be shut; but they were presently set on fire. Muley Hacen, who had been forced to abdicate the throne in favour of his son, hearing the tumult of the people, had one gate opened, and presented himself to appease the rage of the citizens; but he no sooner appeared, than he was lifted up by the multitude nearest the gate, who cried out, "Behold our king, we will have no other, long live Muley Hacen;" and leaving him surrounded by a strong guard, the Abencerrages, and other nobles, entered the castle, accompanied by upwards of an hundred soldiers. But they found the queen only, with her women, and in the utmost consternation at the sudden

Granada sudden revolution, of which she knew not the cause. They asked for the king; and being informed he was in the hall of the lions, entered it furiously, and found him defended by the Zegris and the Gomels, and in less than two hours killed upwards of two hundred of them. Abdali had the good fortune to escape. The bodies of the beheaded Abencerrages were laid upon black cloth, and carried to the city. Muza, brother to Abdali, and who by his great actions had gained the favour of the people, seeing the Abencerrages were revenged, found means to appease them; and having learned that the king had taken refuge in a mosque near the mountain now called Saint Helena, went and brought him back to the castle of the Alhambra. For several days nothing but sighs and groans were throughout the city. Abdali shut himself up in the castle, and refused to see the queen. Those who had accused her of adultery, however, persisted in their false accusation, and said, they would maintain, with arms in their hands, against all who should contradict them, that the queen was guilty. The unhappy princess was imprisoned, and the day arriving on which she was to perish by the hands of the executioner, when none among the Moors offering to defend her, she was advised to commit her cause to some Christian knights, who presented themselves at the time appointed, and conquered her false accusers, so that she was immediately set at liberty. The taking of Granada soon followed this combat; Muza and the Abencerrages having, it is said, facilitated the conquest of it by Ferdinand and Isabella.

From the Alhambra you enter the Generalif by a low gate, which favoured the escape of Abdali when Ferdinand took Granada. Generalif is said to signify, in Arabic, the house of love, of dance, and pleasure. It was built by a prince of the name of Omar, who was so fond of music, that he retired to this palace, entirely to give himself up to that amusement. The Generalif is the most pleasing situation in the environs of Granada. It is built upon a very high mountain whence waters rush from every side, which escape in torrents, and fall in beautiful cascades in the courts, gardens, and halls of that ancient palace. The gardens form an amphitheatre, and are full of trees, venerable from their antiquity. Two cypresses in particular are noted, called the Cypresses of the queen, because it was near them the perfidious Gomel impeached the virtue of that princess and the honour of the Abencerrages. Of this place, travellers observe, that the writers of romances have never imagined a scene equal to it.

Granada was formerly called *Illiberia*, and founded, if we will believe some writers, by *Liberia*, a great grand-daughter of Hercules, daughter of Hispan, and wife to Hesperus, a Grecian prince, and brother to Atalanta. Others, who support their assertions by proofs to the full as satisfactory, maintain that it was founded by Iberus, grandson of Tubal, and that it took the name of Granada, or Garnata, from Nata the daughter of Liberia; this word being composed of *Gar* (which in the language of the time signified grotto) and *Nata*; that is, "the grotto of Nata," because that princess studied astrology and natural history, and delighted in the country. It is certain that such a person as Nata, or Natayde, existed in the first ages of

the foundation of Granada; and that in the place where the Alhambra now stands, there was a temple dedicated to Nativala. The date of the foundation of Granada is said to be 2808 years before Christ. We know that in the time of the Romans it was a municipal colony.—A description in Latin of Granada, such as it was, in 1560, written by a merchant at Antwerp, named George Hofnahel, who travelled into Spain, is to be found in the work, intitled *Civitates orbis terrarum*, printed at Cologne in 1576. This book also contains a good plan of the city of Granada.

GRANADA, or GRENADA, one of the Caribbee islands. See GRENADA.

GRANADA, a town of America, in the province of Nicaragua, and in the audience of Guatimala, seated on the lake Nicaragua, 70 miles from the S. Sea. It was taken twice by the French buccaneers, and pillaged. The inhabitants carry on a great trade by means of the lake, which communicates with the N. Sea. W. Long. 85. 10. N. Lat. 11. 8.

GRANADA, NEW, a province of South America, in Terra Firma, about 75 miles in length, and as much in breadth. It is bounded on the north by Carthagena and St. Martha, on the east by Venezuela, on the south by Popayan, and on the west by Darien. It contains mines of gold, copper, and iron; horses, mules, good pastures, corn, and fruits. It belongs to the Spaniards, and Santa-Fe-de-Bagota is the capital town.

GRANADILLOES, the name of some islands of the Caribbees, in America, having St Vincent to the north and Granada to the south. They are so inconsiderable that they are quite neglected; but were ceded to England by the treaty of peace in 1763.

GRANADIER, a soldier armed with a sword, a firelock, a bayonet, and a pouch full of hand-granadoes. They wear high caps, are generally the tallest and briskest fellows, and are always the first upon all attacks.

Every battalion of foot has generally a company of granadiers belonging to it; or else four or five granadiers belong to each company of the battalion, which, on occasion, are drawn out, and form a company of themselves. These always take the right of the battalion.

GRANADO or GRENADE, in the art of war, a hollow ball or shell of iron or other metal, of about 2½ inches diameter, which being filled with fine powder, is set on fire by means of a small fuse driven into the fuse-hole, made of well-seasoned beech-wood, and thrown by the grenadiers into those places where the men stand thick, particularly into the trenches and other lodgements made by the enemy. As soon as the composition within the fuse gets to the powder in the grenado, it bursts into many pieces, greatly to the damage of all who happen to be in its way. Granadoes were invented about the year 1594. The author of the Military Dictionary has the following remark on the use of granadoes. "Grenades have unaccountably sunk into disuse; but I am persuaded there is nothing more proper than to have grenades to throw among the enemy who have jumped into the ditch. During the siege of Cassel under the Count de La Lippe, in the campaign of 1762, a young engineer

Granard,
Granary.

undertook to carry one of the outworks with a much smaller detachment than one which had been repulsed, and succeeded with ease from the use of grenades; which is a proof that they should not be neglected, either in the attack or defence of posts."—The word Granado takes its rise from hence, that the shell is filled with grains of powder, as a pomegranate is with kernels.

GRANARD, a borough, market, fair, and post town in the county of Longford, province of Leinster; it gives title of earl to the family of Forbes; situated 52 miles from Dublin, and about 16 north east of Longford. N. Lat. 53. 44. W. Long. 7. 30. Here is a remarkable hill or mount, called the *Moat of Granard*, thought to be artificial, and the site of a Danish castle or fort; which commands from its summit a most extensive prospect into six or seven adjoining counties. In this town have lately been given annual prizes to the best performers on the Irish harp. Granard has a barrack for a company of foot; and returns two members to parliament; patronage in the families of Macartney and Greville. Fairs held 3d May and 1st October. This place takes its name from *Grianard*, or "the height of the sun", and was formerly the residence of the chiefs of north Teffia. It is sometimes written Grenard.

GRANARY, a building to lay or store corn in, especially that designed to be kept a considerable time.

Sir Henry Wotton advises to make it look towards the north, because that quarter is the coolest and most temperate. Mr Worlidge observes, that the best granaries are built of brick, with quarters of timber wrought in the inside, to which the boards may be nailed, with which the inside of the granary must be lined so close to the bricks, that there may not be any room left for vermin to shelter themselves. There may be many stories one above another, which should be near the one to the other; because the shallower the corn lies, it is the better, and more easily turned.

The two great cautions to be observed in the erecting of granaries are, to make them sufficiently strong, and to expose them to the most drying winds. The ordering of the corn in many parts of England, particularly in Kent, is thus: To separate it from dust and other impurities after it is thrashed, they toss it with shovels from one end to the other of a long and large room; the lighter substances fall down in the middle of the room, and the corn only is carried from side to side, or end to end of it. After this they screen the corn, and then bringing it into the granaries, it is spread about half a foot thick, and turned from time to time about twice in a week; once a week they also repeat the screening it. This sort of management they continue about two months, and after that they lay it a foot thick for two months more; and in this time they turn it once a week, or twice if the season be damp, and now and then screen it again. After about five or six months they raise it to two feet thickness in the heaps, and then they turn it once or twice in a month, and screen it now and then. After a year, they lay it two and a half or three feet deep, and turn it once in three weeks or a month, and screen it proportionably. When it has lain two years or more, they turn it once in two months, and screen it once a quarter; and how long soever it is kept, the oftener the turn-

ing and screening is repeated, the better the grain will be found to keep.—It is proper to leave an area of a yard wide on every side of the heap of corn, and other empty spaces, into which they turn and toss the corn as often as they find occasion. In Kent they make two square holes at each end of the floor, and one round in the middle, by means of which they throw the corn out of the upper into the lower rooms, and so up again, to turn and air it the better. Their screens are made with two partitions, to separate the dust from the corn, which falls into a bag, and when sufficiently full this is thrown away, the pure and good corn remaining behind. Corn has by these means been kept in our granaries 30 years; and it is observed, that the longer it is kept the more flour it yields in proportion to the corn, and the purer and whiter the bread is, the superfluous humidity only evaporating in the keeping. At Zurich in Switzerland, they keep corn 80 years, or longer, by the same sort of methods.

The public granaries at Dantzick are seven, eight, or nine stories high, having a funnel in the midst of every floor to let down the corn from one to another. They are built so securely, that though every way surrounded with water the corn contracts no damp, and the vessels have the convenience of coming up to the walls for their lading. The Russians preserve their corn in subterranean granaries of the figure of a sugar-loaf, wide below and narrow at top: the sides are well plastered, and the top covered with stones. They are very careful to have the corn well dried before it is laid into these storehouses, and often dry it by means of ovens; the summer dry weather being too short to effect it sufficiently.—Dantzick is the grand storehouse or repository of all the fruitful kingdom of Poland. The wheat, barley, and rye, of a great part of the country, are there laid up in parcels of 20, 30, or 60 lasts in a chamber, according to the size of the room; and this they keep turning every day or two, to keep it sweet and fit for shipping. A thunder storm has sometimes been of very terrible consequences to these stores. All the corn of the growth of former years having been found so much altered by one night's thunder, that though over night it was dry, fit for shipping or keeping, and proper for uses of any sort, yet in the morning it was found clammy and sticking. In this case there is no remedy but the turning of all such corn three or four times a day for two months or longer; in which time it will sometimes come to itself, though sometimes not. This effect of thunder and lightning is only observed to take place in such corn as is not a year old, or has not sweated thoroughly in the straw before it was threshed out. The latter inconvenience is easily prevented by a timely care; but as to the former, all that can be done is carefully to examine all stores of the last year's corn after every thunder storm, that if any of this have been so affected, it may be cured in time; for a neglect of turning will certainly utterly destroy it.

According to Vitruvius's rules, a granary should always be at the top of a house, and have its openings only to the north or east, that the corn may not be exposed to the damp winds from the south and west, which are very destructive to it; whereas the contrary ones are very necessary and wholesome to it, serving

to

Granary.

Granary.

to cool and dry it from all external humidity, from whatever cause. There must also be openings in the roof to be set open in dry weather, partly to let in fresh air, and partly to let out the warm effluvia which are often emitted by the corn. The covering of the roofs should always be of tiles, because in the worst seasons, when the other openings cannot be safe, there will always be a considerable inlet for fresh air, and a way out for the vapours by their joinings, which are never close. If there happen to be any windows to the south, great care must be taken to shut them up in moist weather, and in the time of the hot southern winds. There must never be a cellar, or any other damp place under a granary, nor should it ever be built over stables; for in either of these cases the corn will certainly suffer by the vapours, and be made damp in one, and ill-tasted in the other.

M. Du Hamel and Dr Hales recommend various contrivances for ventilating or blowing fresh air through corn laid up in granaries or ships, in order to preserve it sweet and dry, and to prevent its being devoured by weevils or other insects. This may be done by nailing wooden bars or laths on the floor of the granary about an inch distant from each other, when they are covered with hair-cloth only; or at the distance of two or three inches, when coarse wire-work, or basket-work of osier is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. These laths may be laid across other laths, nailed at the distance of 15 inches, and two or more deep, that there may be a free passage for the air under them. The under laths must come about six inches short of the wall of the granary at one end of them; on which end a board is to be set edgewise, and sloping against the wall: by this disposition a large air-pipe is formed, which having an open communication with all the interstices between and under the bars, will admit the passage of air below forcibly through a hole at the extremity of it, into all the corn in the granary, that will consequently carry off the moist exhalations of the corn. The ventilators for supplying fresh air may be fixed against the wall, on the inside or outside of the granary, or under the floor, or in the ceiling; but wherever they are fixed, the handle of the lever that works them must be out of the granary, otherwise the person who works them would be in danger of suffocation, when the corn is fumed with burning brimstone, as is sometimes done for destroying weevils. Small moveable ventilators will answer the purpose for ventilating corn in large bins in granaries, and may be easily moved from one bin to another. If the granary or corn ship be very long, the main air-pipe may pass lengthwise along the middle of it, and convey air, on both sides, under the corn. In large granaries, large double ventilators, laid on each other, may be fixed at the middle and near the top of the granary, that they may be worked by a wind-mill fixed on the roof of the building, or by a water-mill. The air is to be conveyed from the ventilators through a large trunk or trunks, reaching down through the several floors to the bottom of the granary, with branching trunks to each floor, by means of which the air may be made to pass into a large trunk along the adjoining cross walls: from these trunks several lesser trunks, about four inches wide, are to branch off, at the distance of three or

four feet from each other, which are to reach through the whole length of the granary, and their farther ends are to be closed: seams of $\frac{1}{16}$ or $\frac{1}{8}$ of an inch are to be left open at the four joinings of the boards, where they are nailed together, that the air may pass through them into the corn. In some of these lesser trunks there may be sliding shutters, in order to stop the passage of the air through those trunks which are not covered with corn; or to ventilate one part of the granary more briskly than others, as there may be occasion. There must also be wooden shutters, hung on hinges at their upper part, so as to shut close of themselves; these must be fixed to the openings in the walls of the granary on their outside: by these means they will readily open to give a free passage for the ventilating air, which ascends through the corn, to pass off, but will instantly shut when the ventilation ceases, and thereby prevent any dampness of the external air from entering: to prevent this, the ventilation should be made only in the middle of dry days, unless the corn, when first put in, is cold and damp.

In lesser granaries, where the ventilators must be worked by hand, if these granaries stand on staddles, so as to have their lowest floor at some distance from the ground, the ventilators may be fixed under the lowest floor, between the staddles, so as to be worked by men standing on the ground, without or within the granary. A very commodious and cheap ventilator may be made for small granaries, by making a ventilator of the door of the granary; which may be easily done by making a circular screen, of the size of a quarter of a circle, behind the door: but in order to this, the door must be open, not inwards but outwards of the granary, so that as it falls back, it may be worked to and fro in the screen; which must be exactly adapted to it in all parts of the circular side of the screen, as well as at the top and bottom. But there must be a stop at about eight or ten inches distance from the wall, to prevent the door's falling back farther; that there may be room for a valve in the screen to supply it with air; which air will be driven in by the door, through a hole made in the wall near the floor, into the main air-trunk, in which there must be another valve over the hole in the wall, to prevent the return of the air.

To destroy weevils and other insects with which GRANARIES are apt to be infested.—The preservation of grain from the ravages of insects may be best effected by timely and frequent screening, and ventilation; as little or no inconvenience will follow corn or malt lodged dry, but what evidently results from a neglect of these precautions. For, whether the obvious damage arise from the weevil, the moth, or the beetle, that damage has ceased at the time the vermin make their appearance under either of these species, they being, when in this last state of existence, only propagators of their respective kinds of vermiculi; which, while they continue in that form, do the mischief.

In this last, or insect state, they eat little, their principal business being to deposit their ova (eggs), which unerring instinct prompts them to do where large collections of grain furnish food for their successors while in a vermicular state. It is therefore the business of industry to prevent future generations of these ravagers, by destroying the eggs previous to their hatching; and this

Granary.

Granary. this is best accomplished by frequent screening, and exposure to draughts of wind or fresh air. By frequently stirring the grain, the cohesion of their ova is broken, and the nidus of those minute worms is destroyed, which on hatching collect together, and spin or weave numerous nests of a cobweb-like substance for their security. To these nests they attach, by an infinity of small threads, many grains of corn together, first for their protection, and then for their food. When their habitations are broken and separated by the screen, they fall through its small interstices, and may be easily removed from the granary with the dust. Those that escape an early screening will be destroyed by subsequent ones, while the grain is but little injured; and the corn will acquire thereby a superior purity. But by inattention to this, and sometimes by receiving grain already infected into the granary, these vermin, particularly the weevil, will in a short time spread themselves in that state every where upon its surface, and darken even the walls by their number. Under such circumstances a hen or hens, with new hatched chickens, if turned on the heap, will traverse, without feeding (or very sparingly so) on the corn, wherever they spread; and are seemingly insatiable in the pursuit of these insects. When the numbers are reduced within reach, a hen will fly up against the walls, and brush them down with her wings, while her chickens seize them with the greatest avidity. This being repeated as often as they want food, the whole species will in a day or two be destroyed. Of the phalæna (moth), and the small beetle, they seem equally voracious: on which account they may be deemed the most useful instruments in nature for eradicating these noxious and destructive vermin.

GRANATE, or GARNET: a genus of fossils ranked among the siliceous earths; but, according to M. Magellan, analogous to gems, all of them being composed of the siliceous, argillaceous and calcareous earths, with a greater or less proportion of iron. The opaque and black garnets contain about a fifth part of iron; but the diaphanous ones only $\frac{1}{5}$ th, according to Bergman. The garnets, properly so called, contain a greater quantity of siliceous earth than the shirls, and both are now justly ranked with the siliceous earths. The general properties of the garnet, according to Cronstedt, are as follow: 1. It is more fusible as it contains less metallic matter, and is more transparent or glassy in its texture. 2. Mixed with salt of kelp, it may, on a piece of charcoal, be converted into glass by the blow-pipe, which cannot be done with flint. 3. The most transparent garnet may, without any addition, be brought to a black opaque slag by the same means. 4. It is never, as far as is hitherto known, found pure, or without some mixture of metal, especially iron, which may be extracted by the common methods. 5. The garnet matter, during the crystallization, has either been formed in small detached quantities, or else has had the power of shooting into crystals, though closely confined in different substances: since garnets are generally found dispersed in other solid stones, and oftentimes in the harder ones, such as quartz and chert. Fabroni informs us, that the garnet is easily melted by means of borax or the vegetable alkali. Its specific gravity is greater than that of the precious stones; viz. from 3600, and even from 4400

to 5000. According to Brunich, most of the garnets strike fire with steel.

Cronstedt observes, that the metallic calces, when mixed with other earthy substances, make great alteration in their fusibility; iron, for instance, in the argillaceous and micaceous earths, renders them fusible, tho' otherwise they are not so. Hence there may be some reasons for considering the garnet as a quartz impregnated with iron; yet on the whole he thinks it will be better to call the garnet a stone of a different order, until we have experiments sufficient to warrant us to reduce the number of earths. The garnet earth is never found but in an indurated state; and is divided into the garnet properly so called, and shirl or cockle; though this perhaps is owing more to the figure of their crystals than any thing else. The species are,

1. The granatus, or coarse-grained garnet; a heavy hard stone, crystallizing in form of polygonal balls, mostly of a red or reddish brown colour. It is found of a reddish brown and whitish or pale yellow, in different parts of Sweden.

2. The granatus crystallizatus, or crystallized garnet, is reckoned among the precious stones, but varying in its colour and form of its crystal more than any of them. Sometimes it is of a deep and dark red colour; sometimes yellowish or purplish; sometimes brown, black, or opaque. It is inferior both in lustre and hardness to the other gems, yielding to the file, although it will strike fire with steel. The crystals are sometimes irregular, but frequently assume rhomboidal, tetradecahedral, and almost all other regular forms.

Wallerius makes the specific gravity of the garnet from 3600 to 3900, and even 4400; Briffen makes it 4100; and Cotes says that the garnets of Bohemia are 4360, those of Sweden being 3978. The most esteemed is the Syrian garnet; which is of a fine red, inclining to purple, very transparent, but less beautiful than the oriental amethyst. This, according to Magellan, is the amethystizans of Pliny; and is found in Syria, Calcutta, Cananor, Camboya, and Ethiopia. The soranus of the ancients was another kind of garnet of a red colour inclining to yellow, called *vermeille* by the French, and *giacinto guarnacino* by the Italians; the former having the name of *rubino di rocca* among the last mentioned people. The name *Soranus* comes from Sorian or *Surian*, a town of Pegu, from whence these gems are brought.

Sometimes the garnets have a yellow colour, in which case they obtain the name of *hyacinths*. Like other gems, they are divided into oriental and occidental; but this means in fact no more than *more or less* valuable; the finest stones being always called *oriental*, wherever they come from. Some very fine ones are found in Bohemia; they are also met with in Hungary, at Pyna in Silesia, S. Sapho in the canton of Berne in Switzerland, in Spain, and in Norway. Their colour is supposed to proceed from iron; and, according to M. Saussure, even the finest oriental garnets attract the magnetic needle at a small distance. In the focus of a good burning-glass the garnet melts into a brown mass, which is attracted by the magnet; which shows that iron enters into its composition in a considerable proportion. Some garnets, however, contain a little gold; and some, called by the Germans *zingraupen*, contain tin. M. Magellan is of opinion, that the

Granate, the *lapis alabandicus* of Pliny, and another gem which he mentions of a deep purple, were both true garnets.

3. The cockle or shirl. See COCKLE.

The garnets abound so much with iron that they are sometimes worked with profit as ores of that metal; in which case no notice is taken of the natural character of the stone, in the same manner as is done with clays and jaspers that contain iron; for in these the quantity of metal is gradually augmented, until at last they acquire the appearance of iron itself. The greatest part of this genus, however, contain only from six to twelve *per cent.* of iron, which is too poor to be worked any where with advantage as an ore of that metal. When any of the garnet kind are to be tried for the metal they contain, the iron ought to be melted out of them by the common process; and if the garnet at the same time contains tin or lead, these will likewise be included in the iron. They may be extracted out of it, however, by a heat gradually augmented; the lead and tin sweating out in form of drops, though always somewhat mixed with iron. None of the garnet kind have yet been found in the form of an earth properly so called; though at Swappawari in Lapland, there is found a bole which has the same figure with the garnet; and the horneblende of the Swedes, which is somewhat harder than this bole, has often the appearance of a cockle.

GRANATE-Paste. See GARNET.

GRAND, a term rather French than English, tho' used on many occasions in our language. It has the same import with *great*, being formed of the Latin *grandis*. In this sense we say, the grand-master of an order, the grand-master of Malta, of the free-masons, &c. So also the grand-signor, the grand-visir, &c. grand-father, grand-mother, &c.

In the French polity and customs there are several officers thus denominated, which we frequently retain in English; as grand almoner, grand écuyer, grand chambellan, grand voyer, &c.

GRAND-Assize. See ASSIZE.

GRAND Distress (*distressio magna*), in English law, a writ of distress, so called on account of its extent, which reaches to all the goods and chattels of the party within the county. This writ lies in two cases: either when the tenant or defendant is attached and appears not, but makes default; or where the tenant or defendant hath once appeared, and after makes default. On such occasions, this writ lies by common law, in lieu of a petit cape.

GRAND Gusto, among painters, a term used to express that there is something in the picture very great and extraordinary, calculated to surprise, please, and instruct.—Where this is found, they say, the painter was a man of *grand gusto*; and they use the words *sublime* and *marvellous*, when they speak of a picture, in much the same sense.

GRAND Jury, larceny, serjeanty, &c. See JURY, &c.

GRANDEE, is understood of a lord of the first rank or prime quality.

In Spain, the term *grandees* is used absolutely to denote the prime lords of the court, to whom the king has once given leave to be covered in his presence: there are some grandees for life only; made by the king's saying simply, Be covered. Others are grandees

by descent; made by the king's saying, Be covered for thyself and heirs. These last are reputed far above the former.

There are some who have three or four grandeeships in their family.

GRANDEUR and SUBLIMITY. These terms have a double signification: they commonly signify the quality or circumstance in objects by which the emotions of grandeur and sublimity are produced; sometimes the emotions themselves.

In handling the present subject, it is necessary that the impression made on the mind by the magnitude of an object, abstracting from its other qualities, should be ascertained. And because abstraction is a mental operation of some difficulty, the safest method for judging is, to choose a plain object that is neither beautiful nor deformed, if such a one can be found. The plainest that occurs, is a huge mass of rubbish, the ruins perhaps of some extensive building; or a large heap of stones, such as are collected together for keeping in memory a battle or other remarkable event. Such an object, which in miniature would be perfectly indifferent, makes an impression by its magnitude, and appears agreeable. And supposing it so large as to fill the eye, and to prevent the attention from wandering upon other objects, the impression it makes will be so much the deeper. See ATTENTION.

But though a plain object of that kind be agreeable, it is not termed *grand*: it is not intitled to that character, unless, together with its size, it be possessed of other qualities that contribute to beauty, such as regularity, proportion, order, or colour: and according to the number of such qualities combined with magnitude, it is more or less grand. Thus St Peter's church at Rome, the great pyramid of Egypt, the Alps towering above the clouds, a great arm of the sea, and above all a clear and serene sky, are grand; because, beside their size, they are beautiful in an eminent degree. On the other hand, an overgrown whale, having a disagreeable appearance, is not grand. A large building agreeable by its regularity and proportions, is grand; and yet a much larger building destitute of regularity, has not the least tincture of grandeur. A single regiment in battle-array, makes a grand appearance; which the surrounding crowd does not, though perhaps ten for one in number. And a regiment where the men are all in one livery, and the horses of one colour, makes a grander appearance, and consequently strikes more terror, than where there is confusion of colour and dress. Thus greatness or magnitude is the circumstance that distinguishes grandeur from beauty: agreeableness is the genus, of which beauty and grandeur are species.

The emotion of grandeur, duly examined, will be found an additional proof of the foregoing doctrine. That this emotion is pleasant in a high degree, requires no other evidence but once to have seen a grand object: and if an emotion of grandeur be pleasant, its cause or object, as observed above, must infallibly be agreeable in proportion.

The qualities of grandeur and beauty are not more distinct, than the emotions are which these qualities produce in a spectator. It is observed in the article BEAUTY, that all the various emotions of beauty have one common character, that of sweetness and gaiety. The emotion of grandeur has a different character:

Grandeur
and
Sublimity.

Double signification.

Grandeur distinguishes from beauty.

Grandeur
and
Sublimity.

acter: a large object that is agreeable, occupies the whole attention, and swells the heart into a vivid emotion, which, though extremely pleasant, is rather serious than gay. And this affords a good reason for distinguishing in language these different emotions. The emotions raised by colour, by regularity, by proportion, and by order, have such a resemblance to each other, as readily to come under one general term, viz. *the emotion of beauty*; but the emotion of grandeur is so different from these mentioned, as to merit a peculiar name.

3
Demands
not strict
regularity.

Though regularity, proportion, order, and colour, contribute to grandeur as well as to beauty, yet these qualities are not by far so essential to the former as to the latter. To make out that proposition, some preliminaries are requisite. In the first place, the mind, not being totally occupied with a small object, can give its attention at the same time to every minute part; but in a great or extensive object, the mind, being totally occupied with the capital and striking parts, has no attention left for those that are little or indifferent. In the next place, two similar objects appear not similar when viewed at different distances: the similar parts of a very large object, cannot be seen but at different distances; and for that reason, its regularity, and the proportion of its parts, are in some measure lost to the eye; neither are the irregularities of a very large object so conspicuous as of one that is small. Hence it is, that a large object is not so agreeable by its regularity, as a small object; nor so disagreeable by its irregularities.

These considerations make it evident, that grandeur is satisfied with a less degree of regularity, and of the other qualities mentioned, than is requisite for beauty; which may be illustrated by the following experiment. Approaching to a small conical hill, we take an accurate survey of every part, and are sensible of the slightest deviation from regularity and proportion. Supposing the hill to be considerably enlarged, so as to make us less sensible of its regularity, it will upon that account appear less beautiful. It will not, however, appear less agreeable, because some slight emotion of grandeur comes in place of what is lost in beauty. And at last, when the hill is enlarged to a great mountain, the small degree of beauty that is left, is sunk in its grandeur. Hence it is, that a towering hill is delightful, if it have but the slightest resemblance of a cone; and a chain of mountains not less so, though deficient in the accuracy of order and proportion. We require a small surface to be smooth; but in an extensive plain, considerable inequalities are overlooked. In a word, regularity, proportion, order, and colour, contribute to grandeur as well as to beauty; but with a remarkable difference, that in passing from small to great, they are not required in the same degree of perfection. This remark serves to explain the extreme delight we have in viewing the face of nature, when sufficiently enriched and diversified with objects. The bulk of the objects in a natural landscape are beautiful, and some of them grand: a flowing river, a spreading oak, a round hill, an extended plain, are delightful; and even a rugged rock, or barren heath, though in themselves disagreeable, contribute by contrast to the beauty of the whole; joining to these the verdure of the fields, the mixture of light and shade,

4
Qualities
contributing
to
grandeur.

and the sublime canopy spread over all; it will not appear wonderful, that so extensive a group of splendid objects should swell the heart to its utmost bounds, and raise the strongest emotion of grandeur. The spectator is conscious of an enthusiasm which cannot bear confinement, nor the strictness of regularity and order: he loves to range at large; and is so enchanted with magnificent objects, as to overlook slight beauties or deformities.

Grandeur
and
Sublimity.

The same observation is applicable in some measure to works of art. In a small building, the slightest irregularity is disagreeable: but in a magnificent palace, or a large Gothic church, irregularities are less regarded. In an epic poem, we pardon many negligences that would not be permitted in a sonnet or epigram. Notwithstanding such exceptions, it may be justly laid down for a rule, That in works of art, order and regularity ought to be governing principles; and hence the observation of Longinus, "In works of art we have regard to exact proportion; in those of nature, to grandeur and magnificence."

The same reflections are in a good measure applicable to sublimity: particularly that, like grandeur, it is a species of agreeableness; that a beautiful object placed high, appearing more agreeable than formerly, produces in the spectator a new emotion, termed *the emotion of sublimity*; and that the perfection of order, regularity, and proportion, is less required in objects placed high, or at a distance, than at hand.

The pleasant emotion raised by large objects, has not escaped the poets:

He doth bestride the narrow world
Like a Colossus; and we petty men
Walk under his huge legs. *Julius Caesar. act 1. sc. 3.*

Cleopatra. I dreamt there was an emp'rour Antony:
Oh such another sleep, that I might see
But such another man!
His face was as the heav'ns: and therein stuck
A sun and moon, which kept their course, and lighted
The little O o' th' earth.
His legs bestrid the ocean, his rear'd arm
Crested the world. *Antony and Cleopatra, act 5. sc. 3.*

—Majesty
Dies not alone; but, like a gulph, doth draw
What's near it with it. It's a massy wheel
Fix'd on the summit of the highest mount;
To whose huge spokes ten thousand lesser things
Are mortis'd and adjoin'd; which when it falls,
Each small annexment, petty consequence,
Attends the boist'rous ruin. *Hamlet, act 3. sc. 8.*

The poets have also made good use of the emotion produced by the elevated situation of an object:

Quod si me lyricis vatibus inferes,
Sublimi feriam sidera vertice. *Horat. Carm. l. 2. ode 1.*

Oh thou! the earthly author of my blood,
Whose youthful spirit, in me regenerate,
Doth with a twofold vigour lift me up,
To reach at victory above my head. *Richard II. act 1. sc. 4.*

Northumberland, thou ladder wherewithal
The mounting Bolinbroke ascends my throne. *Richard II. act 5. sc. 2.*

Antony. Why was I rais'd the meteor of the world,
Hung in the skies; and blazing as I travell'd,
Till all my fires were spent; and then cast downward
To be trod out by Cæsar? *Dryden, All for Love, act 1.*

The description of Paradise in the fourth book of *Paradise*

Grandeur
and
Sublimity.

Paradise Lost, is a fine illustration of the impression made by elevated objects :

So on he fares, and to the border comes
Of Eden, where delicious Paradise,
Now nearer, crowns with her inclosure green,
As with a rural mound, the champaign head
With a steep wilderness; whose hairy sides
Of thicket overgrown, grotesque and wild,
Access deny'd; and over head up grew
Insuperable height of loftiest shade,
Cedar, and pine, and fir, and branching palm,
A sylvan scene; and as the ranks ascend,
Shade above shade, a woody theatre
Of stateliest view. Yet higher than their tops
The verd'rous wall of Paradise up sprung;
Which to our general fire gave prospect large
Into his nether empire, neighb'ring round.
And higher than that wall a circling row
Of goodliest trees, loaden with fairest fruit,
Blossoms and fruits at once of golden hue,
Appear'd, with gay enamell'd colours mix'd.

l. 131.

Though a grand object is agreeable, we must not infer that a little object is disagreeable; which would be unhappy for man, considering that he is surrounded with so many objects of that kind. The same holds with respect to place: a body placed high is agreeable; but the same body placed low, is not by that circumstance rendered disagreeable. Littleness and lowness of place are precisely similar in the following particular, that they neither give pleasure nor pain. And in this may visibly be discovered peculiar attention in fitting the internal constitution of man to his external circumstances. Were littleness and lowness of place agreeable, greatness and elevation could not be so: were littleness and lowness of place disagreeable, they would occasion uninterrupted uneasiness.

The difference between great and little with respect to agreeableness, is remarkably felt in a series when we pass gradually from the one extreme to the other. A mental progress from the capital to the kingdom, from that to Europe—to the whole earth—to the planetary system—to the universe, is extremely pleasant: the heart swells, and the mind is dilated at every step. The returning in an opposite direction is not positively painful, though our pleasure lessens at every step, till it vanish into indifference: such a progress may sometimes produce pleasure of a different sort, which arises from taking a narrower and narrower inspection. The same observation holds in a progress upward and downward. Ascent is pleasant because it elevates us; but descent is never painful: it is for the most part pleasant from a different cause, that it is according to the order of nature. The fall of a stone from any height, is extremely agreeable by its accelerated motion. We feel it pleasant to descend from a mountain, because the descent is natural and easy. Neither is looking downward painful; on the contrary, to look down upon objects, makes part of the pleasure of elevation: looking down becomes then only painful when the object is so far below as to create dizziness; and even when that is the case, we feel a sort of pleasure mixed with the pain: witness Shakespeare's description of Dover cliffs:

—How fearful
And dizzy 'tis, to cast one's eye so low!
The crows and choughs, that wing the midway air,
Show scarce so gross as beetles. Half-way down
Hangs one that gathers samphire; dreadful trade!
Methinks he seems no bigger than his head.

The fishermen that walk upon the beach
Appear like mice; and yon tall anchoring bark
Diminish'd to her cock; her cock, a buoy
Almost too small for sight. The murmur'ing surge,
That on th' unnumber'd idle pebbles chafes,
Cannot be heard so high. I'll look no more,
Lest my brain turn, and the deficient sight
Topple down headlong.

King Lear, act 4. sc. 6.

Grandeur
and
Sublimity.

A remark is made above, that the emotions of grandeur and sublimity are nearly allied. And hence it is, that the one term is frequently put for the other: an increasing series of numbers, for example, producing an emotion similar to that of mounting upward, is commonly termed an *ascending series*: a series of numbers gradually decreasing, producing an emotion similar to that of going downward, is commonly termed a *descending series*: we talk familiarly of going *up* to the capital, and of going *down* to the country: from a lesser kingdom we talk of going *up* to a greater; whence the *anabasis* in the Greek language, when one travels from Greece to Persia. We discover the same way of speaking in the language even of Japan; and its universality proves it the offspring of a natural feeling.

6

The foregoing observation leads us to consider grandeur and sublimity in a figurative sense, and as applicable to the fine arts. Hitherto these terms have been taken in their proper sense as applicable to

Grandeur
and subli-
mity in a
figurative
sense.

objects of sight only: and it was of importance to bestow some pains upon that article; because, generally speaking, the figurative sense of a word is derived from its proper sense, which holds remarkably at present. Beauty, in its original signification, is confined to objects of sight; but as many other objects, intellectual as well as moral, raise emotions resembling that of beauty, the resemblance of the effects prompts us to extend the term *beauty* to these objects. This equally accounts for the terms *grandeur* and *sublimity* taken in a figurative sense. Every emotion, from whatever cause proceeding, that resembles an emotion of grandeur or elevation, is called by the same name: thus generosity is said to be an *elevated* emotion, as well as great courage; and that firmness of soul which is superior to misfortunes obtains the peculiar name of *magnanimity*. On the other hand, every emotion that contracts the mind, and fixeth it upon things trivial or of no importance, is termed *low*, by its resemblance to an emotion produced by a little or low object of sight: thus an appetite for trifling amusements is called a *low taste*. The same terms are applied to characters and actions: we talk familiarly of an *elevated* genius, of a *great* man, and equally so of *littleness* of mind: some actions are *great* and *elevated*, and others are *little* and *groveling*. Sentiments, and even expressions, are characterized in the same manner: an expression or line in sentiment that raises the mind is denominated *great* or *elevated*; and hence the *SUBLIME* in poetry. In such figurative terms, we lose the distinction between *great* and *elevated* in their proper sense; for the resemblance is not so entire as to preserve these terms distinct in their figurative application. We carry this figure still farther. Elevation, in its proper sense, imports superiority of place; and lowness, inferiority of place: and hence a man of *superior* talents, of *superior* rank; of *inferior* parts, of *inferior* taste, and such like. The veneration we have for our ancestors, and for the ancients in general, being similar to the emotion produced by an

7

The sub-
lime in
poetry.

Grandeur
and
Sublimity.

elevated object of sight, justifies the figurative expression of the ancients being *raised* above us, or possessing a *superior* place. The notes of the gamut, proceeding regularly from the blunter or grosser sounds to the more acute and piercing, produce in the hearer a feeling somewhat similar to what is produced by mounting upward; and this gives occasion to the figurative expressions a *high note*, a *low note*.

8
Real and
figurative
grandeur
intimately
connected.

Such is the resemblance in feeling between real and figurative grandeur, that among the nations on the east coast of Afric, who are directed purely by nature, the officers of state are, with respect to rank, distinguished by the length of the baton each carries in his hand; and in Japan, princes and great lords show their rank by the length and size of their sedan-poles. Again, it is a rule in painting, that figures of a small size are proper for grotesque pieces; but that an historical subject, grand and important, requires figures as great as the life. The resemblance of these feelings is in reality so strong, that elevation in a figurative sense is observed to have the same effect, even externally, with real elevation:

K. Henry. This day is call'd the feast of Crispian.
He that outlives this day, and comes safe home,
Will stand a-tiptoe when this day is nam'd,
And rouse him at the name of Crispian

Henry V. act 4. sc. 8.

* *Spectator*,
N^o 42.

The resemblance in feeling between real and figurative grandeur is humorously illustrated by Addison in criticising upon English tragedy *. "The ordinary method of making an hero is to clap a huge plume of feathers upon his head, which rises so high, that there is often a greater length from his chin to the top of his head than to the sole of his foot. One would believe, that we thought a great man and a tall man the same thing. As these superfluous ornaments upon the head make a great man, a princess generally receives her grandeur from those additional incumbrances that fall into her tail: I mean the broad sweeping train that follows her in all her motions, and finds constant employment for a boy who stands behind her to open and spread it to advantage." The Scythians, impressed with the fame of Alexander, were astonished when they found him a little man.

A gradual progress from small to great is not less remarkable in figurative than in real grandeur or elevation. Every one must have observed the delightful effect of a number of thoughts or sentiments, artfully disposed like an ascending series, and making impressions deeper and deeper: such disposition of members in a period is termed a *climax*.

Within certain limits grandeur and sublimity produce their strongest effects, which lessen by excess as well as by defect. This is remarkable in grandeur and sublimity taken in their proper sense: the grandest emotion that can be raised by a visible object is where the object can be taken in at one view; if so immense as not to be comprehended but in parts, it

tends rather to distract than satisfy the mind (A): in like manner, the strongest emotion produced by elevation is where the object is seen distinctly; a greater elevation lessens in appearance the object, till it vanish out of sight with its pleasant emotions. The same is equally remarkable in figurative grandeur and elevation; which shall be handled together, because, as observed above, they are scarce distinguishable. Sentiments may be so strained as to become obscure, or to exceed the capacity of the human mind: against such licence of imagination, every good writer will be upon his guard. And therefore it is of greater importance to observe, that even the true sublime may be carried beyond that pitch which produces the highest entertainment. We are undoubtedly susceptible of a greater elevation than can be inspired by human actions the most heroic and magnanimous; witness what we feel from Milton's description of superior beings: yet every man must be sensible of a more constant and sweet elevation when the history of his own species is the subject: he enjoys an elevation equal to that of the greatest hero, of an Alexander or a Cæsar, of a Brutus or an Epaminondas: he accompanies these heroes in their sublimest sentiments and most hazardous exploits, with a magnanimity equal to theirs; and finds it no stretch to preserve the same tone of mind for hours together without sinking. The case is not the same in describing the actions or qualities of superior beings: the reader's imagination cannot keep pace with that of the poet; the mind, unable to support itself in a strained elevation, falls as from a height; and the fall is immoderate like the elevation: where that effect is not felt, it must be prevented by some obscurity in the conception, which frequently attends the descriptions of unknown objects. Hence the St Francis, St Dominics, and other tutelary saints among the Roman Catholics. A mind unable to raise itself to the Supreme Being self-existent and eternal, or to support itself in a strained elevation, finds itself more at ease in using the intercession of some saint whose piety and penances while on earth are supposed to have made him a favourite in heaven.

A strained elevation is attended with another inconvenience, that the author is apt to fall suddenly as well as the reader; because it is not a little difficult to descend, sweetly and easily, from such elevation to the ordinary tone of the subject. The following passage is a good illustration of that observation:

Sæpe etiam immensum cælo venit agmen aquarum,
Et fœdam glomerant tempestatem imbris atris
Conlectæ ex alto nubes. Ruit arduus æther,
Et pluvia ingenti lata læta boumque labores
Diluit. Implentur fossæ, et cava flumina crescunt
Cum sonitu, fervetque fretis spirantibus æquor.
Ipse Pater, media nimborum in nocte, corusca
Fulmina molitur dextra. Quo maxima motu
Terra tremit: fugere feræ, et mortalia corda
Per gentes humilis stravit pavor. Ille flagranti
Aut Atho, aut Rhodopen, aut alta Ceraunia telo
Dejicit: ingeminant Austri, et densissimus imber.

Virg. Georg. l. 1.

In

(A) It is justly observed by Addison, that perhaps a man would have been more astonished with the majestic air that appeared in one of Lysippus's statues of Alexander, though no bigger than the life, than he might have been with Mount Athos, had it been cut into the figure of the hero, according to the proposal of Phidias, with a river in one hand and a city in the other. *Spectator*, N^o 415.

Grandeur
and
Sublimity.

9

Figurative
grandeur.

Grandeur
and
Sublimity.

In the description of a storm, to figure Jupiter throwing down huge mountains with his thunderbolts, is hyperbolically sublime, if we may use the expression: the tone of mind produced by that image is so distant from the tone produced by a thick shower of rain, that the sudden transition must be unpleasant.

Objects of sight that are not remarkably great nor high, scarce raise any emotion of grandeur or of sublimity: and the same holds in other objects; for we often find the mind roused and animated, without being carried to that height. This difference may be discerned in many sorts of music, as well as in some musical instruments: a kettle-drum rouses, and a hautboy is animating; but neither of them inspires an emotion of sublimity: revenge animates the mind in a considerable degree; but it never produceth an emotion that can be termed *grand* or *sublime*; and perhaps no disagreeable passion ever has that effect.

No desire is more universal than to be exalted and honoured; and upon that account, chiefly, are we ambitious of power, riches, titles, fame, which would suddenly lose their relish did they not raise us above others, and command submission and deference: and it may be thought, that our attachment to things grand and lofty, proceeds from their connection with our favourite passion. This connection has undoubtedly an effect; but that the preference given to things grand and lofty must have a deeper root in human nature, will appear from considering, that many bestow their time upon low and trifling amusements, without having the least tincture of this favourite passion: yet these very persons talk the same language with the rest of mankind; and prefer the more elevated pleasures: they acknowledge a more refined taste, and are ashamed of their own as low and grovelling. This sentiment, constant and universal, must be the work of nature; and it plainly indicates an original attachment in human nature to every object that elevates the mind: some men may have a greater relish for an object not of the highest rank; but they are conscious of the preference given by mankind in general to things grand and sublime, and they are sensible that their peculiar taste ought to yield to the general taste.

What is said above suggests a capital rule for reaching the sublime in such works of art as are susceptible of it; and that is, to present those parts or circumstances only which make the greatest figure, keeping out of view every thing low or trivial; for the mind, elevated by an important object, cannot, without reluctance, be forced down to bestow any share of its attention upon trifles. Such judicious selection of capital circumstances, is by an eminent critic styled *grandeur of manner* *. In none of the fine arts is there so great scope for that rule as in poetry; which, by that means, enjoys a remarkable power of bestowing upon objects and events an air of grandeur: when we are spectators, every minute object presents itself in its order; but in describing at second hand, these are laid aside, and the capital objects are brought close together. A judicious taste in thus selecting the most interesting incidents, to give them an united force, accounts for a fact that may appear surprising; which is, that we are more moved by spirited

narrative at second hand, than by being spectators of the event itself, in all its circumstances.

Longinus† exemplifies the foregoing rule by a comparison of two passages.

Grandeur
and
Sublimity.
† Chap. 8.

Ye pow'rs, what madness! how on ships so frail
(Tremendous thought!) can thoughtless mortals sail?
For stormy seas they quit the pleasing plain,
Plant woods in waves, and dwell amidst the main.
Far o'er the deep (a trackless path) they go,
And wander oceans in pursuit of wo.
No ease their hearts, no rest their eyes can find,
On heaven their looks, and on the waves their mind;
Sunk are their spirits, while their arms they rear,
And gods are wearied with their fruitless prayer.

ARISTEUS.

Burst as a wave that from the cloud impends,
And swell'd with tempests on the ship descends.
White are the decks with foam: the winds aloud
Howl o'er the masts, and sing through every shroud.
Pale, trembling, tir'd, the sailors freeze with fears,
And instant death on every wave appears.

HOMER.

In the latter passage, the most striking circumstances are selected to fill the mind with terror and astonishment. The former is a collection of minute and low circumstances, which scatter the thought, and make no impression: it is at the same time full of verbal antitheses and low conceit, extremely improper in a scene of distress.

The following description of a battle is remarkably sublime, by collecting together, in the fewest words, those circumstances which make the greatest figure.

"Like autumn's dark storms pouring from two echoing hills, toward each other approached the heroes; as two dark streams from high rocks meet and roar on the plain, loud, rough, and dark in battle, meet Lochlin and Inisfail. Chief mixes his strokes with chief, and man with man: steel sounds on steel, and helmets are cleft on high: blood bursts and smokes around: strings murmur on the polish'd yew: darts rush along the sky: spears fall like sparks of flame that gild the stormy face of night.

"As the noise of the troubled ocean when roll the waves on high, as the last peal of thundering heaven, such is the noise of battle. Though Cormac's hundred bards were there, feeble were the voice of a hundred bards to send the deaths to future times; for many were the deaths of the heroes, and wide poured the blood of the valiant." FINGAL.

The following passage in the 4th book of the Iliad is a description of a battle wonderfully ardent. "When now gathered on either side, the hosts plunged together in fight; shield is harshly laid to shield; spears crash on the brazen corselets; bossy buckler with buckler meets; loud tumult rages over all; groans are mixed with boasts of men; the slain and slayer join in noise; the earth is floating round with blood. As when two rushing streams from two mountains come roaring down, and throw together their rapid waters below, they roar along the gulphy vale; the startled shepherd hears the sound as he stalks o'er the distant hills: so, as they mixed in fight, from both armies clamour with loud terror arose." But such general descriptions are not frequent in Homer. Even his single combats are rare. The fifth book is the longest account of a battle that is in the Iliad; and yet contains nothing but a long catalogue of chiefs killing chiefs,

Grandeur
and
Sublimity.

chiefs, not in single combat neither, but at a distance with an arrow or a javelin; and these chiefs named for the first time and the last. The same scene is continued through a great part of the sixth book. There is at the same time a minute description of every wound, which for accuracy may do honour to an anatomist, but in an epic poem is tiresome and fatiguing. There is no relief from horrid languor but the beautiful Greek language and melody of Homer's versification.

In the twenty-first book of the *Odyssey*, there is a passage which deviates widely from the rule above laid down: it concerns that part of the history of Penelope and her suitors, in which she is made to declare in favour of him who should prove the most dexterous in shooting with the bow of Ulysses:

Now gently winding up the fair ascent,
By many an easy step the matron went:
Then o'er the pavement glides with grace divine
(With polish'd oak the level pavements shine).
The folding gates a dazzling light display'd,
With pomp of various architrave o'erlaid.
The bolt, obedient to the silken string,
Forfeakes the staple as she pulls the ring;
The wards respondent to the key turn'd round;
The bars fall back; the flying valves resound.
Loud as a bull makes hill and valley ring,
So roar'd the lock when it releas'd the spring.
She moves majestic through the wealthy room,
Where treasur'd garments cast a rich perfume:
There, from the column where aloft it hung,
Reach'd, in its splendid case, the bow unstring.

Virgil sometimes errs against this rule: in the following passages minute circumstances are brought into full view; and what is still worse, they are described with all the pomp of poetical diction, *Æneid*, L. i. l. 214, to 219. L. vi. l. 176, to 182. L. vi. l. 212, to 231: and the last, which describes a funeral, is the less excusable, as the man whose funeral it is makes no figure in the poem.

The speech of Clytemnestra, descending from her chariot, in the *Iphigenia* of Euripides*, is stuffed with a number of common and trivial circumstances.

But of all writers, Lucan in this article is the most injudicious: the sea-fight between the Romans and Massilians†, is described so much in detail, without exhibiting any grand or total view, that the reader is fatigued with endless circumstances, without ever feeling any degree of elevation; and yet there are some fine incidents, those, for example, of the two brothers, and of the old man and his son, which, taken separately, would affect us greatly. But Lucan, once engaged in a description, knows no end. See other passages of the same kind, L. iv. l. 292, to 337. L. iv. l. 750, to 765. The episode of the sorceress Erietho, end of book sixth, is intolerably minute and prolix.

This rule is also applicable to other fine arts. In painting it is established, that the principal figure must be put in the strongest light; that the beauty of attitude consists in placing the nobler parts most in view, and in suppressing the smaller parts as much as possible; that the folds of the drapery must be few and large; that foreshortenings are bad, because they make the parts appear little; and that the muscles ought to be kept as entire as possible, without being divided into small sections. Every one at present subscribes to that rule as applied to gardening, in opposition to

parterres split into a thousand small parts in the stiffest regularity of figure. The most eminent architects have governed themselves by the same rule in all their works.

Another rule chiefly regards the sublime, though it is applicable to every sort of literary performance intended for amusement; and that is, to avoid as much as possible abstract and general terms. Such terms, similar to mathematical signs, are contrived to express our thoughts in a concise manner; but images, which are the life of poetry, cannot be raised in any perfection but by introducing particular objects. General terms, that comprehend a number of individuals, must be excepted from that rule: our kindred, our clan, our country, and words of the like import, though they scarce raise any image, have, however, a wonderful power over the passions: the greatness of the complex object overbalances the obscurity of the image.

Grandeur, being an extreme vivid emotion, is not readily produced in perfection but by reiterated impressions. The effect of a single impression can be but momentary; and if one feel suddenly somewhat like a swelling or exaltation of mind, the emotion vanisheth as soon as felt. Single thoughts or sentiments are often cited as examples of the sublime; but their effect is far inferior to that of a grand subject displayed in its capital parts. We shall give a few examples, that the reader may judge for himself. In the famous action of Thermopylæ, where Leonidas the Spartan king, with his chosen band, fighting for their country, were cut off to the last man, a saying is reported of Dieneces, one of the band, which, expressing cheerful and undisturbed bravery, is well intitled to the first place in examples of that kind: talking of the number of their enemies, it was observed, that the arrows shot by such a multitude would intercept the light of the sun; "So much the better (says he), for we shall then fight in the shade."

Herodot.
lib. 7.

Somerſet. Ah! Warwick, Warwick, wert thou as we are,
We might recover all our loss again.

The Queen from France hath brought a puissant power.
Ev'n now we heard the news. Ah! could'st thou fly!

Warwick. Why, then I would not fly.

Third part, Henry VI. act 5. sc. 3.

Such a sentiment from a man expiring of his wounds, is truly heroic; and must elevate the mind to the greatest height that can be done by a single expression: it will not suffer in a comparison with the famous sentiment *Qu'il mourut* of Corneille: the latter is a sentiment of indignation merely, the former of firm and cheerful courage.

To cite in opposition many a sublime passage, enriched with the finest images, and dressed in the most nervous expressions, would scarce be fair. We shall produce but one instance, from Shakespeare, which sets a few objects before the eye, without much pomp of language: it operates its effect by representing these objects in a climax, raising the mind higher and higher till it feel the emotion of grandeur in perfection:

The cloud-capt tow'rs, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve, &c.

The cloud-capt tow'rs produce an elevating emotion, heightened by the gorgeous palaces; and the mind is carried still higher and higher by the images that follow.

* *Æt* 3.

Grandeur
and
Sublimity.

12
Grandeur
and subli-
mity em-
ployed in-
directly
to sink the
mind.

Grandeur
and
Sublimity.

low. Successive images, making thus stronger and stronger impressions, must elevate more than any single image can do.

As, on the one hand, no means directly applied have more influence to raise the mind than grandeur and sublimity; so, on the other, no means indirectly applied have more influence to sink and depress it: for in a state of elevation, the artful introduction of an humbling object, makes the fall great in proportion to the elevation. Of this observation Shakespeare gives a beautiful example in the passage last quoted:

The cloud-capt tow'rs, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve,
And like the baseless fabric of a vision
Leave not a wreck behind ——— *Tempest*, act 4. sc. 4

The elevation of the mind in the former part of this beautiful passage, makes the fall great in proportion, when the most humbling of all images is introduced, that of an utter dissolution of the earth and its inhabitants. The mind, when warmed, is more susceptible of impressions than in a cool state; and a depressing or melancholy object listened to, makes the strongest impression when it reaches the mind in its highest state of elevation or cheerfulness.

But a humbling image is not always necessary to produce that effect: a remark is made above, that in describing superior beings, the reader's imagination, unable to support itself in a strained elevation, falls often as from a height, and sinks even below its ordinary tone. The following instance comes luckily in view; for a better cannot be given: "God said, Let there be light, and there was light." Longinus quotes this passage from Moses as a shining example of the sublime; and it is scarce possible, in fewer words, to convey so clear an image of the infinite power of the Deity: but then it belongs to the present subject to remark, that the emotion of sublimity raised by this image is but momentary; and that the mind, unable to support itself in an elevation so much above nature, immediately sinks down into humility and veneration for a Being so far exalted above groveling mortals. Every one is acquainted with a dispute about that passage between two French critics*, the one positively affirming it to be sublime, the other as positively denying. What has been remarked, shows, that both of them have reached the truth, but neither of them the whole truth: the primary effect of the passage is undoubtedly an emotion of grandeur; which so far justifies Boileau: but then every one must be sensible, that the emotion is merely a flash, which, vanishing instantaneously, gives way to humility and veneration. That indirect effect of sublimity justifies Huet, on the other hand, who being a man of true piety, and probably not much carried by imagination, felt the humbling passions more sensibly than his antagonist did. And laying aside difference of character, Huet's opinion may perhaps be defended as the more solid; because, in such images, the depressing emotions are the more sensibly felt, and have the longer endurance.

The straining an elevated subject beyond due bounds, and beyond the reach of an ordinary conception, is not a vice so frequent as to require the correction of criticism. But false sublime is a rock that writers of

more fire than judgment commonly split on; and therefore a collection of examples may be of use as a beacon to future adventurers. One species of false sublime, known by the name of *bombast*, is common among writers of a mean genius: it is a serious endeavour, by strained description, to raise a low or familiar subject above its rank; which, instead of being sublime, fails not to be ridiculous. The mind, indeed, is extremely prone, in some animating passions, to magnify its objects beyond natural bounds: but such hyperbolical description has its limits; and when carried beyond the impulse of the propensity, it degenerates into burlesque. Take the following examples:

Sejanus. ——— Great and high
The world knows only two, that's Rome and I.
My roof receives me not: 'tis air I tread,
And at each step I feel my advanc'd head
Knock out a star in heav'n. *Sejanus*, *Ben Johnson*, act 5.

A writer who has no natural elevation of mind deviates readily into bombast: he strains above his natural powers; and the violent effort carries him beyond the bounds of propriety.

Guilford. Give way, and let the gushing torrent come;
Behold the tears we bring to swell the deluge,
Till the flood rise upon the guilty world,
And make the ruin common.

Lady Jane Grey, act 4. near the end.

Another species of false sublime is still more faulty than bombast: and that is, to force elevation by introducing imaginary beings without preserving any propriety in their actions; as if it were lawful to ascribe every extravagance and inconsistency to beings of the poet's creation. No writers are more licentious in that article than Johnson and Dryden:

Methinks I see Death and the Furies waiting
What we will do, and all the heaven at leisure
For the great spectacle. Draw then your swords:
And if our destiny envy our virtue
The honour of the day, yet let us care
To sell ourselves at such a price, as may
Undo the world to buy us, and make Fate,
While she tempts ours, to fear her own estate.

Catiline, act 5.

——— The Furies stood on hills
Circling the place, and trembled to see men
Do more than they: whilst Piety left the field,
Griev'd for that side, that in so bad a cause
They knew not what a crime their valour was.
The Sun stood still, and was, behind the cloud
The battle made, seen sweating to drive up
His frightened horse, whom still the noise drove backward.

Ibid. act 5.

Osmyn. While we indulge our common happiness,
He is forgot by whom we all possess,
The brave Almazor, to whose arms we owe
All that we did, and all that we shall do;
Who like a tempest that outrides the wind,
Made a just battle ere the bodies join'd.

Abdalla. His victories we scarce could keep in view,
Or polish 'em so fast as he rough drew.

Abdemelech. Fate after him below with pain did move,
And Victory could scarce keep pace above.
Death did at length so many slain forget,
And lost the tale, and took 'em by the great.

Conquest of Granada, act 2. at beginning.

An actor on the stage may be guilty of bombast as well as an author in his closet: a certain manner of acting, which is grand when supported by dignity in the sentiment and force in the expression, is ridiculous where the sentiment is mean and the expression flat.

Grandgor
||
Granicus.

GRANDGOR is used in Scotland for the pox. In the Philosophical Transactions, n° 469. sect. 5. we have a proclamation of king James IV. of Scotland, ordering all who had this disease, or who had attended others under it, forthwith to repair to an island in the Frith of Forth. If the grandgor was the pox, and this distemper came into Europe at the siege of Naples in 1495, it must have made a very quick progress to cause such an alarm at Edinburgh in 1497.

GRANGE, an ancient term for a barn or place wherein to lay up and thresh corn. The word is formed of the Latin *granea*; or of *granum*, "grain, corn," &c. Hence also *granger* or *grangier*, "a grange-keeper or farmer."

GRANGE is also used, in a more extensive sense, for a whole farm, with all the appendages of stables for horses, stalls for cattle, &c. and for an inn.

GRANI, in our ancient Writers, mustachoes or whiskers of a beard. The word seems formed from the ancient British or Irish *greann*, "a beard." It is given for a reason why the cup is refused to the laity, *Quia barbari, & prolixos habent granos, dum poculum inter epulas sumunt, prius liquore pilos inficiunt, quam ori infundunt.*

GRANICUS, a small river near the Hellespont in Lesser Asia, remarkable for the first victory gained by Alexander the Great over the armies of Darius.—Authors disagree very much about the number of the Persians, though all agree that they were vastly more numerous than the Greeks. Justin and Orosius tell us, that the Persian army consisted of 600,000 foot and 20,000 horse; Arrian makes the foot amount to 200,000; but Diodorus tells us, that they were not more than 100,000 foot and 10,000 horse. The Macedonian army did not exceed 30,000 foot and 5000 horse. The Persian cavalry lined the banks of the Granicus, in order to oppose Alexander wherever he should attempt a passage; and the foot were posted behind the cavalry on an easy ascent. Parmenio would have had Alexander to allow his troops some time to refresh themselves; but he replied, that, after having crossed the Hellespont, it would be a disgrace to him and his troops to be stopped by a rivulet. Accordingly a proper place for crossing the river was no sooner found, than he commanded a strong detachment of horse to enter; he himself followed with the right wing, which he commanded in person; the trumpets in the mean time sounding, and loud shouts of joy being heard through the whole army. The Persians let fly such showers of arrows against the detachment of Macedonian horse, as caused some confusion; several of their horses being killed or wounded. As they drew near the bank a most bloody engagement ensued; the Macedonians attempting to land, and the Persians pushing them back into the river. Alexander, who observed the confusion they were in, took the command of them himself; and landing in spite of all opposition, obliged the Persian cavalry, after an obstinate resistance, to give ground. However, Spithrobates, governor of Ionia, and son-in-law to Darius, still maintained his ground, and did all that lay in his power to bring them back to the charge. Alexander advanced full gallop to engage him; neither did he decline the combat, and both were slightly wounded at

N° 143.

the first encounter. Spithrobates having thrown his javelin without effect, advanced sword in hand to meet his antagonist, who ran him through with his pike as he raised his arm to discharge a blow with his scymitar. But Rosaces, brother to Spithrobates, at the same time gave Alexander such a furious blow on the head with his battle-ax, that he beat off his plume, and slightly wounded him through the helmet. As he was ready to repeat the blow, Clitus with one stroke of his scymitar cut off Rosaces's head, and thus in all probability saved the life of his sovereign. The Macedonians then, animated by the example of their king, attacked the Persians with new vigour, who soon after betook themselves to flight. Alexander did not pursue them; but immediately charged the enemy's foot with all his forces, who had now passed the river. The Persians, disheartened at the defeat of their cavalry, made no great resistance. The Greek mercenaries retired in good order to a neighbouring hill, whence they sent deputies to Alexander desiring leave to march off unmolested. But he, instead of coming to a parley with them, rushed furiously into the middle of this small body; where his horse was killed under him, and he himself in great danger of being cut in pieces. The Greeks defended themselves with incredible valour for a long time, but were at last almost entirely cut off. In this battle the Persians are said to have lost 20,000 foot and 2500 horse, and the Macedonians only 55 foot and 60 horse.

GRANITE, in natural history, a distinct genus of stones, composed of separate and very large concretions rudely compacted together; of great hardness, giving fire with steel, not fermenting with acids, and slowly and imperfectly calcinable in a great fire.

Of this genus there are three species: 1. The hard white granite, with black spots, commonly called moor-stone. This is a very valuable kind, consisting of a beautiful congeries of very variously constructed and differently coloured particles, not diffused among or running into one another, but each pure and distinct, though firmly adhering to whichever of the others it comes in contact with, and forming a very firm mass. It is much used in London for the steps of public buildings, and on other occasions where great strength and hardness are required. 2. The hard red granite variegated with black and white, and common in Egypt and Arabia. 3. The pale whitish granite, variegated with black and yellow. This is sometimes found in strata, but more frequently in loose nodules, and is used for paving the streets.

Some of these kinds of stones are found in almost every country, and in many places they are found of immense bigness. The largest mass of this kind in the known world, lying as an unconnected stone, is found near the Cape of Good Hope in Africa, and of which we have the following description in the Philosoph. Transact. vol. 68. p. 102, given by Mr Anderson in a letter to Sir John Pringle. "The stone is so remarkable, that it is called by the people here the *Tower of Babel*, and by some the *Pearl Diamond*. It either takes the last name from a place near which it is situated, or it gives name to the tract of cultivated land called the Pearl. It lies upon the top of a ridge of low hills, beyond a large plain, at

Granite,

the

Granite. the distance of about thirty miles from the Cape Town; beyond which, at a little distance, is a range of hills of a much greater height. It is of an oblong shape, and lies north and south. The south end is highest; the east and west sides are steep and high; but the top is rounded, and slopes away gradually to the north end, so that you can ascend it by that way, and enjoy a most extensive prospect of the whole country. I could not precisely determine its circumference, but it took us above half an hour to walk round it; and by making every allowance for the rugged way, and stopping a little, I think the most moderate computation must make it exceed half a mile. The same difficulty occurred with respect to knowing its height: but I think, that, at the south end, it is nearly equal to half its length: or, were I to compare it to an object you are acquainted with, I should say it equalled the dome of St Paul's church.

"I am uncertain whether it ought to be considered as the top of the hill, or a detached stone, because there is no positive proof of either, unless we were to dig about its base; but it would certainly impress every beholder, at first sight, with the idea of its being one stone, not only from its figure, but because it is really one solid uniform mass from top to bottom, without any interruption; which is contrary to the general character of the high hills of this country, they being commonly divided, or composed of different strata, at least if we may judge from the rows of plants or shrubs which grow on the sides of the steepest, and, as I suppose, are produced from the small quantity of earth interposed between them. It has indeed a few fissures, or rather impressions, which do not reach deeper than four or five feet; and near its north end a stratum of a more compact stone runs across, which is not above twelve or fourteen inches thick, with its surface divided into little squares, or oblongs, disposed obliquely. This stratum is perpendicular; but whether it cuts the other to its base, or is superficial, I cannot determine. Its surface is also so smooth, that it does not appear to have formerly been joined to, or separated from, any other part by violence, as is the case with many other large fragments; but enjoys the exact situation where it was originally placed, and has undergone little change from being exposed for so many successive ages to the calcining power of a very hot climate."—A part of this stone being examined by Sir William Hamilton, he determined it to be a granite, and of the same nature with the tops of some of the Alps; and supposes both of them to have been elevated by volcanic explosions.

GRANITE, a genus of stones of the order of *petræ*, belonging to the class of *saxa*. The principal constituent parts of this stone are felt-spar or rhombic quartz, mica, and quartz. These ingredients constitute the hardest sort of granite, and that most anciently known. That into which schoerl enters is more subject to decomposition. They never have any particular texture or regular form, but consist of enormous shapeless masses extremely hard. In the finer granites the quartz is transparent; in others generally white or grey, violet or brown. The felt-spar is generally the most copious ingredient, and of a white, yellow, red, black, or brown colour. The mica is also grey, brown, yellow, green, red, violet, or black; and commonly the least

copious. The schoerl is generally black, and abounds in the granites that contain it. Hence the colour of the granites depends principally on that of the spar or schoerl. The red granites consist commonly of white quartz, red felt-spar, and grey mica; the grey ones of white quartz, grey or violet felt-spar, and black mica. The black granites commonly contain schoerl instead of felt-spar; and the green usually contain green quartz.

On exposing granite to the flame of a blow-pipe, the component ingredients separate from one another. Mr Gerhard having melted some in a crucible, found the felt-spar run into a transparent glass; below it the mica lay in form of a black slag, the quartz remaining unaltered. It melted somewhat better when all the three were powdered and mixed together; though even then the quartz was still discernible by a magnifying glass. Hence we may explain the reason why grains of a white colour are sometimes found in volcanic lavas. The mixture of mica prevents the flix or quartz from splitting or cracking; and hence its infusibility and use in furnace-building.

Granites are seldom slaty or laminated. In those which are of a close texture, the quartz and schoerl predominate. They take a good polish; for which reason the Egyptians formerly, and the Italians still work them into large pieces of ornamental architecture, for which they are extremely fit, as not being liable to decay in the air. Farber, in his letters from Italy, mentions a kind of stone named *granitone*, composed of felt-spar and mica: a substance of this kind, which moulders in the air, is found in Finland; which is said to contain salt-petre, and sometimes common salt. In that country it is called *rapakiri*. Wallerius describes 18 species of granites, besides many others akin to this genus. Those described by Cronstedt are, 1. Loose or friable, which comes from France, and is used at the brass-works for casting that metal in. 2. Hard or compact, of which there are two varieties, red and grey. The former is met with of two kinds; viz. fine-grained from Swappari in Lapland, or coarse-grained from the province of Dalarne in Sweden. The grey, with other colours, is met with on the coast round Stockholm and Norland in Sweden.

GRANITELLO, a genus of stones of the order of *petræ*, belonging to the class of *saxa*. There are two species, 1. That composed of distinct particles, found in several of the mountainous parts of Sweden. In some of these there is a predominance of quartzose particles, in others of micaceous; in which last case the stone is slaty, and easily split. 2. Granitello, composed of convoluted particles. This is met with of different colours, as whitish grey, greenish, and reddish.

Both these kinds of stone are used in building furnaces, on account of the powerful resistance they make to the fire; but the latter is preferable to the other, on account of its containing a little of a refractory clayish substance. It is likewise of great use in mills, where the fellow is a coarse sand-stone.

GRANIVOROUS, an appellation given to animals which feed on corn or seeds. These are principally of the bird kind.

GRANT, in law, a conveyance in writing of such things as cannot pass or be conveyed by word only; such are rents, reversions, services, &c.

GRANT (Francis), Lord Cullen, an eminent lawyer

Granitello

||
Grant.

Grant.

yer and judge in Scotland, was descended from a younger branch of the family of the Grants of Grant in that kingdom, and was born about the year 1660. When he commenced advocate, he made a distinguished figure at the revolution, by opposing the opinion of the old lawyers, who warmly argued on the inability of the convention of estates to make any disposition of the crown. The abilities he showed in favour of the revolution recommended him to an extensive practice; in which he acquired so much honour, that when the union between the two kingdoms was in agitation, queen Anne unexpectedly, and without application, created him a baronet, with a view of securing his interest in that measure; and upon the same principle, she soon after created him a judge, or one of the lords of session. From this time, according to the custom of Scotland, he was styled, from the name of his estate, Lord Cullen; and the same good qualities that recommended him to this honourable office, were very conspicuous in the discharge of it; which he continued for 20 years with the highest reputation, when a period was put to his life by an illness which lasted but three days. He expired without any agony on March 16th 1726.—His character is drawn to great advantage in the *Biographia Britannica*; where it is observed, among other remarks to his honour, “That as an advocate he was indefatigable in the management of business; but at the same time that he spared no pains, he would use no craft. He had so high an idea of the dignity of his profession, that he held it equally criminal to neglect any honest means of coming at justice, or to make use of any arts to elude it. In respect to fortune, though he was modest and frugal, and had a large practice, yet he was far from being avaricious. His private charities were very considerable, and grew in the same proportion with his profits. He was, besides, very scrupulous in many points; he would not suffer a just cause to be lost through a client’s want of money. He was such an enemy to oppression, that he never denied his assistance to such as laboured under it; and with respect to the clergy of all professions (in Scotland), his conscience obliged him to serve them without a fee. When his merit had raised him to the bench, he thought himself accountable to God and man for his conduct in that high office; and that deep sense of his duty, at the same time that it kept him strictly to it, encouraged and supported him in the performance. Whenever he sat as lord ordinary; the paper of causes was remarkably full, for his reputation being equally established for knowledge and integrity, there were none, who had a good opinion of their own pretensions, but were desirous of bringing them before him, and not many who did not sit down satisfied with his decision. This prevailed more especially after it was found that few of his sentences were reversed; and when they were, it was commonly owing to himself: for if, upon mature reflection, or upon new reasons offered at the re-hearing, he saw any just ground for altering his judgment, he made no scruple of declaring it; being persuaded, that it was more manly, as well as more just, to follow truth, than to support opinion: and his conduct in this respect had a right effect; for instead of lessening, it raised his reputation. He would not, however, with all this great stock of know-

ledge, experience, and probity, trust himself in matters of blood, or venture to decide in criminal cases on the lives of his fellow-creatures; which was the reason that, though often solicited, he could never be prevailed upon to accept of a seat in the judiciary court.—In his private character he was as amiable as he was respectable in his public. He was charitable without ostentation, disinterested in his friendships, and beneficent to all who had any thing to do with him. He was not only strictly just; but so free from any species of avarice, that his lady, who was a woman of great prudence and discretion, finding him more intent on the business committed to him by others than on his own, took upon herself the care of placing out his money; and to prevent his postponing, as he was apt to do, such kind of affairs, when securities offered, she caused the circumstances of them to be stated in the form of cases, and so procured his opinion upon his own concerns as if they had been those of a client. He was so true a lover of learning, and was so much addicted to his studies, that, notwithstanding the multiplicity of his business while at the bar, and his great attention to his charge when a judge, he nevertheless found time to write various treatises on very different and important subjects: Some political, which were remarkably well-timed, and highly serviceable to the government: others of a most extensive nature, such as his essays on law, religion, and education, which were dedicated to George II. when prince of Wales; by whose command, his then secretary, Mr Samuel Molyneux, wrote him a letter of thanks, in which were many gracious expressions, as well in relation to the piece as to its author. He composed, besides these, many discourses on literary subjects, for the exercise of his own thoughts, and for the better discovery of truth; which went no farther than his own closet, and from a principle of modesty were not communicated even to his most intimate friends.”

GRANTHAM, a town of Lincolnshire, 110 miles from London. It is a neat populous town, with abundance of very good inns of great resort, on the north road, and situated on the river Witham. It is supposed to have been a Roman town by the remains of a castle which have been formerly dug up here. It is governed by an alderman and 12 justices of the peace, a recorder, a coroner, an escheator, 12 second twelve men, who are of the common council, and 12 constables to attend the court. Here is a fine large church with a stone spire, one of the loftiest in England, being 288 feet high, and, by the deception of the light, seems to stand awry, which, by the church being situated so low, appears to a very great disadvantage. Here is a good free-school, where Sir Isaac Newton received his first education, besides two charity-schools. On the neighbouring course are frequent horse races.

GRANVILLE (George), lord Lansdowne, was descended from a very ancient family, derived from Rollo the first duke of Normandy. At eleven years of age he was sent to Trinity College in Cambridge, where he remained five years: but at the age of 13 was admitted to the degree of master of arts; having, before he was 12, spoken a copy of verses of his own composition to the duchess of York at his college, when she paid a visit to the University of Cam-

ter.

Cambridge. In 1696, his comedy called the *She-gal-lants* was acted at the theatre-royal in Lincoln's-inn-fields, as his tragedy called *Heroic Love* was in the year 1698. In 1702 he translated into English the *second Olynthian of Demosthenes*. He was member for the county of Cornwall in the parliament which met in 1710; was afterwards secretary of war, comptroller of the household, then treasurer, and sworn one of the privy-council. The year following, he was created baron Lansdowne. On the accession of king George I. in 1714, he was removed from his treasurer's place; and the next year entered his protest against the bills for attainting lord Bolingbroke and the duke of Ormond. He entered deeply into the scheme for raising an insurrection in the west of England; and being seized as a suspected person, was committed to the Tower, where he continued two years. In 1719, he made a speech in the house of Lords, against the bill to prevent occasional conformity. In 1722, he withdrew to France, and continued abroad almost ten years. At his return in 1732, he published a fine edition of his works in 2 vols quarto. He died in 1735, leaving no male issue.

GRANVILLE, a sea-port town of France, in Lower Normandy, partly seated on a rock and partly on a plain. It gave title to an English earl, now extinct. W. Long. 1. 32. N. Lat. 48. 58.

GRANULATED, something that has undergone granulation. See the next article.

GRANULATION, in chemistry, an operation by which metallic substances are reduced into small grains, or roundish particles; the use of which is, to facilitate their combination with other substances.—This operation is very simple; it consists only in pouring a melted metal slowly into a vessel filled with water, which is in the mean time to be agitated with a broom. With melted copper, however, which is apt to explode with great violence on the contact of water, some precautions are to be observed, of which an account is given under the article CHEMISTRY, n^o 1148. Lead or tin may be granulated by pouring them when melted into a box; the internal surface of which is to be rubbed with powdered chalk, and the box strongly shaken till the lead has become solid. Metals are granulated, because their ductility renders them incapable of being pounded, and because filing is long and tedious, and might render the metal impure by an admixture of iron from the file.

GRAPE, the fruit of the vine. See VINE and WINE. See also CURRANT and RAISIN.

GRAPE-Shot, in artillery, is a combination of small shot, put into a thick canvas bag, and corded strongly together, so as to form a kind of cylinder, whose diameter is equal to that of the ball adapted to the cannon. The number of shot in a grape varies according to the service or size of the guns: in sea-service nine is always the number; but by land it is increased to any number or size, from an ounce and a quarter in weight to three or four pounds. In sea-service the bottoms and pins are made of iron, whereas those used by land are of wood.

GRAPEs, in the manege, a term used to signify the arrests or mangy tumours that happen in the horse's legs.

GRAPHOMETER, a mathematical instrument,

otherwise called a *Semicircle*; the use of which is to observe any angle whose vertex is at the centre of the instrument in any plane (though it is most commonly horizontal, or nearly so), and to find how many degrees it contains. See GEOMETRY, p. 674, prop. xi. &c.

GRAPNEL, or GRAPPLING, a sort of small anchor, fitted with four or five flukes or claws, and commonly used to ride a boat or other small vessel.

Fire-GRAPPLING, an instrument nearly resembling the former, but differing in the construction of its flukes, which are furnished with strong barbs on their points. These machines are usually fixed on the yard-arms of a ship, in order to grapple any adversary whom she intends to board. They are, however, more particularly useful in *Fire Ships* for the purposes described in that article.

GRASS, in botany, is defined to be a plant having simple leaves, a stem generally jointed and tubular, a husky calyx (called *gluma*), and the seed single. Hence wheat, oats, barley, &c. are properly grasses, according to the definition given; while clover and some other similar plants are not grasses, though so frequently called by that name.—Of grass, the leaves are food for cattle, the small seeds for birds, and the larger grain chiefly for man. And it is observable, that nature has so provided, that cattle (in grazing) seldom eat the flower intended to produce seed, unless compelled by hunger.

For the culture of the different sorts of grain, see AGRICULTURE, n^o 122. & *seq.*; and for that of the grasses commonly so called, see the same article, n^o 175. & *seq.* and the references below.

Culmiferous grasses might be divided into two general classes for the purposes of the farmer, that it might be of use for him to attend to: viz. 1st, Those which, like the common annual kinds of corn, run chiefly to seed-stalks; the leaves gradually decaying as these advance towards perfection, and becoming totally withered or falling off entirely when the seeds are ripe. Rye-grass belongs to this class in the strictest sense. To it likewise may be assigned the vernal-grass, dogs-tail-grass, and fine bent-grass. 2^{dly}, Those whose leaves continue to advance even after the seed-stalks are formed, and retain their verdure and succulence during the whole season, as is the case with the fescue and poa tribes of grasses, whose leaves are as green and succulent when the seeds are ripe and the flower-stalks fading, as at any other time.

“It is wonderful, Mr Stillingfleet † remarks, to see how long mankind has neglected to make a proper advantage of plants of such importance, and which, in almost every country, are the chief food of cattle. The farmer, for want of distinguishing and selecting grasses for seed, fills his pastures either with weeds or bad or improper grasses; when, by making a right choice, after some trials, he might be sure of the best grass, and in the greatest abundance that his land admits of. At present, if a farmer wants to lay down his land to grass, what does he do? he either takes his seeds indiscriminately from his own foul hay-rick, or sends to his next neighbour for a supply. By this means, besides a certain mixture of all sorts of rubbish, which must necessarily happen, if he chances to have a large proportion of good seeds, it is not unlikely but that what he intends for dry land may come from moist,

Grapnel,
Grass.

† *Tracts relating to Nat. Hist. &c.*

Grass.

where it grew naturally, and the contrary. This is such a slovenly method of proceeding, as one would think could not possibly prevail universally: yet this is the case as to all grasses except the darnel-grass, and what is known in some few counties by the name of the *Suffolk-grass*; and this latter instance is owing, I believe, more to the soil than any care of the husbandman. Now, would the farmer be at the pains of separating once in his life half a pint or a pint of the different kinds of grass seeds, and take care to sow them separately, in a very little time he would have wherewithal to stock his farm properly, according to the nature of each soil, and might at the same time spread these seeds separately over the nation, by supplying the seed-shops. The number of grasses fit for the farmer is, I believe, small, perhaps half a dozen or half a score are all he need to cultivate; and how small the trouble would be of such a task, and how great the benefit, must be obvious to every one at first sight. Would not any one be looked on as wild who should sow wheat, barley, oats, rye, pease, beans, vetches, buck-wheat, turnips, and weeds of all sorts together? yet how is it much less absurd to do what is equivalent in relation to grasses? Does it not import the farmer to have good hay and grass in plenty? and will cattle thrive equally on all sorts of food? We know the contrary. Horses will scarcely eat hay that will do well enough for oxen and cows. Sheep are particularly fond of one sort of grass, and fatten upon it faster than any other, in Sweden, if we may give credit to Linnæus. And may they not do the same in Britain? How shall we know till we have tried?"

As the generality of farmers know scarce any of the grasses by name, and as without such knowledge little improvement can be made in this branch of husbandry, we have on Plate CCXXIII. given figures of those sorts which have been recommended as the most profitable, viz.

1. *Hordeum murinum*, RYE-GRASS *vulgò*. [Rye-grass *proprie* is the *SECALE villosum*. Perennial darnel, *Lolium perenne*, is also, in some counties of England, improperly called *rye-grass*.] See AGRICULTURE, no 179.

2. *Festuca rubra*, PURPLE FESCUE-GRASS. See AGRICULTURE, no 54.

3. *Festuca ovina*, SHEEPS ditto. See AGRICULTURE, no 56—58. This is perhaps the most valuable grass of all. It is observed to grow and thrive on lands of all qualities and in all situations, from the driest upland pastures to the very moist parts of meadows. It does not part with its seeds till some time after they are ripe, and even quite dry. It makes the thickest and closest pile of any of them, and sends up but few flower-stalks in proportion to its leaves. It flowers in June, and is ripe in July.

4. *Holcus lanatus*, CREEPING SOFT-GRASS. See AGRICULTURE, no 59.

5. *Alopecurus bulbosus*, BULBOUS FOXTAIL-GRASS, is recommended by Dr Anderson †, as promising on some occasions to afford a valuable pasture-grass. It seems chiefly, he observes, to delight in a moist soil, and therefore promises to be only fit for a meadow pasture grass. The quality that first recommended it to his notice, was the unusual firmness that its matted

roots gave to the surface of the ground, naturally soft and moist, in which it grew; which seemed to promise that it might be of use upon such soils, chiefly in preventing them from being much poached by the feet of cattle which might pasture upon them. Mossy soils especially are so much hurt by poaching, that any thing that promises to be of use in preventing it deserves to be attended to.

6. *Poa pratensis*, GREAT MEADOW-GRASS, seems to approach in many respects to the nature of the purple-fescue; only that its leaves are broader, and not near so long; being only about a foot or 16 inches at their greatest length. Like it, it produces few seed-stalks, and many leaves, and is an abiding plant. It affects chiefly the dry parts of meadows, though it is to be found on most good pastures. It is very retentive of its seeds, and may therefore be suffered to remain till the stalks are quite dry. It blossoms the beginning of June, and its seeds are ripe in July.

7. *Poa compressa*, CREEPING MEADOW-GRASS, according to Dr Anderson, seems to be the most valuable grass of any of this genus. Its leaves are firm and succulent, of a dark Saxon-green colour; and grow so close upon one another, as to form the richest pile of pasture-grass. The flower-stalks, if suffered to grow, appear in sufficient quantities; but the growth of these does not prevent the growth of the leaves, both advancing together during the whole summer; and when the stalks fade, the leaves continue as green as before. Its leaves are much larger and more abundant than the common meadow-grass, *poa trivialis*; and therefore it better deserves to be cultivated.

8. *Anthoxanthum odoratum*, VERNAL GRASS, grows very commonly on dry hills, and likewise on found rich meadow-land. It is one of the earliest grasses we have; and from its being found on such kinds of pastures as sheep are fond of, and from whence excellent mutton comes, it is most likely to be a good grass for sheep-pastures. It gives a grateful odour to hay. In one respect, it is very easy to gather, as it sheds its seeds upon the least rubbing. A correspondent of the Bath Society, however, mentions a difficulty that occurs in collecting them, owing to its being surrounded with taller grasses at the time of its ripening, and being almost hid among them. If it be not carefully watched when nearly ripe, he observes, and gathered within a few days after it comes to maturity, great part of the seed will be lost. The twisted elastic awns, which adhere to the seed, lift them out of their receptacles with the least motion from the wind, even while the straw and ear remain quite erect. It is found mostly in the moist parts of meadows; very little of it on dry pastures. It flowers about the beginning of May, and is ripe about the middle of June.

9. *Cynosurus cristatus*, CRESTED DOG'S-TAIL GRASS. Mr Stillingfleet imagines this grass to be proper for parks, from his having known one, where it abounds, that is famous for excellent venison. He recommends it also, from experience, as good for sheep; the best mutton he ever tasted, next to that which comes from hills where the purple and sheeps fescue, the fine bent, and the silver hair grasses abound, having been from sheep fed with it. He adds, that it makes a very fine turf upon dry sandy or chalky soils: but unless swept over with the scythe, its flowering-stems will look brown.

Grass.

Grass. brown; which is the case of all grasses which are not fed on by variety of animals. For that some animals will eat the flowering-stems is evident by commons, where scarcely any parts of grasses appear but the radical leaves. This grass is said to be the easiest of the whole groupe to collect a quantity of seed from. It flowers in June, and is ripe in July.

10. *Stipa pennata*, COCK'S-TAIL OR FEATHER GRASS.

11. *Agrostis capillaris*, FINE BENT, is recommended by Mr Stillingfleet, from his having always found it in great plenty on the best sheep pastures, in the different counties of England that are remarkable for good mutton. This grass flowers and ripens its seed the latest of them all. It seems to be lost the former part of the year, but vegetates luxuriantly towards the autumn. It appears to be fond of moist ground. It retains its seed till full ripe; flowers the latter end of July, and is ripe the latter end of August.

12. *Arcira flexuosa*, MOUNTAIN HAIR.

13. — *caryophylla*, SILVER HAIR.

The same may be said of these two grasses as of the preceding one.

14. *Festuca fluitans*, FLOTE FESCUE. In a piece published in the *Amœnitates Academicæ*, vol. 3. intitled *Planta Esculenta*, we are informed, that "the seeds of this grass are gathered yearly in Poland, and from thence carried into Germany, and sometimes into Sweden, and sold under the name of *manna seeds*. These are much used at the tables of the great, on account of their nourishing quality and agreeable taste. It is wonderful (adds the author), that amongst us these seeds have hitherto been neglected, since they are so easily collected and cleansed." There is a clamminess on the ear of the flote-fescue, when the seeds are ripe, that tastes like honey; and for this reason perhaps they are called *manna seeds*.

Linnaeus (*Flor. Suec.* art. 95.) says that the bran of this grass will cure horses troubled with botts, if kept from drinking for some hours.

Concerning this grass we have the following information by Mr Stillingfleet. "Mr Dean, a very sensible farmer at Ruscomb, Berkshire, assured me that a field, always lying under water, of about four acres, that was occupied by his father when he was a boy, was covered with a kind of grass, that maintained five farm-horses in good heart from April to the end of harvest, without giving them any other kind of food, and that it yielded more than they could eat. He, at my desire, brought me some of the grass, which proved to be the flote-fescue with a mixture of the marsh-bent; whether this last contributes much towards furnishing so good pasture for horses, I cannot say. They both throw out roots at the joints of the stalks, and therefore are likely to grow to a great length. In the index of dubious plants at the end of Ray's Synopsis, there is mention made of a grass under the name of *gramen caninum supinum longissimum*, growing not far from Salisbury, 24 feet long. This must by its length be a grass with a creeping stalk; and that there is a grass in Wiltshire growing in watery meadows, so valuable, that an acre of it lets from 10 to 12 pounds, I have been informed by several persons. These circumstances incline me think it must be the flote-fescue;

but whatever grass it be, it certainly must deserve to be inquired after."

15. *Alopecurus pratensis*, MEADOW FOXTAIL. Linnaeus says that this is a proper grass to sow on grounds that have been drained.—Mr Stillingfleet was informed, that the best hay which comes to London is from the meadows where this grass abounds. It is scarce in many parts of England, particularly Herefordshire, Berkshire, and Norfolk. It might be gathered at almost any time of the year from hay-ricks, as it does not shed its seeds without rubbing, which is the case of but few grasses. It is amongst the most grateful of all grasses to cattle. It is ripe about the latter end of June.

16. *Poa annua*, ANNUAL MEADOW GRASS. "This grass (says Mr Stillingfleet) makes the finest of turfs. It grows every where by way sides, and on rich sound commons. It is called in some parts the *Suffolk grass*. I have seen whole fields of it in High Suffolk without any mixture of other grasses; and as some of the best salt-butter we have in London comes from that county, it is most likely to be the best grass for the dairy. I have seen a whole park in Suffolk covered with this grass; but whether it affords good venison, I cannot tell, having never tasted of any from it. I should rather think not, and that the best pasture for sheep is also the best for deer. However, this wants trial. I remarked on Malvern-hill something particular in relation to this grass. A walk that was made there for the convenience of the water-drinkers, in less than a year was covered in many places with it, though I could not find one single plant of it besides in any part of the hill. This was no doubt owing to the frequent treading, which above all things makes this grass flourish; and therefore it is evident that rolling must be very serviceable to it. It has been objected, that this grass is not free from *bents*, by which word is meant the flowering-stems. I answer, that this is most certainly true, and that there is no grass without them. But the flowers and stems do not grow so soon brown as those of other grasses; and being much shorter, they do not cover the radical leaves so much; and therefore this grass affords a more agreeable turf without mowing, than any other whatever that I know of."—The seeds of this species drop off before they are dry, and, to appearance, before they are ripe. The utmost care is therefore necessary in gathering the blades, without which, very few of the seeds will be saved. It ripens from the middle of April, to so late, it is believed, as the end of October; but mostly disappears in the middle of the summer. It grows in any soil and situation, but rather affects the shade.

17. A new grass from America (named *Agrostis cornucopia*) was some time ago much advertised and extolled, as possessing the most wonderful qualities, and the seeds of it were sold at the enormous rate of L. 68 the bushel. But we have not heard that it has at all answered expectation. On the contrary, we are informed by Dr Anderson in his new publication †, that "it has upon trial been found to be good for nothing. Of the seeds sown, few of them ever germinated: but enow of plants made their appearance, to ascertain, that the grass, in respect of quality, is among the poorest of the tribe; and that it is an annual plant, and altogether unprofitable to the farmer."

Grass.

Grass.

Grass
||
Grates.

Grass-Walks are made, for the most part, not by sowing grass-seeds, but by laying turfs: and indeed the turfs from a fine common or down are much preferable to sown grass: but if walks or plats are to be made by sowing, the best way is to procure the seed from those pastures where the grass is naturally fine and clear; or else the trouble of keeping it from spiry or benty grass will be very great, and it will scarce ever look handsome.

In order to sow grass walks, the ground must be first dug; and when it has been dressed and laid even, it must be very carefully raked over, and all the clods and stones taken off, and then covered over an inch thick with good mould.

This being done, the seed is to be sown pretty thick, that it may come up close and short; it must then be raked over again, to cover the seed, that if the weather should happen to be windy, it may not be blown away. It ought also to be observed, that where grass is sown in gardens, either for lawns or walks, there should always be a good quantity of the white trefoil or Dutch clover sown with it; for this will make a fine turf much sooner than any other sown grass, and will continue a better verdure than any other of the grass-tribe.

In order to keep grass-plats or walks handsome, and in good order, you may sow in autumn fresh seed over any places that are not well filled, or where the grass is dead: but nothing improves grass so much as mowing and constant rolling.

When turf is laid in gardens, it is a general practice to cover the surface of the ground under the turf, either with sand or very poor earth: the design of this is to keep the grass fine, by preventing its growing too rank. This is proper enough for very rich ground: but it is not so for such land as is middling, or but poor; for when this is practised in such places, the grass will soon wear out and decay in patches.

When turf is taken from a common or down, such ought to be chosen as is free from weeds: and when it is designed to remain for years without renewing, a dressing should be laid upon it every other year, either of very rotten dung, ashes, or, where it can be easily procured, very rotten tan; but these dressings should be laid on early in the winter, that the rain may wash them into the ground, otherwise they will occasion the grass to burn, when the warmth of the summer begins.

When grass is so dressed, and well rolled and mowed, it may be kept very beautiful for many years; but where it is not dressed, or fed with sheep, it will rarely continue handsome more than eight or ten years.

GRASSHOPPER, in zoology, a species of gryllus. See GRYLLUS.

GRATAROLUS (William), a learned physician in the 16th century, was born at Bergamo in Italy; and taught physic with reputation at Padua: but having embraced the Protestant religion, he retired to Switzerland, where he was made professor of physic. He died at Basil in 1568, aged 52. He wrote several curious works in Latin; amongst which are, 1. The manner of preserving and improving the memory. 2. Of preserving in health travellers, men of letters, magistrates, and studious persons, &c.

GRATES for FIRES, are composed of ribs of iron

placed at small distances from one another, so that the air may have sufficient access to the fuel, and the accumulation of the ashes, which would choke the fire, may be prevented.—Grates seem peculiarly adapted to the use of pit-coal, which requires a greater quantity of air to make it burn freely than other kinds of fuel. The hearths of the Britons seem to have been fixed in the centre of their halls, as is yet practised in some parts of Scotland, where the fire is nearly in the middle of the house, and the family sit all around it. Their fire place was perhaps nothing more than a large stone, depressed a little below the level of the ground, and thereby adapted to receive the ashes. About a century ago, it was only the floor of the room, with the addition of a bank or hob of clay. But it was now changed among the gentlemen for a portable fire-pan, raised upon low supporters, and fitted with a circular grating of bars. Such were in use among the Gauls in the first century, and among the Welsh in the tenth.

GRATIAN, the son of Valentinian I. by his first wife, was declared Augustus by his father at the city of Amiens in 365, and succeeded him in 367; a prince equally extolled for his wit, eloquence, modesty, chastity, and zeal against heretics. He associated Theodosius with him in the empire, and advanced the poet Ausonius to the consulate. He made a great slaughter of the Germans at Strasburg*, and hence was surnamed *Alemannicus*. He was the first emperor who refused the title of *Pontifex Maximus*, upon the score of its being a Pagan dignity. He was assassinated by Andragathius in 375, in the 24th year of his age. *See *Argentora*.

GRATIAN, a famous Benedictine monk, in the 12th century, was born at Chiufi, and employed near twenty-four years in composing a work, intitled, *Decretum*, or *Concordantia Discordantium Canonum*, because he there endeavoured to reconcile the canons which seemed contradictory to each other. This work he published in 1151. As he is frequently mistaken, in taking one canon of one council, or one passage of one father, for another, and has often cited false decretals, several authors have endeavoured to correct his faults; and chiefly Anthony Augustine, in his excellent work, intitled, *De emendatione Gratiani*. To the decretals of Gratian, the popes principally owed the great authority they exercised in the thirteenth and following centuries.

GRATINGS, in a ship, are small edges of sawed plank, framed one into another like a lattice or prison grate, lying on the upper deck, between the main-mast and fore-mast, serving for a defence in a close fight, and also for the coolness, light, and conveniency of the ship's company.

GRATIOLA, HEDGE HYSSOP: A genus of the monogynia order, belonging to the diandria class of plants. The corolla is irregular; there are two barren stamina; the capsule is bilocular; the calyx has seven leaves, with the two exterior ones patulous. There are four species; the most remarkable of which is the officinalis, or common hedge-hyssop. This grows naturally on the Alps and other mountainous parts of Europe. It hath a thick, fleshy, fibrous, creeping root, which propagates very much, when planted in a proper soil and situation. From this arise several upright square stalks, garnished with narrow

Gratian

Gratiola.

Gratiola,
Gratitude

Gratitude.

narrow spear-shaped leaves, placed opposite. The flowers are produced on the side of the stalks at each joint; they are shaped like those of the fox glove, but are small, and of a pale yellowish colour.—This herb has an emetic and purgative virtue; to answer which intentions, it was formerly used by the common people in England, but was never much prescribed by the physicians, and at last fell totally into disuse. Of late, however, it has been the subject of a dissertation by Dr James Kofirzewski of Warsaw, in Poland; who gives some remarkable accounts of its effects in mania and obstinate venereal cases. It was given in powder, or in extract, to the quantity of half a drachm of the first, and a whole drachm of the second, at each dose. From the cases related in his dissertation, the author draws the following conclusions: 1. The gratiola may be given with safety both to male and female patients. 2. In all disorders proceeding from a superabundance of serum in the fluids, it appears to be a most effectual remedy. 3. In consequence of this, it is had recourse to with very great advantage in melancholy and mania arising from that state of the system. 4. It powerfully promotes purging, vomiting, sweat, and urine; and is therefore much superior to any of the usual evacuating medicines, most of which prove only active in promoting one of these discharges at once. 5. The most obstinate cases of gonorrhœa, fluor albus, and venereal ulcers, are cured by the powder.—In some instances it has induced salivation; but whether or not it can always be made to produce that effect, is not as yet altogether certain. 6. The powder of gratiola prepared from the extract, and exhibited with sugar, does not induce vomiting; and, on the contrary, the powder of the root always promotes that evacuation.

GRATITUDE, in ethics, a virtue disposing the mind to an inward sense and outward acknowledgment of benefits received.

Examples of ingratitude, Mr Paley observes, check and discourage voluntary beneficence; hence the cultivation of a grateful temper is a consideration of public importance. A second reason for cultivating in ourselves that temper is: That the same principle which is touched with the kindness of a human benefactor, is capable of being affected by the divine goodness, and of becoming, under the influence of that affection, a source of the purest and most exalted virtue. The love of God is the sublimest gratitude. It is a mistake, therefore, to imagine, that this virtue is omitted in the Scriptures; for every precept, which commands us “to love God, because he first loved us,” presupposes the principle of gratitude, and directs it to its proper object.

It is impossible to particularize the several expressions of gratitude, which vary with the character and situation of the benefactor, and with the opportunities of the person obliged; for this variety admits of no bounds. It may be observed, however, that on one part gratitude can never oblige a man to do what is wrong, and what by consequence he is previously obliged not to do: On the other part, it argues a total want of every generous principle, as well as of moral probity, to take advantage of that ascendancy, which the conferring of benefits justly creates, to draw or drive

those whom we have obliged into mean or dishonest compliances.

The following pleasing example of genuine gratitude is extracted from *Hackwel's Apol.* l. 14. c. 10. p. 436. —Francis Frescobald, a Florentine merchant descended of a noble family in Italy, had gained a plentiful fortune, of which he was liberal handed to all in necessity; which being well known to others, though concealed by himself, a young stranger applied to him for charity. Signior Frescobald, seeing something in his countenance more than ordinary, overlooked his tattered clothes; and compassionating his circumstances, asked him “What he was, and of what country?” “I am (answered the young man) a native of England; my name is Thomas Cromwell, and my father-in-law is a poor sheer-man. I left my country to seek my fortune; came with the French army that were routed at Gatylyon, where I was a page to a footman, and carried his pike and burgonet after him.” Frescobald commiserating his necessities, and having a particular respect for the English nation, clothed him genteelly; took him into his house till he had recovered strength by better diet; and, at his taking leave, mounted him upon a good horse, with 16 ducats of gold in his pockets. Cromwell expressed his thankfulness in a very sensible manner, and returned by land towards England; where, being arrived, he was preferred into the service of Cardinal Woolsey. After the Cardinal's death, he worked himself so effectually into the favour of King Henry VIII. that his majesty made him a baron, viscount, earl of Essex, and at last made him lord high chancellor of England. In the mean time, Signior Frescobald, by repeated losses at sea and land, was reduced to poverty; and calling to mind (without ever thinking of Cromwell), that some English merchants were indebted to him in the sum of 15,000 ducats, he came to London to procure payment. Travelling in pursuit of this affair, he fortunately met with the lord chancellor as he was riding to court; who thinking him to be the same gentleman that had done him such great kindness in Italy, he immediately alighted, embraced him, and with tears of joy asked him, If he was not Signior Francis Frescobald, a Florentine merchant? “Yes, Sir (said he), and your most humble servant.” “My servant! (said the Chancellor) No; you are my special friend, that relieved me in my wants, laid the foundation of my greatness, and, as such, I receive you; and, since the affairs of my sovereign will not now permit a longer conference, I beg you will oblige me this day with your company at my house to dinner with me.” Signior Frescobald was surprised and astonished with admiration who this great man should be that acknowledged such obligations, and so passionately expressed a kindness for him: but, contemplating a while his voice, his mien, and carriage, he concludes it to be Cromwell, whom he had relieved at Florence; and therefore not a little overjoyed, goes to his house, and attended his coming. His lordship came soon after; and immediately taking his friend by the hand, turns to the lord high admiral and other noblemen in his company, saying, “Don't your lordships wonder that I am so glad to see this gentleman? This is he who first contributed to my advancement.” He

Gratitude. then told them the whole story; and, holding him still by the hand, led him into the dining-room, and placed him next himself at table. The company being gone, the Chancellor made use of this opportunity to know what affair had brought him into England. Frescobald in few words gave him the true state of his circumstances: To which Cromwell replied, "I am sorry for your misfortunes, and I will make them as easy to you as I can; but, because men ought to be just before they are kind, it is fit I should repay the debt I owe you." Then leading him into his closet, he locked the door; and opening a coffer, first took out 16 ducats, delivering them to Frescobald, and said, "My friend, here is the money you lent me at Florence, with ten pieces you laid out for my apparel, and ten more you paid for my horse; but, considering you are a merchant, and might have made some advantage by this money in the way of trade, take these four bags, in every one of which is 400 ducats, and enjoy them as the free gift of your friend." These the modesty of Frescobald would have refused, but the other forced them upon him. He next caused him to give him the names of all his debtors, and the sums they owed: which account he transmitted to one of his servants, with a charge to find out the men, and oblige them to pay him in 15 days under the penalty of his displeasure; and the servant so well discharged his duty, that in a short time the entire sum was paid. All this time Signior Frescobald lodged in the Chancellor's house, where he was entertained according to his merits, with repeated persuasions for his continuance in England, and an offer of the loan of 60,000 ducats for four years if he would trade here: but he desired to return to Florence, which he did, with extraordinary favours from the Lord Cromwell.

There is a species of grateful remorse, which sometimes has been known to operate forcibly on the minds of the most hardened in impudence. Of this Mr Andrews, who makes the remark, gives an instance in the following anecdote, said to have been a favourite one with the late Dr Campbell. "Towards the beginning of this century, an actor, celebrated for mimicry, was to have been employed by a comic author, to take off the person, the manner, and the singularly awkward delivery of the celebrated Dr Woodward, who was intended to be introduced on the stage in a laughable character, (viz. in that of *Dr Fossile*, in *Three Hours after Marriage*). The mimic dressed himself as a country man, and waited on the Doctor with a long catalogue of ailments, which he said attended on his wife. The physician heard with amazement diseases and pains of the most opposite nature, repeated and redoubled on the wretched patient. For, since the actor's greatest wish was to keep Dr Woodward in his company as long as possible, that he might make the more observations on his gestures, he loaded his poor imaginary spouse with every infirmity which had any probable chance of prolonging the interview. At length, being become completely master of his errand, he drew from his purse a guinea, and, with a scrape, made an uncouth offer of it. 'Put up thy money, poor fellow' (cried the Doctor); 'thou hast need of all thy cash and all thy patience too, with such a bundle of diseases tied to thy back.' The actor returned to his employer, and recounted the whole conversation,

Nº 143.

with such true feeling of the physician's character, that the author screamed with approbation. His raptures were soon checked; for the mimic told him, with the emphasis of sensibility, that he would sooner die than prostitute his talents to the rendering such genuine humanity a public laughing-stock. The player's name was *Griffin*."

GRATZ, a handsome strong town of Germany, and capital of Styria, with a castle seated on a rock, and an university. The Jesuits have a college here; and there are a great number of handsome palaces, and a fine arsenal. The castle stands on a very lofty hill, and communicates with the river by means of a deep well. The empress-dowager was obliged to retire hither during the war of 1741 and 1742. It is seated on the river Muer, in E. Long. 16. 25. N. Lat. 47. 4.

GRATIUS, a Latin poet, cotemporary with Ovid, the author of a poem intitled *Cynegeticon*, or the *Manner of hunting with dogs*; the best edition of which is that of Leyden, 12mo, with the learned notes of Janus Ulitius.

GRAVE, in grammar, a species of accent opposite to acute. The grave accent is expressed thus ('); and shows, that the voice is to be depressed, and the syllable over which it is placed pronounced in a low deep tone.

GRAVE, in music, is applied to a sound which is in a low or deep tone. The thicker the chord or string, the more grave the tone or note, and the smaller the acuter. Notes are supposed to be the more grave, in proportion as the vibrations of the chord are less quick.

GRAVE, in the Italian music, serves to denote the slowest movement.

GRAVE is also used for a tomb, wherein a person deceased is interred.

Graves, among the Jews, were generally out of the city, though we meet with instances of their interring the dead in towns. Frequent mention is made of graves upon mountains, in highways, in gardens, and private houses. So that nothing on this head seems to have been determined. The same may be observed with respect to the Greeks. The Thebans had a law that every person who built an house should provide a burial-ground. Men who had distinguished themselves were frequently buried in the public forum. The most general custom was, however, to bury out of the city, chiefly by the highway side. The Romans were forbidden by the law of the 12 tables to bury or burn the dead in the city; but some we find had their sepulchres in Rome, though they paid a fine for the indulgence.

GRAVE, a very strong town of the Netherlands, in Dutch Brabant, seated on the river Maese, beyond which there is a fort. E. Long. 5. 41. N. Lat. 51. 46.

GRAVEL, in natural history and gardening, a congeries of pebbles, which, mixed with a stiff loam, makes lasting and elegant gravel-walks; an ornament peculiar to our gardens, and which gives them an advantage over those of other nations.

GRAVEL, in medicine. See the Index subjoined to that article; and see **ALKALI**, nº 17.

GRAVEL-Walks. To make these properly, the bottom should be laid with lime-rubbish, large flint-stones,

Gratz
||

Gravel
||
Grave-
fande.

or any other hard matter, for eight or ten inches thick, to keep weeds from growing through, and over this the gravel is to be laid six or eight inches thick. This should be laid rounding up in the middle, by which means the larger stones will run off to the sides, and may be raked away; for the gravel should never be screened before it is laid on. It is a common mistake to lay these walks too round, which not only makes them uneasy to walk upon, but takes off from their apparent breadth. One inch in five feet is a sufficient proportion for the rise in the middle; so that a walk of 20 feet wide should be four inches higher at the middle than at the edges, and so in proportion. As soon as the gravel is laid, it should be raked, and the large stones thrown back again: then the whole should be rolled both lengthwise and crosswise; and the person who draws the roller should wear shoes with flat heels, that he may make no holes; because holes made in a new walk are not easily remedied. The walks should always be rolled three or four times in very hard showers, after which they will bind more firmly than otherwise they could ever be made to do.

Gravel, with some loam among it, binds more firmly than the rarer kinds; and when gravel is naturally very harsh and sharp, it is proper to add a mixture of loam to it. The best gravel for walks is such as abounds with smooth round pebbles, which, being mixed with a little loam, are bound so firmly together, that they are never afterwards injured either by wet or dry weather. These are not so liable to be turned up by the feet in walking, as the more irregularly shaped pebbles, and remain much more firmly in their places after rolling.

GRAVELINES, a very strong sea-port town of the Netherlands in French Flanders, with a castle and harbour. It was ceded to France by the treaty of the Pyrenees, and is seated in a marshy country on the river Aa, near the sea, in E. Long. 2. 13. N. Lat. 50. 59.

GRAVELLY LAND, or SOIL, that abounding with gravel or sand, which easily admits of heat and moisture; and the more stony such lands are, the more barren they prove.

GRAVENAC, a town of Germany, in the circle of Suabia, and capital of a county of the same name. E. Long. 8. 15. N. Lat. 48. 22.

GRAVER, in the art of engraving, a tool by which all the lines, scratches, and shades, are cut in copper, &c. See ENGRAVING.

GRAVESANDE (William James), was born of an ancient and honourable family at Delft in Holland, in 1688. He studied the civil law at Leyden, but mathematical learning was his favourite amusement. When he had taken his doctor's degree in 1707, he settled at the Hague, and practised at the bar, in which situation he cultivated an acquaintance with learned men; with a society of whom, he published a periodical review intitled *Le Journal Littéraire*, which was continued without interruption from the year 1713 to the year 1722, when he died. The most considerable of his works are, "A treatise on perspective; An introduction to the Newtonian philosophy, or a treatise on the elements of physics confirmed by experiments; A treatise on the elements of algebra, for the use of young students;" and "A course of logic and

Vol. VIII. Part I.

metaphysics." He had intended to have presented the public with a system of morality, but his death prevented the execution. The ministers of the republic consulted him on all occasions wherein his talents were requisite; and his skill in calculation was often of service to them; as was his address in decyphering, for detecting the secret correspondence of their enemies. As professor of mathematics and astronomy at Leyden, none ever applied the powers of nature with more success, or to more useful purposes.

GRAVESEND, a town of Kent in England, situated on the banks of the Thames. It is 23 miles from London; and has a blockhouse well mounted with cannon, to command the ships and river, directly opposite to Tilbury fort in Essex. The town was plundered and burnt by the French and Spaniards in the reign of Richard II. to compensate which, the king, at the request of the abbot of St Mary-le-Grace of Tower-hill, to whom he had granted a manor there called *Parrocks*, vested it and Milton with the sole privilege of carrying passengers by water from hence to London at 4s. the whole fare, or 2d. a head; which was confirmed by Henry VIII.; but now the fare is 9d. a head in the tilt-boat, and 1s. in the wherry. The former must not take in above 40 passengers, the latter no more than 8. Coaches ply here at the landing of people from London, &c. to carry them to Rochester, at 1s. 6d. each. This town and Milton were incorporated by queen Elizabeth by the name of the *portreeve* (now the mayor), jurats, and inhabitants of Gravesend and Milton: And, as Gravesend is the place where most passengers through Kent from foreign parts take boat for London, that queen, in order to show the grandeur of the metropolis of her kingdom, ordered the lord mayor, aldermen, and city companies, to receive all ambassadors and eminent strangers here in their formalities, and to attend them to London in barges if by water; or if they choose to come by land, they were to meet them on horseback on Blackheath in their livery-gowns. The towns for several miles round are supplied from hence with garden stuffs; of which great quantities are also sent to London, where the asparagus of Gravesend is preferred to that of Battersea. All outward-bound ships are obliged to anchor in this road till they have been visited by the custom-house officers; and for this purpose a centinel at the block-house fires a musket: but the homeward-bound all pass by without notice, unless it be to put waiters on board, if they are not supplied before. As the outward-bound generally take in provisions here, the place is full of seamen, who are all in a hurry. The whole town being burnt down in 1727, 5000l. was granted by the parliament in 1731 for rebuilding its church, as one of the 50 new ones. In 1624, one Mr Pinnock gave 21 dwelling-houses here, besides one for a master weaver, to employ the poor; and here is a charity-school for 24 boys, who are both taught and cloathed. The town-house was erected in 1764; and in 1772 an act of parliament empowered the inhabitants to pave and light their streets.

GRAVINA, a town of Italy, in the kingdom of Naples, and Terra di Bori, with a bishop's see, and the title of a duchy. E. Long. 17. N. Lat. 41.

GRAVINA (John Vincent), an eminent scholar, and illustrious lawyer of Italy, born at Roggiana in

P

1664.

Gray.

1664. He was professor of the canon law in the college of Sapienzi at Rome; and though many foreign universities made proposals to draw him to them, he never quitted that city, but died there in 1718. His works are both curious and useful; the greatest of them is *De ortu et progressu Juris Civilis*. A collection of his works was printed in 4to at Leipzig in 1737, with the notes of Mascovius.

GRAVINA (Peter), an Italian poet, much esteemed by the great general Gonsalvo, and Prosper Colonna. He wrote, in a pure Roman style, Discourses on Matters relating to the Law and to the Belles Lettres, as well as Poems. He died in 1527.

GRAVITATION, in natural philosophy, is sometimes distinguished from *gravity*. Thus M. Maupertuis takes gravity for that force whereby a body would fall to the earth; but gravitation for the same diminished by the centrifugal force. See *NEWTONIAN Philosophy*.

GRAVITY, or GRAVITATION (for the words are most commonly used synonymously), signifies either the force by which bodies are pressed towards the surface of the earth, or the manifest effect of that force; in which last sense the word has the same signification with *weight* or *heaviness*.

Concerning gravity in the first sense of the word, or that active power by which all bodies are impelled towards the earth, there have been great disputes. Many eminent philosopher, and among the rest Sir Isaac Newton himself, have considered it as the first of all second causes; an incorporeal or spiritual substance, which never can be perceived any other way than by its effects; an universal property of matter, &c. Others have attempted to explain the phenomena of gravitation by the action of a very subtle ethereal fluid; and to this explanation Sir Isaac, in the latter part of his life, seems not to have been averse. He hath even given a conjecture concerning the matter in which this fluid might occasion these phenomena. But for a full account of the discoveries of this great philosopher concerning the laws of gravitation, the conjectures made by him and others concerning its cause, the various objections that have been made to his doctrine, and the state of the dispute at present, see the articles *NEWTONIAN Philosophy*, *ASTRONOMY*, *ATMOSPHERE*, *EARTH*, *ELECTRICITY*, *FIRE*, *LIGHT*, *ATTRACTION*, *REPULSION*, *PLENUM*, *VACUUM*, &c.

Specific GRAVITY, denotes the weight belonging to an equal bulk of every different substance. Thus the exact weight of a cubic inch of gold, compared with a cubic inch of water, tin, lead, &c. is called its *specific gravity*. See *HYDROSTATICS*.

GRAUNT (John), author of a curious and celebrated book, intitled, *Natural and Political Observations made upon the Bills of Mortality*. He was a haberdasher of small wares; but laid down his trade, and all public employments, on account of his religion. He was educated a puritan; afterwards professed himself a Socinian; yet in the latter part of his life declared himself of the Roman Catholic religion. He was a member of the royal society, and died in 1674.

GRAY, or GREY, a mixed colour partaking of the two extremes, black and white. See *BLACK*, n° 8, 9, 10. and *DYEING*, n° 82, and 90.

In the manege they make several sorts of grays;

as the branded or blackened gray, which has spots quite black dispersed here and there. The dappled gray, which has spots of a darker colour than the rest of the body. The light or silver gray, wherein there is but a small mixture of black hairs. The sad or iron gray, which has but a small mixture of white. And the brownish or sandy coloured gray, where there are bay-coloured hairs mixed with the black.

GRAY, a town of France, in the Franche Compté, and capital of the bailiwick of Amont. It is a trading place, and seated on the river Saone, in E. Long 5. 41. N. Lat. 47. 30.

GRAY (Lady Jane). See GREY.

GRAY (Thomas), an admired English poet, was the youngest and only surviving son of a reputable citizen of London, and was born in Cornhill in 1716. He was educated at Eton, where he contracted a friendship with Mr Horace Walpole, and with Mr Richard West son of the lord chancellor of Ireland. Mr West and Mr Gray were both intended for the bar; but the former died early in life, and the latter was diverted from that pursuit by an invitation to accompany Mr Walpole in his travels; which he accepted without any determined plan for his future life. During Mr Gray's travels, he wrote a variety of letters to Mr West and to his parents, which are printed with his poems; and when he returned, finding himself in narrow circumstances, yet with a mind indisposed for active employment, he retired to Cambridge, and devoted himself to study. Soon after his return, his friend West died: and the melancholy impressed on him by this event may be traced in his admired "Elegy written in a country churchyard;" which is thought to have been begun, if not finished, at this time: though the conclusion, as it stands at present, is certainly different from what it was in the first manuscript copy. The first impulse of his sorrow for the death of his friend gave birth to a very tender sonnet in English, on the Petrarchian model; and also to a sublime apostrophe in hexameters, written in the genuine strain of classical majesty, with which he intended to begin one of his books *De Principiis cogitandi*.

From the winter of the year 1742, to the day of his death, his principal residence was at Cambridge: from which he was seldom absent any considerable time, except between the years 1759 and 1762; when, on the opening of the British Museum, he took lodgings in Southampton-row, in order to have recourse to the Harleian and other manuscripts there deposited, from which he made several curious extracts, amounting in all to a tolerable-sized folio, at present in the hands of Mr Walpole.

About the year 1747, Mr Mason, the editor of Mr Gray's poems, was introduced to him. The former had written, a year or two before, some imitations of Milton's juvenile poems, viz. A Monody on the death of Mr Pope, and two pieces intitled *Il Bellicoso* and *Il Pacifico* on the peace of Aix-la-Chapelle; and the latter revised them, at the request of a friend. This laid the foundation of an intimacy which continued without interruption to the death of Mr Gray.

About the year 1750, Mr Gray had put his last hand to his celebrated Elegy written in a country church-yard, and had communicated it to his friend Mr Walpole, whose good taste was too much charmed with

Gray.

Gray. with it to suffer him to withhold the sight of it from his acquaintance. Accordingly it was shown about for some time in manuscript, and received with all the applause it so justly merited. At last the publisher of one of the magazines having obtained a surreptitious copy of it, Mr Gray wrote to Mr Walpole, desiring that he would put his own manuscript into the hands of Mr Doddsley, and order him to print it immediately. This was the most popular of all our author's publications. It ran through eleven editions in a very short space of time; was finely translated into Latin by Messrs Anstey and Roberts; and in the same year by Mr Lloyd.

From July 1759 to the year 1762, he generally resided in London, with a view, as we have already observed, of having recourse to the British Museum. In July 1768, his grace the duke of Grafton wrote him a polite letter, informing him, that his majesty had been pleased to offer to him the professorship of Modern History in the university of Cambridge, then vacant by the death of Mr Laurence Bocket. This place was valuable in itself, the salary being 400 l. a year; but what rendered it particularly acceptable to Mr Gray was its being given him without any solicitation. He was indeed remarkably disinterested in all his pursuits. Though his income, before this addition, was very small, he never read or wrote with a view of making his labours useful to himself. He may be said to have been of those few personages in the annals of literature, especially in the poetical class, who are devoid of self interest, and at the same time attentive to economy; and also was among mankind in general one of those very few economists, who possess that talent, untinged with the slightest stain of avarice. When his circumstances were at the lowest, he gave away such sums in private charity, as would have done credit to an ampler purse. But what chiefly deterred him from seeking any advantage by his literary pursuits, was a certain degree of pride, which led him to despise the idea of being thought an author by profession.

However, it is probable, that early in life he had an intention of publishing an edition of Strabo; for his papers contain a great number of notes and geographical disquisitions on that author, particularly with respect to that part of Asia which comprehends Persia and India. The indefatigable pains which he took with the writings of Plato, and the quantity of critical as well as explanatory observations which he has left upon almost every part of his works, plainly indicate, that no man in Europe was better prepared to republish and illustrate that philosopher than Mr Gray. Another work, on which he bestowed uncommon labour, was the Anthologia. In an interleaved copy of that collection of Greek epigrams, he has transcribed several additional ones, which he selected in his extensive reading; has inserted a great number of critical notes and emendations, and subjoined a copious index. But whether he intended this performance for the press or not, is uncertain. The only work which he meditated upon with this direct view from the beginning was a history of English poetry, upon a plan sketched out by Mr Pope. He has mentioned this himself in an advertisement to those three fine imitations of Norse and Welch poetry, which he gave the

world in the last edition of his poems. But after he had made some considerable preparations for the execution of this design, and Mr Mason had offered him his assistance, he was informed, that Mr Warton, of Trinity College, Oxford, was engaged in a work of the same kind. The undertaking was therefore relinquished, by mutual consent; and soon after, on that gentleman's desiring a sight of the plan, our author readily sent him a copy of it.

Among other sciences, Mr Gray had acquired a great knowledge of Gothic architecture. He had seen and accurately studied in his youth, while abroad, the Roman proportions on the spot, both in ancient times, and in the works of Palladio. In his later years he applied himself to consider those stupendous structures of more modern date that adorn our own country; which, if they have not the same grace, have undoubtedly equal dignity. He endeavoured to trace this mode of building from the time it commenced through its various changes, till it arrived at its perfection in the reign of Henry VIII. and ended in that of Elizabeth. For this purpose, he did not so much depend upon written accounts, as that internal evidence which the buildings themselves give of their respective antiquity; since they constantly furnish to the well informed eye, arms, ornaments, and other marks, by which their several ages may be ascertained. On this account he applied himself to the study of heraldry as a preparatory science; and has left behind him a number of genealogical papers, more than sufficient to prove him a complete master of it. By these means he arrived at so very extraordinary a pitch of sagacity, as to be enabled to pronounce, at first sight, on the precise time when every particular part of any of our cathedrals was erected. But the favourite study of Mr Gray for the last ten years of his life was natural history, which he then rather resumed than began; as by the instructions of his uncle Antrobus, he was a considerable botanist at 15. The marginal notes which he has left on Linnæus and other writers on the vegetable, animal, and fossile kingdoms, are very numerous: but the most considerable are on Hudson's *Flora Anglica*, and the tenth edition of the *Systema Naturæ*; which latter he interleaved and filled almost entirely. While employed on zoology, he read Aristotle's treatise on that subject with great care, and explained many difficult passages of that obscure ancient by the lights he had received from modern naturalists. In a word, excepting pure mathematics, and the studies dependent on that science, there was hardly any part of human learning in which he had not acquired a competent skill, and in most of them a consummate mastery. To this account of his literary character we may add, that he had a fine taste in painting, prints, gardening, and music; and was moreover a man of good-breeding, virtue, and humanity.

He died in 1771; and an edition of his poems, with memoirs of his life and writings, were published in 4to, in 1775, by Mr Mason. This gentleman, however, instead of employing his own pen in drawing Mr Gray's character, has adopted one drawn by the Rev. Mr Temple, rector of Mamhead in Devonshire, in a letter to Mr Boswell; to whom the public are indebted for communicating it. "Perhaps (says Mr Temple) he was the most learned man in Europe. He was equally acquainted

Gray
||
Great

with the elegant and profound parts of science, and that not superficially but thoroughly. He knew every branch of history, both natural and civil; had read all the original historians of England, France, and Italy: and was a great antiquarian. Criticism, metaphysics, morals, politics, made a principal part of his plan of study; voyages and travels of all sorts were his favourite amusement; and he had a fine taste in painting, prints, architecture, and gardening. With such a fund of knowledge, his conversation must have been equally instructing and entertaining; but he was also a good man, a well-bred man, a man of virtue and humanity. There is no character without some speck, some imperfection; and I think the greatest defect in his was an affectation in delicacy, or rather effeminacy, and a visible fastidiousness, or contempt and disdain of his inferiors in science. He also had, in some degree, that weakness which disgusted Voltaire so much in Mr Congreve: though he seemed to value others chiefly according to the progress they had made in knowledge, yet he could not bear to be considered himself merely as a man of letters; and though without birth, or fortune, or station, his desire was to be looked upon as a private independent gentleman, who read for his amusement. Perhaps it may be said, What signifies so much knowledge, when it produces so little? Is it worth taking so much pains to leave no memorial but a few poems? But let it be considered, that Mr Gray was, to others, at least innocently employed; to himself, certainly beneficially. His time passed agreeably; he was every day making some new acquisition in science; his mind was enlarged, his heart softened, and his virtue strengthened; the world and mankind were shown to him without a mask; and he was taught to consider every thing as trifling, and unworthy the attention of a wise man, except the pursuit of knowledge, and the practice of virtue in that state wherein God hath placed us."

GRAYLING, in ornithology, a species of SALMO.

In angling for this fish your hook must be armed upon the shanks with a very narrow plate of lead, which should be slenderest at the bent of the hook, that the bait (which is to be a large grasshopper, the uppermost wing of which must be pulled off) may come over to it the more easily. At the point let there be a cad-bait in a continual motion. The jag-tail, which is a worm of a pale flesh-colour, with a yellow tag on its tail, is an excellent bait for the grayling in March and April.

GREASE, a swelling and gourdianness of the legs of a horse. See FARRIERY, § xxxvi.

GREAT, a term of comparison, denoting a thing to have more extension than some other to which it is referred. Thus we say, a *great* space, a *great* distance, a *great* figure, a *great* body, &c.

GREAT is likewise used figuratively in matters of morality, &c. to signify ample, noble, elevated, extraordinary, important, &c. Thus we say, Shakespeare was a *great* genius, Da Vinci a *great* painter, Galileo a *great* philosopher, Bossu a *great* critic, &c.

GREAT is also a title or quality appropriated to certain princes and other illustrious personages. Thus we say, the *great* Turk, the *great* Mogul, the *great* cham of Tartary, the *great* duke of Florence, &c.

GREAT is also a surname bestowed on several kings

and emperors. Thus we say, Alexander the *great*; Cyrus the *great*; Charles the *great*, or Charlemagne; Henry the *great* of France, &c.

GREAT is also applied to several officers who have pre-eminence over others. Thus we say, the lord *great* chamberlain; the *great* marshal of Poland, &c.

GREATER TONE, in music. See TONE.

GREAVES (John), an eminent physician and antiquary, was the eldest son of John Greaves rector of Colemore, near Alresford in Hampshire, and born in 1602. He was educated at Baliol College in Oxford, from which he removed to Merton. He was afterwards, on the foot of his great merit, chosen geometry professor of Gresham college. His ardent thirst of knowledge soon carried him into several parts of Europe, where he eagerly seized every opportunity of improving it. His next voyage was into the eastern countries; where nothing remarkable in the heavens, earth, or even subterraneous places, seems to have escaped his nice observation. He, with indefatigable industry, and even at the peril of his life, collected a considerable number of Arabic, Persian, and Greek, manuscripts, for archbishop Laud. Of these he well knew the value, as he was a master of the languages in which they were written. He also collected for that prelate many oriental gems and coins. He took a more accurate survey of the pyramids than any traveller who went before him. On his return from the East, he visited several parts of Italy a second time. During his stay at Rome, he made a particular inquiry into the true state of the ancient weights and measures. Soon after he had finished his second voyage, he was chosen Savilian professor of astronomy at Oxford. He was eminently qualified for this professorship, as the works of ancient and modern astronomers were familiar to him. His books relating to oriental learning, his *Pyramidographia*, or a description of the pyramids in Egypt, his *Epocha Celebriorum*, and other curious and useful pieces, of which Mr Ward has given us a catalogue, show him to have been a great man. Those which he intended to publish would have shown him to be a greater; but he was stopped in his great career by death in 1652.

GREBE, in ornithology. See COLYMBUS.

GREECE, the present Rumelia, and in many respects one of the most deservedly celebrated countries in the world, was anciently bounded on the north by Macedonia and the river Strymon; on the west by the Ionian sea; on the south by the Mediterranean; on the east by the Egean sea and Archipelago. It extended from the Strymon, by which it was parted from Thrace, to the promontory of Tenarus, the southmost point of the Peloponnesus, now the Morea, about 6° 20' of latitude, or nearly 440 English miles, and in breadth from east to west about 359 miles.

The general names by which the inhabitants of this country were known to the ancients were those of *Graioi*, or *Graicoi*, from whence the name of *Greece* is plainly derived. These names are thought to come from Græcus, the father, or (according to some) the son, of Thessalus, who gave name to Thessaly; but some modern critics choose to derive it from *Ragau*, the same with *Reu*, the son of Peleg, by the transposition of a letter to soften the sound.—These names were afterwards changed for *Achai* and *Hellenes*; the first, as is supposed,

Great
||
Greec.

Greece. supposed, from *Achæus*, the son of *Xuthus*, the son of *Hellen*, and father of *Ion*; or, according to the fable, the son of *Jupiter*: the other from *Hellen*, above-mentioned, the son of *Deucalion*, and father of *Dorus*, from whom came the *Dores*, afterwards a famous nation among the Greeks. — Another name by which the Greeks were known in some parts of the country, was that of *Pelasgi*, which the *Arcadians*, the most ancient people in Greece, deduced from their pretended founder *Pelasgus*; who is said to have got such footing in *Peloponnesus*, that the whole peninsula from him was called *Pelasgia*. But the most ancient name of all is universally allowed to have been that of *Iones*, which the Greeks themselves derived from *Ion* the son of *Xuthus*; or, as the fable hath it, of *Apollo*, by *Creusa* the daughter of *Erichtheus* the grandson of *Deucalion*. *Josephus*, however, affirms, that their original is of much older date; and that *Javan*, the son of *Japhet*, and grandson of *Noah*, was the first who peopled these countries; which *Bochart* hath also rendered very probable. It is true, indeed, that among the Greeks themselves, only the *Athenians*, and such colonies as sprung from them, were called *Iones*: but it is also plain beyond exception, that other nations gave this name to all the inhabitants of Greece.

The inhabitants of Greece in the first ages, even by the confession of their own historians, appear to have been savages scarce a degree removed from brutes. They lived indifferently on every fruit, herb, or root that came in their way; and lay either in the open fields, or at best sheltered themselves in dens, caves, and hollow trees; the country itself in the mean time remaining one continued uncultivated desert. — The first improvement they made in their way of living, was the exchanging of their old food for the more wholesome acorns, building huts for themselves to sleep in, and covering their bodies with the skins of beasts. For all this, it seems, they were beholden to *Pelasgius* above-mentioned (supposed by some to be *Peleg* spoken of in Scripture), and who was highly revered by them on that account. — This reformation in their way of life, however, it seems wrought none in their manners. On the contrary, they who had nothing to fight for but a hole to sleep in, began now to envy and rob one another of these slender acquisitions. This, in process of time, put them under a necessity of joining themselves into companies under some head, that they might either more safely plunder their neighbours, or preserve what they had got. Laws they had none, except that of the sword: so that those only lived in safety who inhabited the most barren and craggy places; and hence Greece for a long time had no settled inhabitants, the weakest being always turned out by the strongest. Their gigantic size and strength, if we may believe *Plutarch*, added so much to their insolence and cruelty, that they seemed to glory in committing the greatest acts of violence and barbarity on those that unhappily fell into their hands.

The next advance towards civilization, was their forming themselves into regular societies, to cultivate the lands, and build themselves towns and cities for their safety. Their original barbarity and mutual violences against each other naturally prevented them from uniting as one nation, or even into any considerable community: and hence the great number of states in-

to which Greece was originally divided. The most remarkable of these small principalities mentioned in history are the following: In *Peloponnesus* were those of *Sicyon*, *Argos*, and *Messenia*, *Achaia Propria*, *Arcadia*, and *Laconia*. In *Grecia Propria* (that part of Greece which lay without *Peloponnesus*), were those of *Attica*, *Megara*, *Bœotia*, *Locris*, *Epichnemidia*, *Doris*, *Phocis*, *Locris*, *Ozolæa*, and *Ætolia*. In *Epirus* were the *Molossi*, *Amphilochi*, *Cassiopæi*, *Dræopes*, *Chaoces*, *Threspotii*, *Almeni*, and *Acar-nani*. In *Thessaly* were those of *Thessaliotis*, *Esti-otis*, *Pelasgiotis*, *Magnesia*, and *Phthia*. — All these have at one time or other been severally governed by kings of their own, though we only find the names of many of them mentioned in the histories of the more considerable kingdoms of *Sparta*, *Attica*, *Thebes*, &c. — The erection of these kingdoms, however, for some time, did not much alter the case; the inhabitants of the new kingdoms plundered and destroyed one another without mercy. *Attica* was the only place in any degree free from these incursions, because it was naturally destitute of every thing that could invite a plundering enemy; but those cities fared much worse which were situated on the sea-coasts; because they were in continual danger of being plundered either by sea or land: for pirates at that time did not less infest all those seas than robbers did the land. And this was one main cause why most of the ancient cities of Greece were situated at some considerable distance from the shore; but even in these, as all their safety consisted in the resistance they could make against an invader, their inhabitants were under a necessity of going constantly armed, and being ever on their guard.

Another mischief arising from these continual piracies and robberies was, that they occasioned the far greater part of the lands to lie uncultivated, so that the people only planted and sowed as much as was barely necessary for their present support; and where there was such an universal neglect of agriculture, there could be as little room for any discoveries in other useful arts and trades. Hence, when other nations, as the *Jews*, *Egyptians*, *Midianites*, *Phœnicians*, &c. had improved themselves to a very high degree, the Greeks seem to have been utter strangers to every useful art.

During this period of savage barbarity, the most renowned Grecian heroes, as *Hercules*, *Theseus*, &c. performed their exploits; which, however exaggerated by poetic fiction, no doubt had a foundation in truth. Some indeed are of opinion that the Grecian heroes are entirely fictitious, and their exploits derived from those of the Hebrew worthies, such as *Samson*, *Gideon*, &c. Yet, considering the extreme degree of barbarity which at that time prevailed throughout Greece, it seems not at all improbable that some persons of extraordinary strength and courage might undertake the cause of the oppressed, and travel about like the more modern knights-errant in quest of adventures.

The first expedition in which we find the Greeks united, was that against *Troy*, the particulars of which are recited under the article *TROY*. Their success here (which happened about 1184 B. C.) cost them very dear; vast numbers of their bravest warriors being slain; great numbers of the survivors being cast away.

Greece.

away in their return; and many of those who had the good luck to get back again, being soon after murdered, or driven out of their country. It is probable, however, that their having staid for such a long time in Asia, might contribute to civilize the Greeks somewhat sooner than what they otherwise would have been; and accordingly from this time, we find their history somewhat less obscure, and as it were beginning to emerge out of darkness. The continual wars, indeed, in which they were engaged among themselves, no doubt, for a long time, prevented them from making any considerable progress in those arts in which they afterwards made so great progress. These wars, which indeed never ceased as long as the Greeks preserved their liberty, rendered them brave, and skilled in the military art, above all other nations; but at the same time they effectually prevented them from making permanent conquests, and confined them within the bounds of their own country; while the different states were one way or other so equally balanced, that scarce one of them was able perfectly to subdue another. The Spartans, however, having, with great difficulty, reduced the kingdom of Messene, and added its territories to their own, became the leading people in Greece. Their superiority was long disputed by Athens; but the Peloponnesian war at last determined that point in favour of the Spartans, when the city of Athens was taken, and its walls demolished by Lysander the Spartan general. See *ATTICA*, n° 164. — By the battle of Leuctra, the Spartans lost that superiority which they had maintained for 500 years, and which now devolved on the Thebans. After the death of Epaminondas, the celebrated Theban general, however, as no person was found possessed of his abilities, the Thebans were again obliged to yield the superiority to the Spartans. But by this time the Greeks had become acquainted with the luxuries and elegancies of life; and all the rigour of their original laws could not prevent them from valuing these as highly as other people. This did not indeed abate their valour, but it heightened their mutual animosities; at the same time that, for the sake of a more easy and comfortable life, they became more disposed to submit to a master. The Persians, whose power they had long dreaded, and who were unable to resist them by force of arms, at last found out (by the advice of Alcibiades) the proper method of reducing the Grecian power; namely, by assisting them by turns, and supplying one state with money to fight against another, till they should all be so much reduced, that they might become an easy prey. Thus the Greeks were weakened, though the Persians did not reap any benefit from their weakness. Philip of Macedon entered into the same political views; and partly by intrigue, partly by force, got himself declared Generalissimo of Greece. His successor Alexander the Great completed their subjection; and by destroying the city of Thebes, and exterminating its inhabitants, struck such a terror throughout Greece, that he was as fully obeyed by all the states as by any of the rest of his subjects. During his absence in Persia, however, they attempted to shake off the Macedonian yoke, but were quelled by his general Antipater. The news of Alexander's death was to them a matter of the utmost joy; but their mutual animosities prevented them

from joining in any solid plan for the recovery of their liberties, and hence they continued to be oppressed by Alexander's successors, or other tyrants, till Aratus, an Achæan, about 268 B. C. formed a design of setting his country free from these oppressors. He persuaded a number of the small republics to enter into a league for their own defence, which was called the *Achæan league*; and notwithstanding that the republics, taken singly, had very little strength, they not only maintained their independency, but soon became formidable when united. This association continued to become daily more and more powerful; but received a severe check from Cleomenes, king of Sparta, which obliged them to call in Antigonus to their assistance. This prince overcame Cleomenes at the battle of Sellasia, and afterwards made himself master of Sparta. Thus he became a more formidable enemy than the one he had conquered, and the recovery of the Grecian liberties was incomplete.

Soon after this, the Greeks began to feel the weight of a power more formidable than any which they had yet experienced; namely, that of the Romans. That insidious and haughty republic first intermeddled with the Grecian affairs, under pretence of setting them at liberty from the oppression of Philip of Macedon. This, by a proper union among themselves, they might have accomplished: but in this they acted as though they had been infatuated; receiving with the utmost joy the decree of the Roman consul, who declared them free; without considering, that he who had thus given them liberty, might take it away at his pleasure. This lesson, however, they were soon taught, by the total reduction of their country to a Roman province; yet this can scarce be called a misfortune, when we look back to their history, and consider their outrages upon one another: nor can we sympathize with them for the loss of that liberty which they only made use of to fill their country with slaughter and bloodshed. After their conquest by the Romans, they made no united effort to recover their liberty. They continued in quiet subjection till the beginning of the 15th century. About that time, they began to suffer under the tyranny of the Turks, and their sufferings were completed by the taking of Constantinople in 1453. Since that time, they have groaned under the yoke of a most despotic government; so that all traces of their former valour, ingenuity, and learning, are now in a manner totally extinct.

Modern Greece comprehends Macedonia; Albania, now called *Arnaut*; Epirus; Thessaly, now *Jana*; Achaia, now *Livadia*; the Peloponnesus, now *Morea*; together with the islands on its coast, and in the Archipelago. The continent of Greece is seated betwixt the 36th and 43d degrees of north latitude; and between the 19th and 27th degrees of longitude, east of London. To the north it is bounded, by Bulgaria and Servia, from which it is divided by a ridge of mountains; to the south, by the Mediterranean sea; to the east, by Romania and the Archipelago; and to the west, by the Adriatic, or gulph of Venice. Its length is said to be about 400 miles, and its utmost breadth about 350 miles. The air is extremely temperate and healthy; and the soil fruitful, though badly cultivated; yielding corn, wine, delicious fruits, and abounding with cattle, fowls, and venison. As to religion.

Greece.

Greece. ligion, Christianity was planted in Greece soon after the death of our Saviour, and flourished there for many ages in great purity; but since the Greeks became subject to the Turkish yoke, they have sunk into the most deplorable ignorance, in consequence of the slavery and thralldom under which they groan, and their religion is now greatly corrupted. It is indeed little better than a heap of ridiculous ceremonies and absurdities. The head of the Greek church is the patriarch of Constantinople; who is chosen by the neighbouring archbishops and metropolitans, and confirmed by the emperor or grand vizir. He is a person of great dignity, being the head and director of the eastern church. The other patriarchs are those of Jerusalem, Antioch, and Alexandria. Mr Tournefort tells us, that the patriarchates are now generally set to sale, and bestowed upon those who are the highest bidders. The patriarchs, metropolitans, archbishops, and bishops, are always chosen from among the Caloyers or Greek monks. Before the patriarchs receive their patents and the castan, which is a vest of linsley-woolsey, or some other stuff, presented by the grand signior to ambassadors and other persons newly invested with some considerable dignity, they are obliged to make large presents to the vizir, &c. The income of the patriarch of Constantinople is said to amount to no less than one hundred and twenty thousand guilders, of which he pays the one half by way of annual tribute to the Ottoman Porte, adding six thousand guilders besides as a present at the feast of Bairam. The next person to a bishop among the clergy is an archimandrite, who is the director of one or more convents, which are called *mandren*; then come the abbot, the arch-priest, the priest, the deacon, the under-deacon, the chanter, and the lecturer. The secular clergy are subjected to no rules, and never rise higher than high-priest. They are allowed to marry once; but it must be with a virgin, and before they are ordained. They have neither glebe nor tythes, but depend on the perquisites that arise from their office; and they seldom preach but in Lent. The Greeks have few nunneries; but a great many convents of monks, who are all priests, and, students excepted, obliged to follow some handicraft employment, and lead a very austere life. The Greeks deny the supremacy of the pope, and abhor the worship of images; but have a multitude of pictures of saints in their churches, whom they pray to as mediators. Their fasts are very severe. They believe also in the doctrine of transubstantiation, and that the Holy Ghost does not proceed from the Son. They admit not of purgatory, says Mr Thevenot: but yet they allow a third place, where they say the blessed remain, in expectation of the day of judgment. At mass they consecrate with leavened bread; and communicate under both kinds, as well laies as priests, and as well women and children as men. When they carry the sacrament to the sick, they do not prostrate themselves before it, nor expose it to be adored: neither do they carry it in procession, or have any particular feast in honour of it. Baptism is performed among them by plunging the whole body of the child thrice into water. Immediately after baptism, they give it confirmation and the communion; and seven days after that, it undergoes the ceremony of ablution. When a priest is married, among other ce-

remories, the bridegroom and bride drink each two glasses of wine; then the glass is given to the priest, who merrily drinks off the rest of the wine, and breaking the glass, says, So may the bridegroom break the virginity of the bride. As to the character of the modern Greeks, they are said to be very covetous, hypocritical, treacherous, great pederasts, and at the same time revengeful to the highest degree; but very superstitious. They are so much despised by the Turks, that these do not value even a Greek who turns Mahometan. The Turks are remarkable for their taciturnity; they never use any unnecessary words: but the Greeks, on the contrary, are very talkative and lively. The Turks generally practise what their religion enjoins, but the Greeks do not; and their misery puts them upon a thousand mean shifts and scandalous practices, authorized by bad example, and perpetuated from father to son. The Greek women have fine features and beautiful complexions: their countenances still very much resemble those of the ancient Greek statues.

GREEK, or GRECIAN, any thing belonging to ancient Greece.

The Greek language, as preserved in the writings of the celebrated authors of antiquity, as Homer, Hesiod, Demosthenes, Aristotle, Plato, Xenophon, &c. has a great variety of terms and expressions, suitable to the genius and occasions of a polite and learned people, who had a taste for arts and sciences. In it, proper names are significative; which is the reason that the modern languages borrow so many terms from it. When any new invention, instrument, machine, or the like, is discovered, recourse is generally had to the Greek for a name to it; the facility wherewith words are there compounded, affording such as will be expressive of its use: such are, barometer, hygrometer, microscope, telescope, thermometer, &c. But of all sciences, medicine most abounds with such terms; as diaphoretic, diagnosis, diarrhoea, hæmorrhage, hydrophobia, phthisis, atrophy, &c. Besides the copiousness and significancy of the Greek, wherein it excels most, if not all, other languages, it has also three numbers, viz. a singular, dual, and plural: also a abundance of tenses in its verbs, which makes a variety in discourse, prevents a certain dryness that always accompanies too great an uniformity, and renders that language peculiarly proper for all kinds of verse. The use of the participles, of the aorist and preterite, together with the compound words already mentioned, give it a peculiar force and brevity without taking any thing from its perspicuity.

It is no easy matter to assign the precise difference between the modern and ancient Greek; which consists in the terminations of the nouns, pronouns, verbs, &c. not unlike what obtains between some of the dialects of the Italian or Spanish. There are also in the modern Greek many new words, not to be met with in the ancient. We may therefore distinguish three ages of the Greek tongue: the first of which ends at the time when Constantinople became the capital of the Roman empire; the second lasted from that period to the taking of Constantinople by the Turks; and the third from that time to this.

GREEK Bible. See BIBLE.

GREEK Church, is that part of the Christian church which

*Greece,
Greek.*

Greek
Green-
house.

which is established in Greece; extending likewise to some other parts of Turkey. See GREECE.—It is thus called in Europe, Asia, and Africa, in contradistinction from the Latin or Romish church; as also the Eastern church, in distinction from the Western.

The Romanists call the Greek church the *Greek schism*; because the Greeks do not allow the authority of the pope, but depend wholly, as to matters of religion, on their own patriarchs. They have treated them as schismatics ever since the revolt, as they call it, of the patriarch Photius.

GREEK Monks and Nuns, of whatever order, consider St Basil as their founder and common father, and esteem it the highest crime to deviate in the least from his constitutions. There are several beautiful convents with churches, in which the monks perform divine service day and night. Some of the monks are cœnobites, or live together, wear the same habit, eat at the same table, and perform the same exercises and employments.

GREEK Orders, in architecture, are the Doric, Ionic, and Corinthian; in contradistinction to the two Latin orders, the Tuscan and Composite. See ORDER.

GREEN, one of the original prismatic colours, exhibited by the refraction of the rays of light. See CHROMATICS and COLOUR.

GREEN, among painters and dyers. See COLOUR-Making, n° 27. and DYEING, n° 93—95.

GREEN-Cloth, a board or court of justice held in the compting-house of the king's household, composed of the Lord Steward and officers under him, who sit daily. To this court is committed the charge and oversight of the king's household in matters of justice and government, with a power to correct all offenders, and to maintain the peace of the verge, or jurisdiction of the court-royal; which is every way about 200 yards from the last gate of the palace where his majesty resides.

It takes its name, *board of green cloth*, from a green cloth spread over the board where they sit.

Without a warrant first obtained from this court, none of the king's servants can be arrested for debt.

Clerks of the GREEN Cloth were two officers of the board of green cloth, who appointed the diet of the king and his household; and kept all records, legers, and papers relating thereto; made up bills, parcels, and debentures for salaries, and provisions and necessaries for the officers of the buttry, pantry, cellar, &c. They also waited upon foreign princes when entertained by his majesty. But this has been lately abolished.

GREEN Finch, in ornithology, the English name of the greenish fringilla, with the wings and tail variegated with yellow. See FRINGILLA.

GREEN-House, or *Conservatory*, a house in a garden, contrived for sheltering and preserving the most curious and tender exotic plants, which in our climate will not bear to be exposed to the open air, especially during the winter season. These are generally large and beautiful structures, equally ornamental and useful.

The length of greenhouses must be proportioned to the number of plants intended to be preserved in them, and cannot therefore be reduced to rule: but their depth should never be greater than their height in the clear; which, in small or middling houses, may be 16 or 18 feet, but in large ones from 20 to 24 feet; and

N° 144.

the length of the windows should reach from about one foot and a half above the pavement, and within the same distance of the cieling, which will admit of a cornice round the building over the heads of the windows. Their breadth cannot be in proportion to their length; for if in the largest buildings they are more than seven or seven feet and a half broad, they will be extremely heavy and inconvenient. The piers between the windows must be as narrow as may be to support the building; for which reason they should either be of stone or of hard burnt bricks. If the piers are made of stone, they should be 30 inches wide in front, and sloped off behind to about 18 inches, by which means there will be no corners to take off the rays of the sun. If they are of brick, they will require to be at least three feet in front, but they should be in the same manner sloped off behind. Over the greenhouse may be rooms for drying and preserving seeds, roots, &c. and behind it a place for tools and other purposes; and both these behind, and the rooms above, will be of great use in keeping off the frosts, so that the wall between these need not be of more than two bricks and a half in thickness.

The floor of the greenhouse, which should be laid either with Bremen squares, Purbeck stone, or flat tiles, must be raised two feet above the surface of the adjoining ground, or if the situation be damp, at least three feet; and if the whole is arched with low brick arches under the floor, they will be of great service in preventing damp; and under the floor, about two feet from the front, it will be very advisable to make a flue of ten inches wide and two feet deep; this should be carried the whole length of the house, and then returned back along the hinder part, and there be carried up into funnels adjoining to the tool-house, by which the smoke may be carried off. The fire-place may be contrived at one end of the house, and the door at which the fuel is put in, as also the ash-grate, may be contrived to open into the tool-house, and the fuel being laid in the same place, the whole will be out of sight. Bradley advises, that the front of greenhouses, in the colder parts of England, be built in a sweep or semicircle, so that one part or other of it may receive the sun's rays all day. The use of fires must, however, be very sparing in this place; and it is not one winter in three or four that will require them in any part, only when the weather is very severe, and the frost cannot well be kept out any other way, this is an expedient that is good to have in readiness, as it may save a whole house of plants. Within side of the windows, in front of the greenhouse, there should be good strong shutters, made with hinges, to fold back close to the piers, that they may not obstruct the rays of the sun. The back part of the house should be either laid over with stucco or plastered with mortar, and whitewashed, in order to prevent the frosty air from penetrating through the walls. When the greenhouse is wainscotted, the walls should be plastered with lime and hair behind the wainscot, to keep out the cold; and the wainscot, as well as the cieling, and every part within the house, should be painted white, for the reflection of the sun's rays. There must be a number of trellises with forms of wood upon them, to support the pots of plants; the tallest to be placed hindmost, the lowest within four feet of the windows: and

Green-
house.

^{Green.} the rows of plants should rise gradually, so that the heads of the second row should be entirely above the first; and behind them there should be a space of at least five feet, for the convenience of watering the plants, and for a free circulation of air. It has been observed, that the placing of the euphorbiums, cereuses, and other succulent plants among orange-trees, and other common greenhouse-plants, is always destructive of them, by making them receive an improper sort of effluvia, which plants of that kind imbibe very freely. They should therefore be placed in two wings built at each end of the greenhouse; which, if well contrived, will be a great beauty as well as use to the building. These wings may be made capable of a greater warmth also by more flues, and may be made to contain a hot-bed of tanners bark for the raising many of the tender plants, natives of warm climates.

Whilst the front of the greenhouse is exactly south, one of the wings may be made to face the south-east and the other the south-west. By this disposition the heat of the sun is reflected from one part of the building to the other all day, and the front of the main greenhouse is guarded from the cold winds. These two wings may be so contrived as to maintain plants of different degrees of hardiness, which may be easily effected by the situation and extent of the fire-place, and the manner of conducting the flues: the wing facing the south-east is evidently the most proper for the warmest stove; this may be divided in the middle by a partition of glass, with glass-doors opening from one division to the other. In each of these there should be a fire-place, with flues carried up against the back-wall, through which the smoke should be made to pass as many times the length of the house as the height will admit of the number of flues; for the longer the smoke is in passing, the more heat will be given to the house with a less quantity of fuel. The other wing, facing the south-west, should be divided and furnished with flues in the same manner; and thus different degrees of heat may be obtained, according to the seasons and the particular sorts of plants that are to be preserved. If there are no sheds behind these wings, the walls should not be less than three bricks thick; and the back part, having sloping roofs, which are covered with tiles or slates, should be lined with reeds, &c. under the covering. The sloping glasses of these houses should be made to slide and take off, so that they may be drawn down more or less in warm weather to admit air to the plants; and the upright glasses in front may be so contrived as that every other may open as doors upon hinges, and the alternate glasses may be divided into two: the upper part of each should be so contrived as to be drawn down like shades, so that either of them may be used to admit air in a greater or less quantity as there may be occasion.

As to the management of the plants herein, Mortimer recommends the opening of the mould about them from time to time, and sprinkling a little fresh mould in them, and a little warm dung on that; as also to water them when the leaves begin to wither and curl, and not oftener, which would make them fade and be sickly; and to take off such leaves as wither and grow dry.

GREEN-Sickness (Chlorosis). See Index subjoined to MEDICINE.

VOL. VIII. Part I.

GREEN-Silver, the name of an ancient custom within ^{Greenland.} the manor of Writtel in the county of Essex in England; which is, that every tenant whose fore-door opens to Greenbury shall pay an half-penny yearly to the lord, by the name of *green-silver*.

GREEN-Wax, is used where estates are delivered to the sheriffs out of the exchequer, under the seal of that court, made in green wax, to be levied in the several counties. This word is mentioned the 43d stat. Ed. III. c. 9. and 7 Hen. IV. c. 4.

GREENLAND, a general name by which are ^{West} denoted the most easterly parts of America, stretching ^{Greenland} towards the north pole, and likewise some islands to ^Idescribed. the northward of the continent of Europe, lying in very high latitudes.

This country is divided into West and East Greenland.—West Greenland is now determined by our latest maps to be a part of the continent of America, though upon what authority is not very clear. That part of it which the Europeans have any knowledge of is bounded on the west by Baffin's Bay, on the south by Davis's Straits, and on the east by the northern part of the Atlantic Ocean. It is a very mountainous country, and some parts of it so high that they may be discerned 30 leagues off at sea. The inland mountains, hills, and rocks, are covered with perpetual snow; but the low lands on the sea-side are clothed with verdure in the summer season. The coast abounds with inlets, bays, and large rivers; and is surrounded with a vast number of islands of different dimensions. In a great many places, however, on the eastern coast especially, the shore is inaccessible by reason of the floating mountains of ice. The principal river, called *Baal*, falls into the sea in the 64th degree of latitude, where the first Danish lodge was built in 1721; and has been navigated above 40 miles up the country.

West Greenland was first peopled by Europeans in the eighth century. At that time a company of Icelanders, headed by one Ericke Rande, were by accident driven on the coast. On his return he represented the country in such a favourable light, that some families ²Peopled by again followed him thither, where they soon became a ^{a colony} thriving colony, and bestowed on their new habitation ^{from Ice-} the name of *Groenland*, or *Greenland*, on account of its ^{land.} verdant appearance. This colony was converted to Christianity by a missionary from Norway, sent thither by the celebrated Olaf, the first Norwegian monarch who embraced the true religion. The Greenland settlement continued to increase and thrive under his protection; and in a little time the country was provided with many towns, churches, convents, bishops, &c. under the jurisdiction of the archbishop of Drontheim. A considerable commerce was carried on between Greenland and Norway; and a regular intercourse maintained between the two countries till the year 1406, when the last bishop was sent over. From that time all correspondence ³All corre- was cut off, and all knowledge of Greenland has been ^{spondence} buried in oblivion. ^{with it sud-}

This strange and abrupt cessation of all trade and intercourse has been attributed to various causes; but the most probable is the following. The colony, from its first settlement, had been harassed by the natives, a barbarous and savage people; agreeing in customs, garb, and appearance, with the Esquimaux found about Hudson's Bay. This nation, called *Schrellings*, ^{at}

Q

⁴ **Greenland.** at length prevailed against the Iceland settlers who inhabited the western district, and exterminated them in the 14th century: infomuch, that when their brethern of the eastern district came to their assistance, they found nothing alive but some cattle and flocks of sheep running wild about the country. Perhaps they themselves afterwards experienced the same fate, and were totally destroyed by these Schrellings, whose descendants still inhabit the western parts of Greenland, and from tradition confirm this conjecture. They affirm that the houses and villages, whose ruins still appear, were inhabited by a nation of strangers, whom their ancestors destroyed. There are reasons, however, for believing that there may be still some descendants of the ancient Iceland colony remaining in the eastern district, though they cannot be visited by land, on account of the stupendous mountains, perpetually covered with snow, which divide the two parts of Greenland; while they have been rendered inaccessible by sea, by the vast quantity of ice driven from Spitzbergen, or East Greenland. One would imagine that there must have been some considerable alteration in the northern parts of the world since the 15th century, so that the coast of Greenland is now become almost totally inaccessible, though formerly visited with very little difficulty. It is also natural to ask, By what means the people of the eastern colony surmounted the above-mentioned obstacles when they went to the assistance of their western friends; how they returned to their own country; and in what manner historians learned the success of their expedition? Concerning all this we have very little satisfactory information.

⁵ **Account of the colony.** All that can be learned from the most authentic records is, that Greenland was divided into two districts, called *West Bygd* and *East Bygd*: that the western division contained four parishes and 100 villages: that the eastern district was still more flourishing, as being nearer to Iceland, sooner settled, and more frequented by shipping from Norway. There are also many accounts, though most of them romantic and slightly attested, which render it probable that part of the eastern colony still subsists, who, at some time or other, may have given the imperfect relation above mentioned. This colony, in ancient times, certainly comprehended twelve extensive parishes, one hundred and ninety villages; a bishop's see, and two monasteries. The present inhabitants of the western district are entirely ignorant of this part, from which they are divided by rocks, mountains, and deserts, and still more effectually by their apprehension: for they believe the eastern Greenlanders to be a cruel, barbarous nation, that destroy and eat all strangers who fall into their hands. About a century after all intercourse between Norway and Greenland had ceased, several ships were sent successively by the kings of Denmark in order to discover the eastern district; but all of them miscarried. Among these adventurers, Mogens Heinson, after having surmounted many difficulties and dangers, got sight of the land; which, however, he could not approach. At his return, he pretended that the ship was arrested in the middle of her course by certain

⁶ **Attempts to rediscover the country.**

rocks of loadstone at the bottom of the sea. The Greenland same year, 1576, in which this attempt was made, has been rendered remarkable by the voyage of Captain Martin Frobisher, sent upon the same errand by Queen Elizabeth. He likewise descried the land; but could not reach it, and therefore returned to England; yet not before he had sailed sixty leagues in the strait which still retains his name, and landed on several islands, where he had some communication with the natives. He had likewise taken possession of the country in the name of Queen Elizabeth; and brought away some pieces of heavy black stone, from which the refiners of London extracted a certain proportion of gold. In the ensuing spring he undertook a second voyage, at the head of a small squadron, equipped at the expence of the public; entered the straits a second time; discovered upon an island a gold and silver mine; bestowed names upon different bays, islands, and headlands; and brought away a lading of ore, together with two natives, a male and a female, whom the English kidnapped.

Such was the success of this voyage, that another armament was fitted out under the auspices of Admiral Frobisher, consisting of 15 sail, including a considerable number of soldiers, miners, smelters, carpenters, and bakers, to remain all the winter near the mines in a wooden fort, the different pieces of which they carried out in the transports. They met with boisterous weather, impenetrable fogs, and violent currents upon the coast of Greenland, which retarded their operations until the season was far advanced. Part of their wooden fort was lost at sea; and they had neither provision nor fuel sufficient for the winter. The admiral therefore determined to return with as much ore as he could procure: of this they obtained large quantities out of a new mine, to which they gave the name of the Countess of Suffex. They likewise built an house of stone and lime, provided with ovens; and here, with a view to conciliate the affection of the natives, they left a quantity of small morrice-bells, knives, beads, looking-glasses, leaden pictures, and other toys, together with several loaves of bread. They buried the timber of the fort where it could be easily found next year; and sowed corn, pease, and other grain, by way of experiment, to know what the country would produce. Having taken these precautions, they sailed from thence in the beginning of September; and after a month's stormy passage, arrived in England: but this noble design was never prosecuted.

Christian IV. king of Denmark, being desirous of discovering the old Greenland settlement, sent three ships thither, under the command of Captain Godske Lindenow; who is said to have reached the east coast of Greenland, where he traded with the savage inhabitants, such as they are still found in the western district, but saw no signs of a civilized people. Had he actually landed in the eastern division, he must have perceived some remains of the ancient colony, even in the ruins of their convents and villages. Lindenow kidnapped two of the natives, who were conveyed to Copenhagen; and the same cruel fraud (A) was practised

(A) Nothing can be more inhuman and repugnant to the dictates of common justice than this practice of tearing away poor creatures from their country, their families, and connections: unless we suppose them altogether

Greenland. tified by other two ships which sailed into Davis's Straits, where they discovered divers fine harbours, and delightful meadows covered with verdure. In some places they are said to have found a considerable quantity of ore, every hundred pounds of which yielded twenty-six ounces of silver. The same Admiral Lindenow made another voyage to the coast of Greenland in the year 1606, directing his course to the westward of Cape Farewell. He coasted along the Straits of Davis; and having made some observations on the face of the country, the harbours and islands, returned to Denmark. Carsten Richards, being detached with two ships on the same discovery, descried the high land on the eastern side of Greenland; but was hindered by the ice from approaching the shore.

Other expeditions of the same nature have been planned and executed with the same bad success, under the auspices of a Danish company of merchants. Two ships returned from the western part of Greenland loaded with a kind of yellow sand, supposed to contain a large proportion of gold. This being assayed by the goldsmiths of Copenhagen, was condemned as useless, and thrown overboard: but from a small quantity of this sand, which was reserved as a curiosity, an expert chemist afterwards extracted a quantity of pure gold. The captain, who brought home this adventure, was so chagrined at his disappointment, that he died of grief, without having left any directions concerning the place where the sand had been discovered. In the year 1654, Henry Moller, a rich Dane, equipped a vessel under the command of David de Nelles, who sailed to the west coast of Greenland, from which he carried off three women of the country. Other efforts have been made, under the encouragement of the Danish king, for the discovery and recovery of the old Iceland colony in Greenland: but all of them miscarried, and people began to look upon such expeditions as wild and chimerical. At length the Greenland company at Bergen in Norway, transported a colony to the western coast, about the 64th degree of latitude; and these Norwegians sailed in the year 1712, accompanied by the Reverend Hans Egede, to whose care, ability, and precision, we owe the best and most authentic account of modern Greenland. This gentleman endeavoured to reach the eastern district, by coasting southwards, and advanced as far as the States Promontory: but the season of the year, and continual storms, obliged him to return; and as he could not even find the Strait of Frobisher, he con-

cluded that no such place ever existed. In the year 1724, a ship, being equipped by the company, sailed on this discovery, with a view to land on the east side opposite to Iceland; but the vast shoals of ice, which barricaded that part of the coast, rendered this scheme impracticable. His Danish majesty, in the year 1728, caused horses to be transported to Greenland, in hope that the settlers might by their means travel over land to the eastern district; but the icy mountains were found impassable. Finally, lieutenant Richards, in a ship which had wintered near the new Danish colony, attempted, in his return to Denmark, to land on the eastern shore; but all his endeavours proved abortive.

Mr Egede is of opinion, that the only practicable method of reaching that part of the country, will be to coast north-about in small vessels, between the great flakes of ice and the shore; as the Greenlanders have declared, that the currents continually rushing from the bays and inlets, and running south-westwards along the shore, hinder the ice from adhering to the land; so that there is always a channel open, through which vessels of small burden might pass, especially if lodges were built at convenient distances on the shore, for the convenience and direction of the adventurers.

That part of the country which is now visited and settled by the Danes and Norwegians, lies between the 64th and 68th degrees of north latitude; and thus far it is said the climate is temperate. In the summer, which continues from the end of May to the middle of September, the weather is warm and comfortable, while the wind blows easterly; though even at this time storms frequently happen, which rage with incredible violence; and the sea-coasts are infested with fogs that are equally disagreeable and unhealthy. Near the shore, and in the bays and inlets, the low land is clothed with the most charming verdure: but the inland mountains are perpetually covered with ice and snow. To the northward of the 68th degree of latitude the cold is prodigiously intense; and towards the end of August all the coast is covered with ice, which never thaws till April or May, and sometimes not till the latter end of June. Nothing can exhibit a more dreadful, and at the same time a more dazzling, appearance, than those prodigious masses of ice that surround the whole coast in various forms, reflecting a multitude of colours from the sun-beams, and calling to mind the enchanted scenes of romance. Such prospects they yield in calm weather; but when the wind

Mr Egede's
account of
the coun-
try.

Q 2

begins

gether destitute of natural affection; and that this was not the case with those poor Greenlanders, some of whom were brought alive to Copenhagen, appears from the whole tenor of their conduct, upon their first capture, and during their confinement in Denmark. When first captivated, they rent the air with their cries and lamentations: they even leaped into the sea; and, when taken on board, for some time refused all sustenance. Their eyes were continually turned towards their dear country, and their faces always bathed in tears. Even the countenance of his Danish majesty, and the caresses of the court and people, could not alleviate their grief. One of them was perceived to shed tears always when he saw an infant in the mother's arms; a circumstance from whence it was naturally concluded, that he had left his wife with a young child in Greenland. Two of them went to sea in their little canoes in hope of reaching Greenland; but one of them was retaken. Other two made the same attempt; but were driven by a storm on the coast of Schonen, where they were apprehended by the peasants, and reconveyed to Copenhagen. One of them afterwards died of a fever, caught in fishing pearl, during the winter, for the governor of Kolding. The rest lived some years in Denmark; but at length, seeing no prospect of being able to revisit their native country, they sunk into a kind of melancholy disorder, and expired.

Greenland. begins to blow, and the waves to rise in vast billows, the violent shocks of those pieces of ice dashing against one another fill the mind with horror.—Greenland is seldom visited with thunder and lightning, but the *Aurora Borealis* is very frequent and bright. At the time of new and full moon, the tide rises and falls upon this coast about three fathoms; and it is remarkable, that the springs and fountains on shore rise and fall with the flux and reflux of the ocean.

The soil of Greenland varies like that of all other mountainous countries. The hills are very barren, being indeed frozen throughout the whole year; but the valleys and low grounds, especially near the sea, are rich and fruitful. The ancient Norwegian chronicles inform us, that Greenland formerly produced a great number of cattle; and that considerable quantities of butter and cheese were exported to Norway; and, on account of their peculiar excellency, set a part for the king's use. The same histories inform us, that some parts of the country yielded excellent wheat; and that large oaks were found here, which carried acorns as big as apples. Some of these oaks still remain in the southern parts, and in many places the marks of ploughed land are easily perceived. At present, however, the country is destitute of corn and cattle, though in many places it produces excellent pasture; and, if properly cultivated, would probably yield grain also. Mr Egede sowed some barley in a bay adjoining to the Danish colony. It sprang up so fast, that by the latter end of July it was in the full ear; but being nipped by a night-frost, it never arrived at maturity. This seed was brought from Bergen, where the summer is of greater heat and duration than in Greenland; but in all probability the corn which grows in the northern parts of Norway would also thrive here. Turnips and coleworts of an excellent taste and flavour are also produced here. The sides of the mountains near the bays are clothed with wild thyme, which diffuses its fragrance to a great distance. The herb tormentil is very common in this country, and likewise many others not described by the botanists. Among the fruits of Greenland we number juniper-berries, blue-berries, bil-berries, and bramble-berries.

Greenland is thought to contain many mines of metal, though none of them are wrought. To the southward of the Danish colony are some appearances of a mine of copper. Mr Egede once received a lump of ore from one of the natives; and here he found calamine of a yellow colour. He once sent a considerable quantity of sand of a yellow colour, intermixed with streaks of vermilion, to the Bergen company. They probably found their account in this present; for they desired him by a letter to procure as much of that sand as possible: but he was never able to find the place where he saw the first specimen. It was one of the smallest among a great number of islands; and the mark he had set up was blown down by a violent storm. Possibly this might be the same mineral of which Captain Frobisher brought so much to England. This country produces rock-crystals both red and white, and whole mountains of the asbestos or incombustible flax. Around the colony, which is known by the name of *Good Hope*, they find a kind of bastard marble of various colours, which the natives form into

bowls, lamps, pots, &c. All that has been said of Greenland, the fertility of Greenland, however, must be understood only of that part which lies between the 60th and 65th degrees of latitude. The most northern parts are totally destitute of herbs and plants. The wretched inhabitants cannot find grass in sufficient quantities to stuff into their shoes to keep their feet warm, but are obliged to buy it from those who inhabit the more southern parts.

The animals which abound most in Greenland are, rein-deer, foxes, hares, dogs, and white bears. The hares are of a white colour, and very fat; the foxes are of different colours, white, greyish, and bluish; and smaller than those of Denmark and Norway. The natives keep a great number of dogs, which are large, white, or speckled, and rough, with ears standing upright, as is the case with all the dogs peculiar to cold climates. They are timorous and stupid; and neither bay nor bark, but sometimes howl dismally. In the northern parts the natives yoke them in sledges; which, though heavy laden, they will draw on the ice at the rate of 70 miles in a short winter's day. These poor animals are very ill rewarded for their service; being left to provide for themselves, except when their masters happen to catch a great number of seals. On these occasions the dogs are regaled with the blood and entrails; at other times they subsist, like wild beasts, upon muscles and berries. Here also are found great numbers of ravens, eagles of a prodigious size, falcons, and other birds of prey; and likewise a kind of linnet, which warbles very melodiously. Whales, sword-fish, porpoises, &c. abound on the coasts; also holybut, turbot, cod, haddock, &c. The more dubious animals also, called *mermaids*, *sea-serpents*, and *krakens*, said to be found on the coast of Norway, are said likewise to dwell in these seas. Mr Egede assures us, that, in the year 1734, the sea-serpent was seen off the new Danish colony, and raised its head mast high above the surface of the water. See *KRAKEN*, *MERMAID*, and *Sea-Serpent*.

The people who now inhabit the western coast of Greenland, and who, without doubt, are the descendants of the ancient *Schrellings*, who exterminated the first Iceland colony, bear a near resemblance to the Samoiedes and Laplanders in their persons, complexions, and way of life. They are short, brawny, and inclined to corpulency; with broad faces, flat noses, thick lips, black hair and eyes, and a yellowish tawney complexion. They are for the most part vigorous and healthy, but remarkably short-lived; few of them reaching the grand climacteric; and many dying in their infancy, and in the prime of youth. They are subject to a weakness in the eyes, occasioned by the piercing winds and the glare of the snow in the winter-time. The leprosy is known among them, but is not contagious. Those that dwell in the northern parts are miserably tormented with dysenteries, rheums, and pulmonary disorders, boils, and epilepsy. The small-pox being imported among them from Copenhagen in the year 1734, made terrible havoc among these poor people, who are utterly destitute of any knowledge of the medicinal art, and depend entirely for assistance upon their *angekuts* or conjurers. In their dispositions the Greenlanders are cold, phlegmatic, indolent, and slow of apprehension; but very quiet, orderly, and good.

Greenland. good-natured. They live peaceably together; and have every thing in common, without strife, envying, or animosity. They are civil and hospitable, but slovenly to a degree almost beyond the Hottentots themselves. They never wash themselves with water; but lick their paws like the cat, and then rub their faces with them. They eat after their dogs without washing their dishes; devour the lice which devour them; and even lick the sweat, which they scrape off from their faces with their knives. The women wash themselves with their own urine, which they imagine makes their hair grow; and in the winter-time go out immediately after, to let the liquor freeze upon their skin. They will often eat their victuals off the dirty ground, without any vessel to hold them in; and devour rotten flesh with the greatest avidity. In times of scarcity they will subsist on pieces of old skin, reeds, sea-weed, and a root called *tugloronet*, dressed with train oil and fat. The dung of rein-deer taken from the intestines, the entrails of partridges, and all sorts of offals, are counted dainties among these savages; and of the scrapings of seals skins they make delicate pan-cakes. At first they could not taste the Danish provisions without abhorrence; but now they are become extremely fond of bread and butter, though they still retain an aversion to tobacco and spirituous liquors; in which particular they differ from almost all savages on the face of the earth.

The Greenlanders commonly content themselves with one wife; who is condemned, as among other savage nations, to do all the drudgery, and may be corrected, or even divorced, by the husband at pleasure. Heroes, however, and extraordinary personages, are indulged with a plurality of wives. Their young women are generally chaste and bashful; but at some of their feasts, in the midst of their jollity, a man retires with his neighbour's wife behind a curtain made of skins; and all the guests, thus coupled, retire in their turns. The women think themselves happy if an angekut or prophet will thus honour them with his caresses. These people never marry within the prohibited degrees of consanguinity, nor is it counted decent in a couple to marry who have been educated in the same family.—They have a number of ridiculous and superstitious customs; among which the two following are the most remarkable. While a woman is in labour, the gossips hold a chamber-pot over her head, as a charm to hasten the delivery. When the child is a year old, the mother licks and slabbers it all over, to render it, as she imagines, more strong and hardy.

All the Greenlanders hitherto known speak the same language, though different dialects prevail in different parts of the country. It abounds with double consonants; and is so guttural, that the pronunciation of many words is not to be learned except by those who have been accustomed to it from their infancy. The letters C, D, F, Q, and X, are not known in their alphabet. Like the North Americans, and inhabitants of Kamtschatka, they have a great number of long polysyllables. Their words, nouns as well as verbs, are inflected at the end by varying the terminations without the help of articles; but their language being found defective, they have adopted a good many words from the Norwegian dialect. Notwithstanding the endeavours of the Danish missionaries,

they have no great reason to boast of the proselytes they have made of the natives of Greenland. These savages pay great deference and respect to the Danes, whom indeed they obey as their masters, and bear the truths of the Christian religion expounded without doubting the veracity of their teachers; but at the same time they listen with the most mortifying indifference, without being in the least influenced by what they have heard. They believe in the immortality of the soul, and the existence of a spirit whom they call *Torngarsuk*; but of whom they have formed the most ridiculous notions. The Angekuts, who are supposed to be his immediate ministers, differ concerning the principles of his existence; some affirming that he is without form or shape; others, that he has the shape of a bear; others, that he has a large human body with only one arm; while others affirm that he is no larger than a man's finger, with many other absurdities of a similar kind. They have also a peculiar kind of mythology, by which they believe all the elements to be full of spirits, from among which every one of their prophets is supplied with a familiar which they name *Torngack*, and who is always ready when summoned to his assistance.

The Greenlanders are employed all the year round either in fishing or hunting. At sea they pursue the whales, morfes, seals, fish for eating, and sea-fowl. On shore they hunt the rein-deer in different parts of the country. They drive these animals, which feed in large herds, into a narrow circle or defile, where they are easily slain with arrows. Their bow is made of fir-tree, wound about with the twisted sinews of animals: the string is composed of the same stuff, or of seal skin: the arrow is a good fathom in length, pointed with a bearded iron, or a sharp bone; but those with which they kill birds are blunt, that they may not tear the flesh. Sea-fowls they kill with lances, which they throw to a great distance with surprising dexterity. Their manner of catching whales is quite different from that practised by the Europeans. About 50 persons, men and women, set out in one long boat, which is called a *kone-boat*, from *kone* a "woman," because it is rowed by females only. When they find a whale, they strike him with harpoons, to which are fastened with long lines some seals skins blown up like bladders. These, by floating on the surface, not only discover the back of the whale, but hinder him from diving under water for any length of time. They continue to pursue him until he loses strength, when they pierce him with spears and lances till he expires. On this occasion they are clad in their spring coats consisting of one piece, with gloves, boots, caps made of seal-skin so closely laced and sewed that they keep out water. Thus accoutred, they leap into the sea; and begin to slice off the fat, even under water, before the whale is dead.—They have many different ways of killing seals; namely, by striking them with a small harpoon equipped also with an air-bag; by watching them when they come to breathe at the air-holes in the ice, and striking them with spears; by approaching them in the disguise of their own species, that is, covered with a seal-skin, creeping upon the ice, and moving the head from side to side as the seals are accustomed to do. By this stratagem the Greenlander moves towards the unsuspecting

Greenland.

Greenland. pecking seal, and kills him with a spear. The Greenlanders angle with lines made of whale-bone cut very small, by means of which they succeed wonderfully. The Greenland canoe, like that used in Nova Zembla and Hudson's bay, is about three fathoms in length, pointed at both ends, and three quarters of a yard in breadth. It is composed of thin rafts fastened together with the sinews of animals. It is covered with dressed seal-skins both below and above, in such a manner that only a circular hole is left in the middle, large enough to admit the body of one man. Into this the Greenlander thrusts himself up to the waist, and fastens the skin so tight about him that no water can enter. Thus secured, and armed with a paddle broad at both ends, he will venture out to sea in the most stormy weather to catch seals and sea-fowl; and if he is overset, he can easily raise himself by means of his paddle. A Greenlander in one of these canoes, which was brought with him to Copenhagen, outstripped a pinnacle of 16 oars, manned with choice mariners.—The kone-boat is made of the same materials, but more durable; and so large, that it will contain 50 persons with all their tackle, baggage, and provisions. She is fitted with a mast, which carries a triangular sail made of the membranes and entrails of seals, and is managed without the help of braces and bowlings. These kones are flat-bottomed, and sometimes 60 feet in length. The men think it beneath them to take charge of them; and therefore they are left to the conduct of the women, who indeed are obliged to do all the drudgery, including even the building and repairing their houses, while the men employ themselves wholly in preparing their hunting implements and fishing tackle.

This country is but thinly inhabited. In the winter time the people dwell in huts built of stone or turf: on the one side are the windows, covered with the skins of seals or rein-deer. Several families live in one of these houses, possessing each a separate apartment, before which is a hearth with a great lamp placed on a trevit, over which hangs their kettle: above is a rack or shelf on which their wet clothes are dried. They burn train-oil in their lamps; and instead of wick, they use a kind of moss, which fully answers the purpose. These fires are not only sufficient to boil their victuals; but likewise produce such a heat, that the whole house is like a bagnio. The door is very low, that as little cold air as possible may be admitted. The house within is lined with old skins, and surrounded with benches for the convenience of strangers. In the summer-time they dwell in tents made of long poles fixed in a conical form, covered in the inside with deers skins, and on the outside with seals skins, dressed so that the rain cannot pierce them.

10
East Green-
land.

East Greenland was for a long time considered as a part of the continent of West Greenland, but is now discovered to be an assemblage of islands lying between $76^{\circ} 46'$ and $80^{\circ} 30'$ of north latitude, and between 9° and 20° of east longitude. It was discovered by Sir Hugh Willoughby in the 1553, who called it *Groenland*; supposing it to be a part of the western continent. In 1595, it was again visited by William Barentz and John Cornelius, two Dutchmen, who pre-

tended to be the original discoverers, and called the country *Spitzbergen*, or Sharp Mountains, from the many sharp-pointed and rocky mountains with which it abounds. They alleged that the coast discovered by Sir Hugh Willoughby was some other country; which accordingly the Hollanders delineated on their maps and charts by the name of *Willoughby Land*; whereas in fact no such land ever existed; and long before the voyage of these Dutchmen, Stephen Barrows, an English shipmaster, had coasted along a desolate country from N. Lat. 78° to $80^{\circ} 11'$, which was undoubtedly Spitzbergen. The sea in the neighbourhood of the islands of Spitzbergen abounds very much with whales, and is the common resort of the whale-fishing ships from different countries, and the country itself is frequently visited by these ships; but till the late voyage of the Hon. Capt. Phipps, by order of his Majesty, the situation of it was erroneously laid down. It was imagined that the land stretched to the northward as far as 82° of north latitude; but Capt. Phipps found the most northerly point of land, called *Seven Islands*, not to exceed $80^{\circ} 30'$ of latitude. Towards the east he saw other lands lying at a distance, so that Spitzbergen plainly appeared to be surrounded by water on that side, and not joined to the continent of Asia, as former navigators had supposed. The north and west coasts also he explored, but was prevented by the ice from sailing so far to the northward as he wished. The coast appeared neither habitable nor accessible. It is formed of high, barren, black rocks, without the least marks of vegetation; in many places bare and pointed; in others covered with snow, appearing even above the clouds. The valleys between the high cliffs were filled with snow and ice. "This prospect," says Capt. Phipps, "would have suggested the idea of perpetual winter, had not the mildness of the weather, the smooth water, bright sun-shine, and constant day-light, given a cheerfulness and novelty to the whole of this romantic scene." The current ran along this coast half a knot an hour, north. The height of one mountain seen here was found by geometrical mensuration to be at one time $1503\frac{1}{2}$ feet, at another $1503\frac{8}{10}$ feet. By a barometer constructed after De Luc's method, the height was found to be $1588\frac{1}{2}$ feet. On this occasion Capt. Phipps has the following remarks. "I cannot account for the great difference between the geometrical measure and the barometrical according to M. de Luc's calculation, which amounts to 84.7 feet. I have no reason to doubt the accuracy of Dr Irving's observations, which were made with great care. As to the geometrical measure, the agreement of so many triangles, each of which must have discovered even the smallest error, is the most satisfactory proof of its correctness. Since my return I have tried both the theodolite and barometer, to discover whether there was any fault in either; and find them, upon trial, as I had always done before, very accurate."

There is good anchorage in Schmeerenburgh harbour, lying in N. Lat. $74^{\circ} 44'$ E. Long. $9^{\circ} 50' 45''$, in 13 fathom, sandy bottom, not far from the shore, and well sheltered from all winds. Close to this harbour is an island called *Amsterdam Island*, where the Dutch used formerly to boil their whale-oil; and the remains of some convenience erected by them for that purpose

Greenland. purpose are still visible. The Dutch ships still resort to this place for the latter season of the whale-fishery. —The stone about this place is chiefly a kind of marble, which dissolves easily in the marine acid. There were no appearances of minerals of any kind, nor any signs of ancient or modern volcanoes. No insects, or any species of reptiles, were seen, not even the common earth-worm. There were no springs or rivers; but great plenty of water was produced from the snow which melted on the mountains.

The most remarkable views which these dreary regions present are those called *Icebergs*. They are large bodies of ice filling the valleys between the high mountains. Their face towards the sea is nearly perpendicular, and of a very lively light-green colour. One was about 300 feet high, with a cascade of water issuing from it. The black mountains on each side, the white snow, and greenish coloured ice, composed a very beautiful and romantic picture. Large pieces frequently broke off from the icebergs, and fell with great noise into the water. One piece was observed to have floated out into the bay, and grounded in 24 fathoms; it was 50 feet high above the surface of the water, and of the same beautiful colour with the iceberg from which it had separated.

These islands are totally uninhabited, though it doth not appear but that human creatures could subsist on them, notwithstanding their vicinity to the pole. Eight English sailors, who were accidentally left here by a whale-fishing ship, survived the winter, and were brought home next season. The Dutch then attempted to settle a colony on Amsterdam island above-mentioned; but all the people perished, not through the severity of the climate, but of the scurvy, owing to the want of those remedies which are now happily discovered, and which are found to be so effectual in preventing and curing that dreadful disease.—The late account also of six Russian sailors who staid four years in this inhospitable country, affords a decisive proof, that a colony might be settled on East Greenland, provided the doing so could answer any good purpose.

GREENLAND Company. A joint stock of 40,000 l. was by statute to be raised by subscribers, who were incorporated for 14 years from the first of October 1693, and the company to use the trade of catching whales, &c. into and from Greenland, and the Greenland seas; they may make bye-laws for the government of the persons employed in their ships, &c. Stat. 4 and 5 W. III. cap. 17. This company was farther encouraged by parliament in 1696; but partly by unskilful management, and partly by real losses, it was under a necessity of entirely breaking up, before the expiration of the term assigned to it, ending in 1707. But any person who will adventure to Greenland for whale-fishing, shall have all privileges granted to the Greenland company, by 1 Anne, cap. 16. and thus the trade was again laid open. Any subjects may import whale-fins, oil, &c. of fish caught in the Greenland seas, without paying any customs, &c. stat. 10 Geo. I. cap. 16. And ships employed in the Greenland-fishery are to be of such burden, provided with boats, so many men, fishing-lines, harping irons, &c. and be licensed to proceed; and on their return shall be paid 20s. per ton bounty, for whale-fins, &c. imported; 6 Geo. II. cap. 33. The bounty was afterwards increased; but has been lately diminished, and

since this diminution the trade has increased. See *Greenock, Greenwich.*

GREENOCK, a sea-port town of Scotland, and one of the ports of the city of Glasgow. It is distant 22 miles from that city; and was formerly called the *Bay of St Laurence*. The Frith of Clyde here expands into a fine basin four miles wide, and is landlocked on all sides. Greenock is a burgh of barony, and the best built town on all the coast. It is the chief resort of the herring fishery, and otherwise a place of great trade and very populous.—The harbour was made by Sir John Shaw of Greenock, whose ancestor built the church; and the family had here a castle.

GREENWICH, a town of the county of Kent, in England, pleasantly situated on the bank of the Thames, about five miles east from London. Here was formerly a royal palace, built by Humphry duke of Gloucester, enlarged by Henry VII. and completed by Henry VIII. The latter often chose this town for his place of residence; as did also the queens Mary and Elizabeth, who were born in it. The same duke Humphry began a tower on the top of the steep hill in the park, which was finished by Henry VII. but afterwards demolished, and a royal observatory erected in its place by Charles II. furnished with mathematical instruments for astronomical observations, and a deep dry well for observing the stars in the day-time. The palace being afterwards much neglected, king Charles II. (who had enlarged the park, walled it about and planted it), pulled it down, and began another, of which he lived to see the first wing magnificently finished. But king William III. in 1694, granted it, with nine acres of ground thereto belonging, to be converted into a royal hospital for old and disabled seamen, the widows and children of those who lost their lives in the service, and for the encouragement of navigation. The wing, which cost king Charles 36,000 l. is now the first wing of the hospital towards London. The front to the Thames consists of two ranges of stone buildings, with the ranger's house in the centre of the area, but detached from any part of the hospital. These buildings perfectly correspond with each other, and have their tops crowned with a stone ballustrade. The buildings which are facing the area, correspond with them, though in a finer and more elegant style; and have domes at their ends, which are 120 feet high, supported on coupled columns. Under one of these is the hall, which is finely painted by Sir James Thornhill, and contains many royal portraits; and under the other the chapel, which by accident was destroyed by fire. This fire broke out in the hospital on the second of January 1779, and totally consumed the dome at the S. E. quarter of the building, with the chapel which was the most elegant in the world, the great dining-hall, and eight wards containing the lodgings of near 600 pensioners. The dome was rebuilt about the year 1785; but the reparation of the whole damage is not yet completed. On the sides of the gate which opens to these buildings from the park, are placed a large terrestrial and celestial globe, in which the stars are gilt; and in the centre of the area is a statue of George II. About 2000 old disabled seamen are maintained in this hospital. Besides private benefactions, to the amount of near L. 60,000 (which appear in tables hung up at the entrance of the hall), the parliament, in the year

Greenwich. 1732, settled upon it the earl of Derwentwater's estate, to the value of L. 6000 *per annum*. All strangers who see it, pay twopence each; and this income is applied to the support of the mathematical school for the sons of sailors. For the better support of which, every seaman in the royal navy, and in the merchant service, pays sixpence a month, stopped out of their pay, and delivered in at the six-penny receiver's office in Tower-hill. On this account, a seaman, who can produce an authentic certificate of his being disabled, and rendered unfit for service, by defending any ship belonging to his Majesty's British subjects, or in taking any ship from the enemy, may be admitted into this hospital, and receive the same benefit from it as if he had been in his Majesty's immediate service. Besides the seamen and widows above-mentioned, about 100 boys, the sons of seamen, are bred up for the service of the royal navy; but there are no out-pensioners as at Chelsea. Each of the mariners has a weekly allowance of seven loaves, weighing 16 ounces each; three pounds of beef, two of mutton, a pint of pease, a pound and a quarter of cheese, two ounces of butter, fourteen quarts of beer, and one shilling a-week tobacco-money: the tobacco-money of the boatswains is two shillings and sixpence a-week each, that of their mates one shilling and sixpence, and that of the other officers in proportion to their rank: besides which, each common pensioner receives once in two years, a suit of blue cloaths, a hat, three pair of stockings, two pair of shoes, five neck-cloths, three shirts, and two night-caps. Out of all that is given for showing the hall, only three-pence in the shilling is allowed to the person that shows them; the rest makes an excellent fund for the yearly maintenance of not less than 20 poor boys, who are the sons of mariners that have been either slain or disabled in the service of their country. The park is well stocked with deer, and affords as much variety, in proportion to its size, as any in the kingdom; but the views from the Observatory and the One-tree hill are beautiful beyond imagination, particularly the former. The projection of these hills is so bold, that you do not look down upon a gradually falling slope or flat inclosures, but at once upon the tops of branching trees, which grow in knots and clumps out of deep hollows and im-browned dells. The cattle which feed on the lawns, which appear in breaks among them, seem moving in a region of fairy land. A thousand natural openings among the branches of the trees break upon little picturesque views of the swelling turf, which, when illumined by the sun, have an effect pleasing beyond the power of fancy to paint. This is the foreground of the landscape: a little farther, the eye falls on that noble structure the hospital, in the midst of an amphitheatre of wood; then the two reaches of the river make that beautiful serpentine which forms the Isle of Dogs, and present the floating millions of the Thames. To the left appears a fine tract of country, leading to the capital, which there finishes the prospect. The parish-church of Greenwich, rebuilt by the commissioners for erecting the 50 new churches, is a very handsome structure, dedicated to St Alphage, archbishop of Canterbury, who is said to have been slain by the Danes in the year 1012 on the spot where the church now stands. There is a college at the end of the town, fronting the Thames, for the maintenance of 20 decayed old house-keepers, 12 out of Greenwich, and

eight who are to be alternately chosen from Snottisham and Castle-Rising in Norfolk. This is called *the duke of Norfolk's College*, though it was founded and endowed in 1613 by Henry earl of Northampton the duke of Norfolk's brother, and by him committed to the care of the Mercers company. To this college belongs a chapel, in which the earl's body is laid; which, as well as his monument, was removed hither a few years ago from the chapel of Dover castle. The pensioners, besides meat, drink, and lodging, are allowed one shilling and sixpence a week, with a gown every year, linen once in two years, and hats once in four years. In 1560, Mr Lambard, author of the *Perambulation of Kent*, also built an hospital, called queen Elizabeth's college, said to be the first erected by an English Protestant. There are likewise two charity-schools in this parish. The river Thames is here very broad, and the channel deep; and at some very high tides the water is salt. This is the chief harbour for the king's yachts. The town contains about 1500 houses; and a market on Wednesday and Saturday was erected here in 1737; the direction of which is in the governors of the royal hospital, to which the profits arising from it were to be appropriated.

GREGARIOUS, among zoologists, a term applied to such animals as do not live solitary, but associate in herds or flocks.

GREGORIAN CALENDAR, that which shows the new and full moon, with the time of Easter, and the moveable feasts depending thereon, by means of epacts disposed through the several months of the Gregorian year. See CHRONOLOGY, n^o 24.

GREGORIAN Telescope. See OPTICS, (Index.)

GREGORIAN Year. See CHRONOLOGY, n^o 24.

GREGORY the Great, was born at Rome, of a patrician family. He discovered such abilities in the exercise of the senatorial employments, that the emperor Justin the younger appointed him prefect of Rome. Pope Pelagius II. sent him nuncio to Constantinople, to demand succours against the Lombards. When he thought of enjoying a solitary life, he was elected pope by the clergy, the senate, and the people of Rome. Besides his learning and diligence in instructing the church, both by writing and preaching, he had a very happy talent in winning over princes in favour of the temporal as well as spiritual interest of religion. He undertook the conversion of the English, and sent over some monks of his order, under the direction of Augustine their abbot. His morality with respect to the chastity of churchmen was very rigid, asserting that a man who had ever known a woman ought not to be admitted to the priesthood; and he always caused the candidates for it to be examined upon that point. He likewise vigorously exerted himself against such as were found guilty of calumny. However, he flattered the emperor Phocas, while his hands were yet reeking with the blood of Mauritius, and of his three children, who had been butchered in his fight. He likewise flattered Brunehaut, a very wicked queen of France. He is accused of destroying the noble monuments of ancient Roman magnificence, that those who visited the city might not attend more to the triumphal arches than to holy things; and burnt a multitude of heathen books, Livy in particular. He died in 604.

GREGORY of Nazianzen, surnamed the *Divine*, was one

Gregorius
||
Gregory.

Gregory. one of the most illustrious ornaments of the Greek church in the fourth age. He was made bishop of Constantinople in 379; but finding his election contested by Timotheus archbishop of Alexandria, he voluntarily resigned his dignity about 382, in the general council of Constantinople. His works are extant, in two volumes, printed at Paris in 1609. His style is said to be equal to that of the most celebrated orators of ancient Greece.

GREGORY (Theodorus), surnamed *Thaumaturgus* on account of his miracles, was the scholar of Origen; and was elected bishop of Neocæsarea, the place of his birth, about the year 240, during his absence. He assisted at the council of Antioch, in 255, against Paulus Samosetanus; and died in 270. He had the satisfaction of leaving only seventeen idolaters in his diocese, where there were but seventeen Christians when he was ordained. There is still extant of his, A gratulatory oration to Origen, A canonical epistle, and some other works.

GREGORY, bishop of Nyssa, one of the fathers of the church, and author of the Nicene creed, was born in Cappadocia, about the year 331. He was chosen bishop of Nyssa in 372, and banished by the emperor Valens for adhering to the council of Nice. He was nevertheless afterwards employed by the bishops in several important affairs, and died in 396. He wrote, Commentaries on the Scriptures; Sermons on the mysteries; Moral discourses; Dogmatical treatises; Panegyrics on the saints; some letters on church-discipline; and other works. His style is very allegorical and affected.

GREGORY of Tours, or *Georgius Florentius Gregorius*, one of the most illustrious bishops and celebrated writers of the sixth century, was descended from a noble family in Auvergne. He was educated by his uncle Gallus, bishop of Clermont; and distinguished himself so much by his learning and virtue, that in 573 he was chosen bishop of Tours. He afterwards went to Rome to visit the tomb of the apostles, where he contracted a friendship with Gregory the Great, and died in 595. This author was extremely credulous with regard to miracles. He wrote, 1. The history of France. 2. The lives of the saints; and other works. The best edition is that published by Father Rumart, 1699.

From Memoirs of the Gregories, prefixed to the new edition of the Works of Dr James Gregory, in 4 vols.

GREGORY (James), one of the most eminent mathematicians of the last century, was a son of the Rev. Mr John Gregory minister of Drumoak in the county of Aberdeen, and was born at Aberdeen in 1638. His mother was a daughter of Mr David Anderson of Finzaugh, a gentleman who possessed a singular turn for mathematical and mechanical knowledge. This mathematical genius was hereditary in the family of the Andersons, and from them seems to have been transmitted to their descendants of the name of Gregory. Alexander Anderson, cousin german of the above-mentioned David, was professor of mathematics at Paris in the beginning of the 17th century, and published there in 1612, *Supplementum Apollonii redivivi*, &c. The mother of James Gregory inherited the genius of her family; and observing in her son, while yet a child, a strong propensity to mathematics, she instructed him herself in the elements of that science. He received his education in the languages at the

grammar school of Aberdeen, and went through the usual course of academical studies in the Marischal college.

At the age of 24 he published his treatise, intitled *Optica Promota, seu abditæ radiorum reflexorum et refractorum mysteria, geometrice enucleata; cui subnectitur appendix subtilissimorum astronomiæ problematum resolutionem exhibens*, London 1663: a work of great genius, in which he gave the world an invention of his own, and one of the most valuable of the modern discoveries, the construction of the reflecting telescope. This discovery immediately attracted the attention of the mathematicians, both of our own and of foreign countries, who were soon convinced of its great importance to the sciences of optics and astronomy. The manner of placing the two specula upon the same axis appearing to Sir Isaac Newton to be attended with the disadvantage of losing the central rays of the larger speculum, he proposed an improvement on the instrument, by giving an oblique position to the smaller speculum, and placing the eye-glass in the side of the tube. But it is worth remarking, that the Newtonian construction of that instrument was long abandoned for the original or Gregorian, which is at this day universally employed where the instrument is of a moderate size; though Mr Herschel has preferred the Newtonian form for the construction of those immense telescopes, which of late years he has so successfully employed in observing the heavens.

The university of Padua being at that time in high reputation for mathematical studies, James Gregory went thither soon after the publication of his first work; and fixing his residence there for some years, he published, in 1667, *Vera Circuli et Hyperbolæ quadratura*; in which he propounded another discovery of his own, the invention of an infinitely converging series for the areas of the circle and hyperbole. To this treatise, when republished in 1668, he added a new work, intitled, *Geometriæ pars universalis, inserviens quantitatum curvarum transmutationi et mensuræ*; in which he is allowed to have shown, for the first time, a method for the transmutation of curves. These works engaged the notice, and procured Mr Gregory the correspondence, of the greatest mathematicians of the age, Newton, Huygens, Halley, and Wallis; and their author being soon after chosen a fellow of the royal society of London, contributed to enrich the Philosophical Transactions at that time by many excellent papers. Through this channel, in particular, he carried on a dispute with Mr Huygens, upon the occasion of his treatise on the quadrature of the circle and hyperbole, to which that able mathematician had started some objections. Of this controversy, it is unnecessary to enter into particulars. It is sufficient to say, that, in the opinion of Leibnitz, who allows Mr Gregory the highest merit for his genius and discoveries, Mr Huygens has pointed out, though not errors, some considerable deficiencies in the treatise above mentioned, and shown a much simpler method of attaining the end in view.

In 1668, Mr James Gregory published at London another work, intitled, *Exercitationes Geometricæ*, which contributed still to extend his reputation. About this time he was elected professor of mathematics in the university of St Andrew's; an office which he held for

Gregory. six years. During his residence there, he married, in 1669, Mary, the daughter of George Jameson the celebrated painter, whom Mr Walpole has termed the Vandyke of Scotland, and who was fellow-disciple with that great artist in the school of Rubens at Antwerp.

In 1674, he was called to Edinburgh, to fill the chair of mathematics in that university. This place he had held for little more than a year, when, in October 1675, being employed in showing the satellites of Jupiter through a telescope to some of his pupils, he was suddenly struck with total blindness, and died a few days after, at the early age of 37.

He was a man of an acute and penetrating genius. His temper seems to have been warm, as appears from the conduct of his dispute with Mr Huygens; and, conscious perhaps of his own merits as a discoverer, he seems to have been jealous of losing any portion of his reputation by the improvements of others upon his inventions.

Gregory (David), Savilian professor of astronomy at Oxford, whom Dr Smith has termed *subtilissimi ingenii mathematicus*, was the eldest son of Mr Gregory of Kinnairdy, brother of the above mentioned Mr James Gregory. He was born at Aberdeen in 1661, and received the earlier parts of his education in that city. He completed his studies at Edinburgh; and, being possessed of the mathematical papers of his uncle, soon distinguished himself likewise as the heir of his genius. In the 23d year of his age, he was elected professor of mathematics in the university of Edinburgh; and published, in the same year, *Exercitatio Geometrica de dimensione figurarum, sive specimen methodi generalis dimetendi quasvis figuras*, Edinburgh, 1684, 4to. He saw very early the excellence of the Newtonian philosophy; and had the merit of being the first who introduced it into the schools by his public lectures at Edinburgh. "He had (says Mr Whiston *) already caused several of his scholars to keep acts, as we call them, upon several branches of the Newtonian philosophy; while we at Cambridge, poor wretches, were ignominiously studying the fictitious hypotheses of the Cartesian."

* *Memoirs of his own Life*; l. 32.

In 1691, on the report of Dr Bernard's intention of resigning the Savilian professorship of astronomy at Oxford, David Gregory went to London; and being patronised by Sir Isaac Newton, and warmly befriended by Mr Flamsteed the astronomer royal, he obtained the vacant professorship, for which Dr Halley was a competitor. This rivalry, however, instead of animosity, laid the foundation of friendship between these eminent men; and Halley soon after became the colleague of Gregory, by obtaining the professorship of geometry in the same university. Soon after his arrival in London, Mr Gregory had been elected a fellow of the royal society; and, previously to his election in-

to the Savilian professorship, had the degree of doctor of physic conferred on him by the university of Oxford (A).

Gregory.

In 1693, he published in the Philosophical Transactions a resolution of the Florentine problem *de Testudine veliformi quadribili*; and he continued to communicate to the public, from time to time, many ingenious mathematical papers by the same channel. In 1695, he printed at Oxford *Catoptrica et Dioptrica Sphærica Elementa*; a work which, as he informs us in his preface, contains the substance of some of his public lectures read, eleven years before, at Edinburgh. This valuable treatise was republished first with additions by Dr William Brown, with the recommendation of Mr Jones and Dr Defaguliers; and afterwards by the latter of these gentlemen, with an appendix containing an account of the Gregorian and Newtonian telescopes, together with Mr Hadley's tables for the construction of both those instruments. It is not unworthy of remark, that, in the end of this treatise, there is an observation which shows, that what is generally believed to be a discovery of a much later date, the construction of achromatic telescopes, which has been carried to great perfection by Mr Dollond and Mr Ramsden, had suggested itself to the mind of David Gregory, from the reflection on the admirable contrivance of nature in combining the different humours of the eye. The passage is as follows: "Quod si ob difficultates physicas in speculis idoneis torno elaborandis et poliendis, etiamnum lentibus uti oporteat, fortassis media diversæ densitatis ad lentem objectivam componendam adhibere utile foret, ut a natura factum observamus in oculi fabrica, ubi cristallinus humor (fere ejusdem cum vitro virtutis ad radios lucis refringendos) aqueo et vitreo (aquæ quoad refractionem haud absimilibus) conjungitur, ad imaginem quam distincte fieri poterit, a natura nihil frustra moliente, in oculi fundo depingendam." *Catopt. et Dioptr. Sphæra. Elem. Oxon.* 1695, p. 98.

In 1702 our author published at Oxford, *Astronomiæ Physicæ et Geometricæ Elementa*; a work which is accounted his master-piece. It is founded on the Newtonian doctrines, and was esteemed by Sir Isaac Newton himself as a most excellent explanation and defence of his philosophy. In the following year he gave to the world an edition in folio of the works of Euclid in Greek and Latin; in prosecution of a design of his predecessor Dr Bernard, of printing the works of all the ancient mathematicians. In this work, although it contains all the treatises attributed to Euclid, Dr Gregory has been careful to point out such as he found reason, from internal evidence, to believe to be the productions of some inferior geometri-
cian. In prosecution of Dr Bernard's plan, Dr Gregory engaged, soon after, with his colleague Halley,
in

(A) On obtaining the above professorship, he was succeeded in the mathematical chair at Edinburgh by his brother James, likewise an eminent mathematician; who held that office for thirty-three years, and retiring in 1725 was succeeded by the celebrated Maclaurin. A daughter of this professor James Gregory, a young lady of great beauty and accomplishments, was the victim of an unfortunate attachment, which furnished the subject of Mallet's well-known ballad of *William and Margaret*.

Another brother, *Charles*, was created professor of mathematics at St Andrew's by queen Anne in 1707. This office he held with reputation and ability for thirty-two years; and, resigning in 1739, was succeeded by his son, who eminently inherited the talents of his family, and died in 1763.

Gregory. in the publication of the Conics of Apollonius; but he had proceeded but a little way in this undertaking when he died, in the 49th year of his age, at Maidenhead in Berkshire, A. D. 1710. To the genius and abilities of David Gregory, the most celebrated mathematicians of the age, Sir Isaac Newton, Dr Halley, and Dr Keill, have given ample testimonies. Besides those works published in his lifetime, he left in manuscript, *A Short Treatise of the Nature and Arithmetic of Logarithms*, which is printed at the end of Dr Keill's translation of Commandine's Euclid; and a *Treatise of Practical Geometry*, which was afterwards translated, and published in 1745, by Mr Maclaurin.

Dr David Gregory married, in 1695, Elisabeth, the daughter of Mr Oliphant of Langtown in Scotland. By this lady he had four sons, of whom, the eldest, David, was appointed regius professor of modern history at Oxford by king George I. and died in 1767, in an advanced age, after enjoying for many years the dignity of dean of Christ church in that university.

GREGORY (Dr John), professor of medicine in the university of Edinburgh, was the son of Dr James Gregory professor of medicine in King's college Aberdeen, and grandson of James the inventor of the Gregorian telescope. His father was first married to Catharine Forbes, daughter of Sir John Forbes of Monymusk; by whom he had six children, most of whom died in infancy. He married afterwards Anne Chalmers, only daughter of the Rev. Mr George Chalmers principal of King's college, by whom he had two sons and a daughter. John, the youngest of the three, was born at Aberdeen, June 3. 1724. Losing his father when only in the 7th year of his age, the care of his education devolved on his grandfather Principal Chalmers, and on his elder brother Dr James Gregory, who, upon the resignation of their father a short time before his death, had been appointed to succeed him in the professorship of medicine in King's college. He likewise owed much in his infant years, and during the whole course of his studies, to the care and attention of his cousin, the celebrated Dr Reid, now of the university of Glasgow. The rudiments of our author's classical education he received at the grammar-school of Aberdeen; and, under the eye of his grandfather, he completed, in King's college, his studies in the Latin and Greek languages, and in the sciences of ethics, mathematics, and natural philosophy. His master in philosophy and in mathematics was Mr Thomas Gordon, the present philosophy professor of King's college, who has ably filled an academical chair for above half a century.

In 1742, Mr Gregory went to Edinburgh, where the school of medicine was then rising to that celebrity which has since so remarkably distinguished it. Here he attended the anatomical lectures of the elder Dr Monro, of Dr Sinclair on the theory of medicine, and of Dr Rutherford on the practice. He heard likewise the prelections of Dr Alston on the materia medica and botany, and of Dr Plummer on chemistry. The medical society of Edinburgh, instituted for the free discussion of all questions relative to medicine and philosophy had begun to meet in 1737. Of this society we find Mr Gregory a member in 1742, at the time when Dr Mark Akenfide, his fellow student, and

intimate companion, was a member of the same institution. Gregory.

In the year 1745 our author went to Leyden, and attended the lectures of those celebrated professors Gaubius, Albinus, and Van Royen. While at this place he had the honour of receiving from the King's college of Aberdeen, his *alma mater*, who regarded him as a favourite son, an unsolicited degree of doctor of medicine; and soon after, on his return thither from Holland, he was elected professor of philosophy in the same university. In this capacity he read lectures during the years 1747, 1748, and 1749, on mathematics, on experimental philosophy, and on moral philosophy. In the end of 1749, however, he chose to resign his professorship of philosophy, his views being turned chiefly to the practice of physic, with which he apprehended the duties of this professorship, occupying a great portion of his time, too much interfered. Previously, however, to his settling as a physician at Aberdeen, he went for a few months to the Continent; a tour of which the chief motive was probably amusement, though, to a mind like his, certainly not without its profit in the enlargement of ideas, and an increased knowledge of mankind.

Some time after his return to Scotland, Dr Gregory married, in 1752, Elisabeth daughter of William Lord Forbes; a young lady who, to the exterior endowments of great beauty and engaging manners, joined a very superior understanding, and an uncommon share of wit. With her he received a handsome addition of fortune; and during the whole period of their union, which was but for the space of nine years, enjoyed the highest portion of domestic happiness. Of her character it is enough to say, that her husband, in that admired little work, *A Father's Legacy to his daughters*, the last proof of his affection for them, declares, that, "while he endeavours to point out what they should be, he draws but a very faint and imperfect picture of what their mother was." The field of medical practice at Aberdeen being at that time in a great measure pre-occupied by his elder brother Dr James Gregory, and others of some note in their profession, our author determined to try his fortune in London. Thither accordingly he went in 1754; and being already known by reputation as a man of genius, he found an easy introduction to many persons of distinction both in the literary and polite world. The late George Lord Lyttleton was his friend and patron. An attachment, which was founded on a striking similarity of manners, of tastes, and of dispositions, grew up into a firm and permanent friendship; and to that nobleman, to whom Dr Gregory was wont to communicate all his literary productions, the world is indebted for the publication of the *Comparative View of the State and Faculties of Man*, which made him first known as an author. Dr Gregory likewise enjoyed the friendship of the late Edward Montague, Esq; and of his lady, the celebrated champion of the Fame of Shakespeare against the cavils and calumnies of Voltaire. At her assemblies, or *conversazione*, the resort of taste and genius, our author had an opportunity of cultivating an acquaintance with many of the most distinguished literary characters of the present times.

In 1754 Dr Gregory was chosen fellow of the royal

Gregory.

al society of London; and, daily advancing in the public esteem, it is not to be doubted, that, had he continued his residence in that metropolis, his professional talents would have found their reward in a very extensive practice. But the death of his brother, Dr James Gregory, in November 1755, occasioning a vacancy in the professorship of physic in King's college, Aberdeen, which he was solicited to fill, he returned to his native country in the beginning of the following year, and took upon him the duties of that office to which he had been elected in his absence.

Here our author remained till the end of the year 1764, when, urged by a very laudable ambition, and presuming on the reputation he had acquired as affording a reasonable prospect of success in a more extended field of practice, he changed his place of residence for Edinburgh. His friends in that metropolis had represented to him the situation of the college of medicine as favourable to his views of filling a professorial chair in that university; which accordingly he obtained in 1766, on the resignation of Dr Rutherford professor of the practice of physic. In the same year he had the honour of being appointed first physician to his majesty for Scotland on the death of Dr Whytt.

On his first establishment in the university of Edinburgh, Dr Gregory gave lectures on the practice of physic during the years 1767, 1768, and 1769. Afterwards, by agreement with Dr Cullen, professor of the theory of physic, these two eminent men gave alternate courses of the theory and of the practice.—As a public speaker, Dr Gregory's manner was simple, natural, and animated. Without the graces of oratory, which the subject he had to treat in a great degree precluded, he expressed his ideas with uncommon perspicuity, and in a style happily attuned between the formality of studied composition and the ease of conversation. It was his custom to premeditate, for a short time before entering the college, the subject of his lecture, consulting those authors to whom he had occasion to refer, and marking in short notes the arrangement of his intended discourse: then fully master of his subject, and confident of his own powers, he trusted to his natural facility of expression to convey those opinions which he had maturely deliberated. The only lectures which he committed fully to writing, were those introductory discourses which he read at the beginning of his annual course, and which are published in these volumes under the title of *Lectures on the Duties and Qualifications of a Physician*. Of these, which were written with no view to publication, many copies were taken by his pupils, and some from the original manuscript, which he freely lent for their perusal. On hearing that a copy had been offered for sale to a bookseller, it became necessary to anticipate a fraudulent, and perhaps a mutilated publication, by authorising an impression from a corrected copy, of which he gave the profits to a favourite pupil. These lectures were first published in 1770, and afterwards in an enlarged and more perfect form in 1772.

In the same year, 1772, Dr Gregory published *Elements of the Practice of Physic, for the use of Students*; a work intended solely for his own pupils, and to be used by himself as a text-book to be commented upon in his course of lectures. In an advertisement prefixed

to this work, he signified his intention of comprehending in it the whole series of diseases of which he treated in his lectures on the Practice of Physic; but this intention he did not live to accomplish, having brought down the work no further than to the end of the class of Febrile Diseases.—In his academical lectures, Dr Gregory never attempted to mislead the student by flattering views of the perfection of the science; but was, on the contrary, anxious to point out its defects; wisely judging, that a thorough sense of the imperfection of an art or science is the first step towards its improvement. In this view he was careful to expose the fallaciousness of the several theories and hypotheses which have had the most extensive currency, and perpetually inculcated the danger of systematizing with limited experience, or an imperfect knowledge of facts. Yet in the work last mentioned it will appear, from the order in which he has treated of the several diseases, that he did not entirely neglect the systematic arrangements of other authors. These, however, he warned his pupils, that he had not adopted from any conviction of the rectitude of those theories to which they referred, but only as affording that degree of method, and regularity of plan, which is found to be the best help to the study of any science. Considering a rational theory of physic to be as yet a desideratum, it was his object to communicate to his pupils the greatest portion of practical knowledge, as the only basis on which such a theory could ever be reared. His method, in treating of the several diseases, was first to mention those symptoms which are understood among physicians to characterise or define a disease; proceeding from the general to the more particular series of symptoms and their occasional varieties; to point out accurately the *diagnostic* symptoms, or those by which one disease is essentially distinguished from others that resemble it, and to mark likewise the *prognostics* by which a physician is enabled to conjecture of the probable event of a disease, whether favourable or otherwise. He then proceeded to specify the various causes, predisposing, occasional, and proximate; accounting, as far as he thought could be done on just principles, for the appearance of the several symptoms; and, finally, he pointed out the general plan of cure, the particular remedies to be employed, and the cautions requisite in the administration of them. Thus desirous of establishing the science of medicine upon the solid foundation of practice and experience; and knowing that many things asserted as facts by medical writers have been assumed on a very careless observation, while confirming a favourite theory; and that, on the other hand, many real and important facts have, from the same spirit of system, been explained away and discredited; he constantly endeavoured, both by his precept and example, to inculcate to his pupils the necessity of extreme caution either in admitting or in denying medical facts, or what are commonly given as such. To the desire of enforcing this necessary caution is owing that multitude of queries respecting matters of fact, as well as matters of opinion, which occurs in the *Elements of the Practice of Physic*.

Dr Gregory, soon after the death of his wife, and, as he himself says, "for the amusement of his solitary hours,"

Gregory.

Gregory. hours," employed himself in the composition of that admirable tract, intitled, *A Father's Legacy to his Daughters*; a work which, though certainly never intended by its author for the public eye, it would have been an unwarrantable diminution of his fame, and a capricious refusal of a general benefit to mankind, to have limited to the sole purpose for which it was originally designed. It was, therefore, with great propriety, published after the author's death by his eldest son. This work is a most amiable display of the piety and goodness of his heart, and his consummate knowledge of human nature and of the world. It manifests such solicitude for their welfare, as strongly recommends the advice which he gives. He speaks of the female sex in the most honourable terms, and labours to increase its estimation, whilst he plainly, yet genteelly and tenderly, points out the errors into which young ladies are prone to fall. It is particularly observable, in what high and honourable terms he speaks of the Holy Scriptures, of Christian worship, and faithful ministers; how warmly he recommends to his daughters the serious and devout worship of God in public and private. He dwells largely on that temper and behaviour, which were particularly suited to their education, rank, and circumstances; and recommends that gentleness, benevolence, and modesty, which adorn the character of the ladies, and do particular honour to their sex. His advices, with regard to love, courtship, and marriage, are peculiarly wise, and interesting to them. They show what careful observation he had made on female domestic conduct, and on the different effects of possessing or wanting the virtues and qualities which he recommends. There is something peculiarly curious, animated, and useful, in his directions to them, how to judge of, and manifest an honourable passion in, and towards the other sex, and in the very accurate and useful distinction which he makes between true and false delicacy. Nothing can be more striking and affecting, nothing more likely to give his paternal advices their desired effect, than the respectful and affectionate manner in which he mentions his lady their mother, and the irreparable loss which he and they sustained by her early death. In short, in this tract, the professor shines with peculiar lustre as a husband and father, and it is admirably adapted to promote domestic happiness.

These letters to his daughters were evidently written under the impression of an early death, which Dr Gregory had reason to apprehend from a constitution subject to the gout, which had begun to show itself at irregular intervals even from the 18th year of his age. His mother, from whom he inherited that disease, died suddenly in 1770, while sitting at table. Dr Gregory had prognosticated for himself a similar death; an event of which, among his friends, he often talked, but had no apprehension of the nearness of its approach. In the beginning of the year 1773, in conversation with his son the present Dr James Gregory, the latter remarking, that having for the three preceding years had no return of a fit, he might make his account with a pretty severe attack at that season; he received the observation with some degree of anger, as he felt himself then in his usual state of health. The prediction, however, was too true; for having gone to bed on the 9th of February 1773, with no

apparent disorder, he was found dead in the morning. His death had been instantaneous, and probably in his sleep; for there was not the smallest discomposure of limb or of feature,—a perfect *Euthanasia*.

Dr Gregory, in person, was considerably above the middle size. His frame of body was compacted with symmetry, but not with elegance. His limbs were not active; he stooped somewhat in his gait; and his countenance, from a fullness of feature and a heaviness of eye, gave no external indication of superior power of mind or abilities. It was otherwise when engaged in conversation. His features then became animated, and his eye most expressive. He had a warmth of tone and of gesture which gave a pleasing interest to every thing which he uttered: But, united with this animation, there was in him a gentleness and simplicity of manner, which, with little attention to the exterior and regulated forms of politeness, was more engaging than the most finished address. His conversation flowed with ease; and, when in company with literary men, without affecting a display of knowledge, he was liberal of the stores of his mind. He possessed a large share of the social and benevolent affections, which, in the exercise of profession, manifested themselves in many nameless, but important, attentions to those under his care; attentions which, proceeding in him from an extended principle of humanity, were not squared to the circumstances or rank of the patient, but ever bestowed most liberally where they were most requisite. In the care of his pupils, he was not satisfied with a faithful discharge of his public duties. To many of these, strangers in the country, and far removed from all who had a natural interest in their concerns, it was matter of no small importance to enjoy the acquaintance and countenance of one so universally respected and esteemed. Through him they found an easy introduction to an enlarged and elegant society; and, what to them was still more valuable, they experienced in him a friend who was ever easy of access, and ready to assist them to the utmost with his counsel and patronage.—The same spirit of philanthropy endeared him in a particular manner to his intimate friends; among whom may be ranked most of the Scottish literati of his time.—Some time after his death, the professorship of the Theory of Medicine was bestowed upon his eldest son the present Dr James Gregory; who has since succeeded to the Practical Chair, lately filled by that other most eminent professor Dr Cullen.

GRE-HOUND. See CANIS.—Among a litter of gre-hound puppies, the best are always those which are lightest. These will make the nimblest dogs as they grow up. The gre-hound is best for open countries where there is little covert. In these places there will sometimes be a course after a hare of two or three miles or more, and both the dogs and the game in sight all the while. It is generally supposed that the gre-hound bitch will beat the dog in running: but this seems to be an error; for the dog is both longer made, and considerably stronger, than the bitch of the same kind. In the breeding these dogs the bitch is principally to be regarded; for it is found by experience, that the best dog and a bad bitch will not get so good puppies as an indifferent dog with a good bitch. The dog and bitch should be as nearly as may be of the same

Gregory,
Gre-
hound.

Gre-
hound,
Grenada.

same age; and for the breeding of fine and perfect dogs, they should not be more than four years old. An old bitch may be used with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing.

The general food for a gre-hound ought to be chippings or raspings of bread, with soft bones and gristles; and those chippings ought always to be soaked in beef or mutton broth.

The proper exercise for a gre-hound is coursing him three times a week, and rewarding him with blood; which will animate him in the highest degree, and encourage him to prosecute his game. But the hare also should ever have fair play. She should have the law, as it is called; that is, have leave to run about twelve score yards before the dog is slipped at her, that he may have some difficulty in the course, and not pick up the game too easily. If he kills the hare, he must never be suffered to tear her; but she must be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet washed with butter and beer, and about an hour after he is to be fed.

When the dog is to be taken out to course, he should have nothing in the morning but a toast and butter, and then he is to be kennelled till taken out to the field. The kennelling these dogs is of great use, always giving them spirit and nimbleness when they are let loose; and the best way of managing a fine gre hound is, never to let him stir out of the kennel, except at the times of feeding, walking, or coursing.

GRENADE, one of the Caribbee islands, lying in W. Long. 61. 40. N. Lat. 12. 0. It is the last of the Windward Caribbees; and lies 30 leagues north of new Andalusia, on the continent. According to some, it is 24 leagues in compass; according to others, only 22; and it is said to be 30 miles in length, and in some places 15 in breadth. The chief port, formerly called *Louis*, now *St George's*, stands on the west side of the island, in the middle of a large bay, with a sandy bottom. It is pretended that 1000 barks, from 300 to 400 tons, may ride secure from storms; and that 100 ships, of 1000 tons each, may be moored in the harbour. A large round basin, which is parted from it by a bank of sand, would contain a considerable number of ships, if the bank was cut through: but by reason of it the large ships are obliged to pass within 80 paces of one of the mountains lying at the mouth of the harbour; the other mountain lying about half a mile distant. The island abounds with wild game and fish; it produces also very fine timber, but the cocoa-tree is observed not to thrive here so well as in the other islands. A lake on a high mountain, about the middle of the island, supplies it with fresh-water streams. Several bays and harbours lie round the island, some of which might be fortified to great advantage; so that it is very convenient for shipping, not being subject to hurricanes. The soil is capable of producing tobacco, sugar, indigo, pease, and millet.

In 1638, M. Poincy, a Frenchman, attempted to make a settlement in Grenada; but was driven off by the Caribbeans, who resorted to this island in greater numbers than to the neighbouring ones, probably on

account of the game with which it abounded. In 1650, Mons. Parquet, governor of Martinico, carried over from that island 200 men, furnished with presents to reconcile the savages to them; but with arms to subdue them, in case they should prove intractable. The savages are said to have been frightened into submission by the number of the Frenchmen: but, according to some French writers, the chief not only welcomed the new-comers; but, in consideration of some knives, hatchets, scissars, and other toys, yielded to Parquet the sovereignty of the island, reserving to themselves their own habitations. The Abbé Raynal informs us, that these first French colonists, *imagining* they had purchased the island by these trifles, assumed the sovereignty, and soon acted as tyrants. The Caribs, unable to contend with them by force, took their usual method of murdering all those whom they found in a defenceless state. This produced a war; and the French settlers having received a reinforcement of 300 men from Martinico, forced the savages to retire to a mountain; from whence, after exhausting all their arrows, they rolled down great logs of wood on their enemies. Here they were joined by other savages from the neighbouring islands, and again attacked the French, but were defeated anew; and were at last driven to such desperation, that 40 of them, who had escaped from the slaughter, jumped from a precipice into the sea, where they all perished, rather than fall into the hands of their implacable enemies. From thence the rock was called *le morne des sauteurs*, or "the hill of the leapers;" which name it still retains. The French then destroyed the habitations and all the provisions of the savages; but fresh supplies of Caribbeans arriving, the war was renewed with great vigour, and great numbers of the French were killed. Upon this they resolved totally to exterminate the natives: and having accordingly attacked the savages unawares, they inhumanly put to death the women and children, as well as the men; burning all their boats and canoes, to cut off also communication between the few survivors and the neighbouring islands. Notwithstanding all these barbarous precautions, however, the Caribbees proved the irreconcilable enemies of the French; and their frequent insurrections at last obliged Parquet to sell all his property in the island to the Count de Cerillac in 1657. The new proprietor, who purchased Parquet's property for 30,000 crowns, sent thither a person of brutal manners to govern the island. He behaved with such insupportable tyranny, that most of the colonists retired to Martinico; and the few who remained condemned him to death after a formal trial. In the whole court of justice that tried this miscreant, there was only one man (called *Archangeli*) who could write. A farrier was the person who impeached: and he, instead of the signatures, sealed with a horse-shoe; and Archangeli, who performed the office of clerk, wrote round it these words in French, "Mark of Mr de la Brie, counsel for the court."

It was apprehended that the court of France would not ratify a sentence passed with such unusual formalities; and therefore most of the judges of the governor's crimes, and witnesses of his execution, disappeared. Only those remained whose obscurity screened them from the pursuit of the laws. By an estimate,

Grenada taken in 1700, there were at Grenada no more than 251 white people, 53 free savages or mulattoes, and 525 slaves. The useful animals were reduced to 64 horses and 569 head of horned cattle. The whole culture consisted of 3 plantations of sugar and 52 of indigo.—The island had been sold in 1664 to the French West India company for 100,000 livres.

This unfavourable state of the affairs of Grenada was changed in 1714. The change was owing to the flourishing condition of Martinico. The richest of the ships from that island were sent to the Spanish coasts, and in their way touched at Grenada to take in refreshments. The trading privateers, who undertook this navigation, taught the people of that island the value of their soil, which only required cultivation. Some traders furnished the inhabitants with slaves and utensils to erect sugar plantations. An open account was established between the two colonies. Grenada was clearing its debts gradually by its rich produce; and the balance was on the point of being closed, when the war in 1744 interrupted the communication between the two islands, and at the same time stopped the progress of the sugar-plantations. This loss was supplied by the culture of coffee, which was pursued during the hostilities with all the activity and eagerness that industry could inspire.—The peace of 1748 revived all the labours, and opened all the former sources of wealth. In 1753 the population of Grenada consisted of 1262 white people, 175 free negroes, and 11,991 slaves. The cattle amounted to 2298 horses or mules, 2456 head of horned cattle, 3278 sheep, 902 goats, and 331 hogs. The cultivation rose to 83 sugar-plantations, 2,725,600 coffee-trees, 150,300 cocoa-trees, and 800 cotton-plants. The provisions consisted of 5,740,450 trenches of cassada, 933,596 banana trees, and 143 squares of potatoes and yams. The colony made a rapid progress, in proportion to the excellence of its soil; but in the course of the last war but one the island was taken by the British. At this time one of the mountains at the side of St George's harbour was strongly fortified, and might have made a good defence, but surrendered without firing a gun; and by the treaty concluded in 1763 the island was ceded to Britain. On this cession, and the management of the colony after that event, the Abbé Raynal has the following remarks.—“This long train of evils [the ambition and mismanagement of his countrymen] has thrown Grenada into the hands of the English, who are in possession of this conquest by the treaty of 1763. But how long will they keep this colony? Or, will it never again be restored to France?—England has not made a fortunate beginning. In the first enthusiasm raised by an acquisition, of which the highest opinion had been previously formed, every one was eager to purchase estates there. They sold for much more than their real value. This caprice, by expelling old colonists who were inured to the climate, has sent about L. 1,553,000 out of the mother-country. This imprudence has been followed by another. The new proprietors, misled, no doubt, by national pride, have substituted new methods to those of their predecessors. They have attempted to alter the mode of living among their slaves. The negroes, who from their very ignorance are more attached to their customs than other men, have revolted. It hath been

found necessary to send out troops, and to shed blood. The whole colony was filled with suspicions. The masters who had laid themselves under a necessity of using violent methods, were afraid of being burnt or massacred in their own plantations. The labours have declined, or been totally interrupted. Tranquillity has at length been restored. The number of slaves has been increased as far as 40,000, and the produce has been raised to the treble of what it was under the French government. The plantations will still be improved by the neighbourhood of a dozen of islands, called the *Grenadines* or *Grenadilloes*, that are dependent on the colony. They are from three to eight leagues in circumference, but do not afford a single spring of water. The air is wholesome. The ground, covered only with thin bushes, has not been screened from the sun. It exhales none of those noxious vapours which are fatal to the husbandman. Carriacou, the only one of the Grenadines which the French have occupied, was at first frequented by turtle fishermen; who, in the leisure afforded them by so easy an occupation, employed themselves in clearing the ground. In process of time, their small number was increased by the accession of some of the inhabitants of Guadeloupe; who, finding that their plantations were destroyed by a particular sort of ants, removed to Carriacou. The island flourished from the liberty that was enjoyed there. The inhabitants collected about 1200 slaves, by whose labours they made themselves a revenue of near 20,000 a-year in cotton.—The other Grenadines do not afford a prospect of the same advantages, though the plantation of sugar is begun there. It has succeeded remarkably well at Becouya, the largest and most fertile of these islands, which is no more than two leagues distant from St Vincent.”

In the year 1779 the conquest of this island was accomplished by D'Estaing the French admiral, who had been prevented from attempting it before by his enterprise against St Vincent. Immediately after his conquest of St Lucia, however, being reinforced by a squadron under M. de la Motte, he set sail for Grenada with a fleet of 26 sail of the line and 12 frigates, having on board 10,000 land forces. Here he arrived on the second of July; and landed 3000 troops, chiefly Irish, being part of the brigade composed of natives of Ireland in the service of France. These were conducted by Count Dillon, who disposed them in such a manner as to surround the hill that overlooks and commands George's Town, together with the fort and harbour. To oppose these, Lord M'Cartney, the governor, had only about 150 regulars, and 300 or 400 armed inhabitants; but though all resistance was evidently vain, he determined nevertheless to make an honourable and gallant defence. The preparations he made were such as induced D'Estaing himself to be present at the attack; and, even with his vast superiority of force, the first attack on the entrenchments proved unsuccessful. The second continued two hours; when the garrison were obliged to yield to the immense disparity of numbers who assaulted them, after having killed or wounded 300 of their antagonists. Having thus made themselves masters of the intrenchments on the hill, the French turned the cannon of them towards the fort which lay under it; on which the governor demanded a capitulation. The terms, however, were

Grenada;

Grenada.

were so extraordinary and unprecedented, that both the governor and inhabitants agreed in rejecting them; and determined rather to surrender without any conditions at all than upon those which appeared so extravagant. On this occasion D'Estaing is said to have behaved in a very haughty and severe manner; indulging his soldiers also in the most unwarrantable liberties, and in which they would have proceeded much farther had they not been restrained by the Irish troops in the French service.

In the mean time admiral Byron, who had been convoying the homeward-bound West India fleet, hastened to St Vincent, in hopes of recovering it; but being informed, by the way, that a descent had been made at Grenada, he changed his course, hoping that Lord M'Cartney would be able to hold out till his arrival. On the sixth of July he came in sight of the French fleet; and, without regarding D'Estaing's superiority of six ships of the line and as many frigates, determined if possible to force him to a close engagement. The French commander, however, was not so confident of his own prowess as to run the risk of an encounter of this kind; and having already achieved his conquest, had no other view than to preserve it. His designs were facilitated by the good condition of his fleet; which being more lately come out of port than that of the British, sailed faster, so that he was thus enabled to keep at what distance he pleased. The engagement began about eight in the morning, when admiral Barrington with his own and two other ships got up to the van of the enemy, which they attacked with the greatest spirit. As the other ships of his division, however, were not able to get up to his assistance, these three ships were necessarily obliged to encounter a vast superiority, and of consequence suffered exceedingly. The battle was carried on from beginning to end in the same unequal manner; nor were the British commanders, though they used their utmost efforts for this purpose, able to bring the French to a close engagement. Thus captains Collingwood, Edwards, and Cornwallis, stood the fire of the whole French fleet for some time. Captain Fanshaw of the Monmouth, a 64 gun ship, threw himself singly in the way of the enemy's van; and admiral Rowley and captain Butchart fought at the same disadvantage: so that finding it impossible to continue the engagement with any probability of success, a general cessation of firing took place about noon. It recommenced in the same manner about two in the afternoon; and lasted, with different interruptions, till the evening. During this action some of the British ships had forced their way into St George's harbour, not imagining that the enemy were already in possession of the island. They were soon undeceived, however, by perceiving the French colours flying ashore, and the guns and batteries firing at them. This discovery put an end to the design which had brought on the engagement; and as it was now high time to think of providing for the safety of the British transports, which were in danger from the number of the enemy's frigates, the engagement was finally discontinued. During this action some of admiral Byron's ships had suffered extremely. The Lion of 64 guns, captain Cornwallis, was found incapable of rejoining the fleet which were plying to windward; and was therefore obliged to bear away

N^o 144.

alone before the wind. Two other ships lay far astern in a very distressed situation; but no attempt was made to capture them, nor did the French admiral show the least inclination to renew the engagement.

Grenada was restored to Great Britain by the late treaty of peace.—George's town, or St George's, is the residence of the governor; and the present governor, general Matthew, made a present to the citizens of a clock and bells last spring (1790). The garrison consisted at that time of artillery, two regiments of Europeans, and one of blacks. As there are several small islands subject to the laws enacted in Grenada, they each elect a person to represent them in the general assembly, which is always held in St George's. As none of the Grenadines have a harbour fit for large vessels, the produce of them is conveyed in small vessels to St George's, from whence it is exported to the different places of Europe, Africa, America, &c. From the number of vessels that arrive there yearly from different places, and from its being the seat of the legislature, it has become so populous, that two news papers are published in it. On occasion of the late prospect of a war with Spain, an act was passed here in February 1790, obliging every gentleman to give in upon oath the value of his estate, and the number of blacks upon it, in order that the general assembly might ascertain the number of slaves each should send to work upon the fortifications on Richmond-hill, near St George's.

GRENADINES, or GRENADILLOS. See the preceding article.—It is there mentioned that the Grenadines do not afford a single drop of fresh water. A small spring however has been lately discovered in the principal island Carriacou, by digging; but being of great value, it is kept locked by the proprietor Mr Mayes. The capital of that island is called Hillsborough, in which there is a small church.

GRENAILLE, a name given by the French writers to a preparation of copper, which the Chinese use as a red colour in some of their finest china, particularly for that colour which is called *oil-red*, or *red in oil*. The china-ware coloured with this is very dear. The manner in which they procure the preparation is thus: they have in China no such thing as silver-coined money, but they use in commerce bars or masses of silver; these they pay and receive in large bargains; and among a nation so full of fraud as the Chinese, it is no wonder that these are too often adulterated with too great an alloy of copper. They pass, however, in this state in the common payments. There are some occasions, however, such as the paying the taxes and contributions, on which they must have their silver pure and fine: on this occasion they have recourse to certain people, whose sole business it is to refine the silver, and separate it from the copper and the lead it contains. This they do in furnaces made for the purpose, and with very convenient vessels. While the copper is in fusion, they take a small brush, and dip the end of it into water; then striking the handle of the brush, they sprinkle the water by degrees upon the melted copper; a sort of pellicle forms itself by this means on the surface of the matter, which they take off while hot with pincers of iron, and immediately throwing it into a large vessel of cold water, it forms that red powder which is called the *grenaille*; they repeat

Grenadines
||
Grenaille.

Grenoble, peat the operation every time they in this manner separate the copper; and this furnishes them with as much of the *grenaille* as they have occasion for in their china works.

GRENOBLE, a large, populous, and ancient town of Dauphiny in France, with a bishop's see. It contains a great number of handsome structures, particularly the churches and convents. The leather and gloves that are made here are highly esteemed. It is seated on the river Isere, over which there are two bridges to pass into that part called *Perriere*, a large street on the other side of the river. E. Long. 5. 49. N. Lat. 45. 12.

GRESHAM (Sir Thomas), an opulent merchant of London, descended from an ancient and honourable family of Norfolk, was born in 1519. He was, as his father had been before him, appointed king's agent at Antwerp, for taking up money of the merchants; and in 1551, he removed to that city with his family. This employment was suspended on the accession of queen Mary: but on proper representations, was restored to him again. Queen Elizabeth conferred the honour of knighthood upon him, and made him her agent in foreign parts. It was at this time he thought proper to provide himself with a mansion-house in the city, suitable to his station and dignity; with which intention he built a large house on the west side of Bishopsgate-street, afterwards known by the name of *Gresham college*. His father had proposed building a house or exchange for the merchants to meet in, instead of walking in the open street; but this design remained for the son to accomplish. Sir Thomas went beyond his father: he offered, if the citizens would provide a proper piece of ground, to build a house at his own expence; which being accepted, he fulfilled his promise after the plan of the exchange at Antwerp. When the new edifice was opened, the queen (Jan. 29. 1570) came and dined with the founder; and caused a herald with a trumpet to proclaim it by the name of the *Royal Exchange*. In pursuance also of a promise to endow a college for the profession of the seven liberal sciences, he made a testamentary disposition of his house in London for that purpose; leaving one moiety of the royal exchange to the corporation of London, and the other to the mercers company, for the salaries of seven lecturers in divinity, law, physic, astronomy, geometry, music, and rhetoric, at 50 l. each *per annum*. He left several other considerable benefactions, and died in 1579. As to the college, it has been pulled down within these 14 or 15 years, in consequence of an application to parliament from the city, and the excise-office erected in its place. The lectures are read, or rather hurried through, in a chamber over the Royal Exchange.—Those who have drawn Sir Thomas's character observe, that he had the happiness of a mind every way suited to his fortune, generous and benign; ready to perform any good actions, and encourage them in others. He was a great friend and patron of our celebrated martyrologist John Fox. He was well acquainted with the ancient and several modern languages; he had a very comprehensive knowledge of all affairs relating to commerce, whether foreign or domestic; and his success was not less, being in his time esteemed the highest commoner in England. He

VOL. VIII. Part I

transacted queen Elizabeth's mereantile affairs so constantly, that he was called *the royal merchant*; and his house was sometimes appointed for the reception of foreign princes upon their first arrival at London.

GREVILLE (Fulke), lord Brook, of Beauchamp's Court in Warwickshire, a poet and miscellaneous writer, was born in the year 1554, and descended from the noble families of Beauchamps of Powick and Willoughby de Brook. In company with his cousin Sir Philip Sidney, he began his education at a school in Shrewsbury: thence he went to Oxford, where he remained for some time a gentleman commoner, and then removed to Trinity-College in Cambridge. Having left the university; he visited foreign courts, and thus added to his knowledge of the ancient languages a perfect knowledge of the modern. On his return to England he was introduced to queen Elizabeth by his uncle Robert Greville, at that time in her majesty's service; and by means of Sir Henry Sidney, lord president of Wales, was nominated to some lucrative employments in that principality.

In the year 1581, when the French commissioners who came to treat about the queen's marriage with the duke of Anjou were sumptuously entertained with tilts and tournaments, Mr Greville, who was one of the challengers, so signalized himself, as to "win the reputation of a most valiant knight." He continued a constant attendant at court, and a favourite with the queen to the end of her reign; during which he obtained the office of treasurer of marine causes, also a grant of the manor of Wedgnoek, and likewise the honour of knighthood. In this reign he was several times elected member for the county of Warwick; and from the journals of the house seems to have been a man of business, as his name frequently appears in committees.

On the accession of king James I. he was installed knight of the Bath; and soon after obtained a grant of the ruinous castles of Warwick, which he repaired at a considerable expence, and where he probably resided during the former part of this reign: but in the year 1614, the twelfth of James I. he was made under-treasurer, and chancellor of the exchequer, one of the privy council, and gentleman of the bed-chamber; and in the 1620, was raised to the dignity of a baron by the title of lord Brook of Beauchamp's Court. He was also privy-counsellor to King Charles I. in the beginning of whose reign he founded a history-lecture in Cambridge.

Having thus attained the age of 74, through a life of continued prosperity, universally admired as a gentleman and a scholar, he fell by the hand of an assassin, one of his own domestics, who immediately stabbed himself with the same weapon with which he had murdered his master. This fellow's name was Haywood; and the cause is said to have been a severe reprimand for his presumption in upbraiding his master for not providing for him after his death. It seems he had been witness to lord Brook's will, and knew the contents. Some say he stabbed him with a knife in the back, others with a sword. This affair happened at Brook-house in Holborne.—Lord Brook was buried with great pomp in St Mary's church at Warwick, in his own vault, over which he had erected a monument of black and white marble, ordering at his death

S

the

Greville.

Grevius
||
Grewia.

the following inscription to be engraved upon the tomb: "Fulke Greville, servant to queen Elizabeth, counsellor to king James, and friend to Sir Philip Sidney. *Trophæum Peccati*." He wrote several works both in verse and prose; among which are, 1. Two tragedies, *Alaham* and *Mustapha*. 2. A Treatise of Human Learning, &c. in verse, folio. 3. The Life of Sir Philip Sidney. 4. An Inquisition upon Fame and Honour, in 86 stanzas. 6. *Cæcilia*, a collection of 109 songs. 7. His Remains, consisting of political and philosophical poems.

GREVIUS. See GRÆVIUS.

GREW (Nehemiah), a learned English writer, in the 17th century, had a considerable practice as a physician in London, and succeeded Mr Oldenburgh in the office of secretary to the royal society. In this capacity, pursuant to an order of council, he drew up a catalogue of the natural and artificial rarities belonging to the society, under the title of *Museum Regalis Societatis*, &c. 1681. He also wrote, besides several pieces in the Philosophical Transactions, 1. The Comparative Anatomy of the Stomach and Guts, folio. 2. The Anatomy of Plants, folio. 3. *Traçtatus de salis Cathartici natura et usu*. 4. *Cosmologia Sacra*, or a Discourse of the Universe as it is the Creature and Kingdom of God, folio. He died suddenly in 1721.

GREWIA, in botany: A genus of the polyandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 37th order, *Columnifera*. The calyx is pentaphyllous; there are five petals, each with a nectariferous scale at the base; the berry is quadrilocular.

Species. 1. The *occidentalis*, with oval crenated leaves, has long been preserved in many curious gardens both in England and Holland. It is a native of the Cape of Good Hope, and grows to the height of 10 or 12 feet. The stem and branches greatly resemble those of the small leaved elm, the bark being smooth, and of the same colour with that when young. The leaves are also very like those of the elm, and fall off in autumn. The flowers are produced singly along the young branches from the wings of the leaves, and are of a bright purple colour. 2. The *Africana*, with oval spear-shaped serrated leaves, is a native of Senegal in Africa, from whence its seeds were brought by Mr Adanson. In this country it rises with a shrubby stalk five or six feet high, sending out many lateral branches, with a brown hairy bark, and garnished with spear-shaped serrated leaves; but the plants have not flowered in Britain.

Culture and uses. The first sort, though a native of a warm climate, will bear the open air in this country; only requiring to be sheltered in a green-house during the winter-time. It may be propagated by cuttings or layers planted in pots filled with soft loamy earth. The second sort is tender, and must be kept constantly in a warm bark-stove. In summer, they require a large share of the free air to be admitted to them, and should have water three or four times a-week in warm weather; but in the winter they must be sparingly watered.—The negroes of Senegal highly value a decoction of the bark of this last species, and use it as a never-failing remedy against venereal complaints.

GREY, or GRAY colour. See GRAY.

GREY (Lady Jane), a most illustrious and unfortunate lady, descended of the blood-royal of England by both parents, was the eldest daughter of Henry Grey marquis of Dorset and Frances the daughter of Charles Brandon lord Suffolk, by Mary the dowager of Louis XII. king of France, who was the youngest daughter of Henry VII. king of England. She was born in the year 1537, at Broadgate, her father's seat in Leicestershire. She discovered an early propensity to all kinds of good literature; and having a fine genius, improved under the tuition of Mr Elmer, she made a most surprising progress in the languages, arts, and sciences. She understood perfectly both kinds of philosophy, and could express herself very properly at least in the Latin and Greek tongues; and we are informed by Sir Thomas Chaloner (in Strype's Memorials, Vol. III. p. 93.), that she was well versed in Hebrew, Chaldee, Arabic, French, and Italian; "and (he adds) she played well on instrumental music, writ a curious hand, and was excellent at the needle." Chaloner also tells us, that she accompanied her musical instruments with a voice exquisitely sweet in itself, assisted by all the graces that art could bestow.

In the year 1553, the dukes of Suffolk and Northumberland, who were now, after the fall of Somerset, arrived at the height of power, began, on the decline of the king's health, to think how to prevent that reverse of fortune which, as things then stood, they foresaw must happen upon Edward's death. To obtain this end, no other remedy was judged sufficient but a change in the succession of the crown, and transferring it into their own families, by rendering Lady Jane queen. Those most excellent and amiable qualities which had rendered her dear to all who had the happiness to know her, joined to her near affinity to the king, subjected her to become the chief tool of an ambition so notoriously not her own. Upon this very account she was married to lord Guilford Dudley, fourth son of the duke of Northumberland, without discovering to her the real design of the match; which was celebrated with great pomp in the latter end of May, so much to the king's satisfaction, that he contributed bounteously to the expence of it from the royal wardrobe. The young king Edward VI. died in July following; and our fair scholar, with infinite reluctance, overpowered by the solicitations of her ambitious friends, allowed herself to be proclaimed queen of England, on the strength of a deed of settlement extorted from that prince by her father-in-law the duke of Northumberland, which set aside the succession of queen Mary, queen Elizabeth, and Mary queen of Scots. Her regal pageantry continued but a few days. Queen Mary's undoubted right prevailed; and the unfortunate Lady Jane Grey and her husband were committed to the Tower, and on the 13th of November arraigned and found guilty of high treason. On the 12th of February following they were both beheaded on Tower-hill. Her magnanimity in this dreadful catastrophe was astonishing. Immediately before her execution, she addressed herself to the weeping multitude with amazing composure and coherency: she acknowledged the justice of the law, and died in charity with that wretched world which she had so much reason to execrate. Thus did

Grey.

Grey
||
Gribaldus

did the pious Mary begin her reign with the murder of an innocent young creature of 18; who for simplicity of manners, purity of heart, and extensive learning, was hardly ever equalled in any age or country. But, alas! Jane was an obstinate heretic.—A few days before her execution, Fleckenham, the queen's chaplain, with a pious intention to rescue her poor soul from eternal misery, paid her frequent visits in the Tower, and used every argument in his power to convert her to the Popish religion: but he found her so much his superior in argument, that he gave up the contest; resigning her body to the block, and her soul to the devil.

Her writings are, 1. Four Latin Epistles; three to Bullenger, and one to her sister lady Catharine. The last was written, the night before her execution, in a blank leaf of a Greek Testament. Printed in a book intitled *Epistolæ Helveticæ Reformatoribus, vel ad eos scriptæ*, &c. Tiguri, 1742, 8vo. 2. Her Conference with Fleckenham. (Ballard). 3. A letter to Dr Harding, her father's chaplain. Printed in the Phoenix, vol. ii. p. 28. 4. A Prayer for her own use during her confinement. In Fox's acts and monuments. 5. Four Latin verses; written in prison with a pin. They are as follows:

Non aliena putes, homini quæ obtingere possunt:
Sors hodierna mihi, tunc erit illa tibi.

Jane Dudley.

Deo juvante, nil nocet livor malus:
Et non juvante, nil juvat labor gravis.
Post tenebras spero lucem.

6. Her Speech on the Scaffold. (Ballard). It began thus: "My Lords, and you good Christian people who come to see me die; I am under a law, and by that law, as a never-erring judge, I am condemned to die: not for any thing I have offended the queen's majesty; for I will wash my hands guiltless thereof, and deliver to my God a soul as pure from such trespass as innocence from injustice; but only for that I consented to the thing I was enforced unto, constraint making the law believe I did that which I never understood," &c.—Hollinshed, Sir Richard Baker, Bale, and Fox, tell us that she wrote several other things, but do not mention where they are to be found.

GREY-Hound. See GRE-Hound.

GRIAS, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is tetrapetalous; the calyx quadrifid; the stigma sessile and cruciform; the fruit is a plum with an eight-furrowed kernel. There is but one species, the cauliflora or anchovy-pear, a native of Jamaica. The leaves are nearly oval, and about three feet long. It has a straight stem, upon the upper part of which come forth the flowers. The fruit is large, and contains a stone with eight furrows. These fruits are eaten by the inhabitants.

GRIBALDUS (Matthew), a learned civilian of Padua, left Italy in the 16th century, in order to make a public profession of the Protestant religion. After having been for some time professor of the civil law at Tübingen, he was obliged to make his escape to avoid the punishment he would have incurred had he been convicted of differing from Calvin with respect to

the doctrine of the Trinity: but he was seized at Berne, where he would have met with very severe treatment had he not pretended to renounce his opinions; but as he relapsed again, he would certainly have been put to death, had he not died of the plague in 1664. He wrote *De methodo ac ratione studendi in juri civili*; and several other works which are esteemed.

GRIBNER (Michael Henry), a learned civilian of Germany, was born at Leipzig in 1682. After writing some time in the journal of Leipzig, he was made professor of law at Wittemberg: whence he passed to Dresden, and was at last recalled to Leipzig to succeed M. Mencke. He died in 1734. Besides several academical dissertations, he wrote, 1. *Principia processus judicarii*; 2. *Principia jurisprudentiæ naturalis*, a small work much esteemed; 3. *Opuscula juris publici et privati*.

GRIEF, or SORROW. The influence of this passion on the body is very great. Its effects resemble in several instances those of fear, with, however, some variations, owing perhaps to its being in general of longer duration. Grief diminishes the bodily strength in general, and particularly the force of the heart and circulation; as appears by the frequent sighs and deep respirations which attend it, which seem to be necessary exertions, in order to promote the passage of the blood through the lungs. It diminishes perspiration, obstructs the menstrual discharge, produces paleness of the skin, and œdematous complaints, and scirrhus of the glandular parts. It aggravates the scurvy, and the malignity of putrid and contagious distempers, and renders people more apt to receive the infection of them. When it comes on suddenly, and in a great degree, it causes a palpitation of the heart, and renders the pulse irregular. Blindness, gangrene, and sudden death, have followed the excess of this sensation. Its effects of changing the colour of the hair are well known. Opiates, if not given in large doses, are good cordials in this case.

GRIELUM, in botany: A genus of the pentagynia order, belonging to the decandria class of plants. The calyx is quinquefid; there are five petals; the filaments persisting; and there are five monospermous seed-cases.

GRIERSON (Constantia), born of poor parents in the county of Kilkenny in Ireland, was one of the most learned women on record, though she died at the age of 27, in 1733. She was an excellent Greek and Latin scholar; and understood history, divinity, philosophy, and mathematics. She proved her skill in Latin by her dedication of the Dublin edition of Tacitus to lord Carteret, and by that of Terence to his son; to whom she also addressed a Greek epigram. She wrote many elegant English poems, several of which were inserted by Mrs Barber among her own. When lord Carteret was lord lieutenant of Ireland, he obtained a patent for Mr Grierson to be the king's printer; and to reward the uncommon merit of his wife, caused her life to be included in it.

GRIFFON (GRYPHUS, γρυψ), in the natural history of the ancients, the name of an imaginary bird of prey, of the eagle kind. They represented it with four legs, wings, and a beak; the upper part representing an eagle, and the lower a lion: they supposed it to watch over gold mines, hidden treasures, &c.

Gräner
||
Griffon.

Grifflea,
Grimaldi.

The animal was consecrated to the sun; and the ancient painters represented the chariot of the sun as drawn by griffions. M. Spanheim observes the same of those of Jupiter and Nemesis.

The griffon in Scripture is that species of the eagle called in Latin *offisfraga*, the "osprey;" and פֶּרֶס, of the verb פָּרַס, *paras*, "to break."

The griffon is frequently seen on ancient medals; and is still borne in coat-armour. Guillim blazons it rampant; alleging, that any very fierce animal may be so blazoned as well as the lion. Sylvester, Morgan, and others, use the terms *segreiant* instead of rampant.

This is also an ornament of architecture in constant use among the Greeks, and was copied from them, with the other elegancies of architectural enrichments, by the Romans. See SPHYNX.

GRIFLEA, in botany: A genus of the monogynia order, belonging to the octandria class of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is quadrid; and there are four petals, one from each incisure of it. The filaments are very long, ascending or turning upwards; the capsule is globose, superior, unilocular, and polyspermous.

GRIMALDI (Francisco), an eminent painter, generally known by the appellation of *Bolognese*, was born at Bologna in 1606, where he became a disciple of Annibal Caracci, and proved an honour to that illustrious master. From the school of Annibal he went to complete his studies at Rome, and improved himself daily, by copying the works of those artists in which he observed the greatest excellence, until his superior talents recommended him to the favour of Innocent X. who afforded him immediate opportunities of exerting his genius in the gallery of his palace at Monte Cavallo, and also in the Vatican. The merit of his performances very soon engaged the attention and applause of the public, and increased the number of his admirers and friends; among whom were the prince Pamphilio, and many of the principal nobility of Rome. His reputation reached cardinal Mazarine at Paris, who sent for him, settled a large pension on him, and employed him for three years in embellishing his palace and the Louvre, by the order of Louis XIII. The troubles of the state, and the clamours raised against the cardinal, whose party he warmly espoused, put him so much in danger, that his friends advised him to retire among the Jesuits. He did so, and was of use to them; for he painted them a decoration for the exposition of the sacrament during the holy days, according to the custom of Rome. This piece was mightily relished at Paris: the king honoured it with two visits, and commanded him to paint such another for his chapel at the Louvre. Grimaldi after that returned to Italy; and at his arrival at Rome found his great patron Innocent X. dead: but his two successors Alexander VII. and Clement IX. honoured him equally with their friendship, and found him variety of employment. Grimaldi was amiable in his manners, as well as skilful in his profession: he was generous without profusion, respectful to the great without meanness, and charitable to the poor. The following instance of his benevolence may serve to characterise the man. A Sicilian gentleman, who had retired from Messina with his

daughter during the troubles of that country, was reduced to the misery of wanting bread. As he lived over-against him, Grimaldi was soon informed of it; and in the dusk of the evening, knocking at the Sicilian's door, without making himself known, tossed in money and retired. The thing happening more than once, raised the Sicilian's curiosity to know his benefactor; who finding him out, by hiding himself behind the door, fell down on his knees to thank the hand that had relieved him. Grimaldi remained confused, offered him his house, and continued his friend till his death. He died of a dropsy at Rome in 1680, and left a considerable fortune among six children. The genius of Grimaldi directed him chiefly to landscape, which he executed most happily. His colouring is strong; his touch light and delicate; his situations are uncommonly pleasing; and the leafing of his trees is admirable. Sometimes, indeed, his colouring appears rather too green: but those landscapes, which he painted in the manner of the Caracci, may serve as models for all those who admire the style of that school; and he designed his figures in an elegant taste. The pictures of this master are very unfrequent, especially those of his best time; and whenever they are to be purchased, they afford large prices. Of his children above mentioned, the youngest, named *Alexander*, proved a good painter, in the same style and taste with his father, though very far inferior to him: some of the pictures of Alexander, however, are either artfully, or injudiciously, ascribed to Francisco.

GRIMSBY, a large sea-port town of Lincolnshire in England, 169 miles from London; and said to be the second, if not the first, corporation in England. It had anciently three convents and a castle. It is governed by a mayor, high-steward, recorder, twelve aldermen, twelve common council men, two bailiffs, two coroners, a town clerk, and three serjeants at mace. The mayor holds a court here on Tuesday, and the bailiffs on Friday. Here are several streets of good houses, and a church that looks like a cathedral. It was a place of great trade before its harbour was choaked up; yet the road before it is a good station for ships that wait for a wind to get out to sea. Its chief trade is in coals and salt brought by the Humber.

GRINDING, or TRITURATION, the act of breaking or comminuting a solid body, and reducing it into powder. See PULVERISATION and LEVIGATION.

The painters colours are grinded on a marble or porphyry, either with oil or gum-water.

GRINDING is also used for rubbing or wearing off the irregular parts of the surface of a body, and reducing it to the destined figure, whether that be flat, concave, or the like.

The grinding and polishing of glass is a considerable art; for which see *GLASS Grinding*. For the grinding of optical glasses, see OPTICS, the *Mechanical Part*.

GRINSTED, EAST and WEST; two towns near Salisbury in Wiltshire.

GRINSTED, *East*, a town 29 miles from London, seated on a hill, near the borders of Surry, near Ashdown forest. It has a handsome church, which was rebuilt after being burnt down 1683. On November 12, 1785, the beautiful tower having lately fallen to decay, fell down, and part lighting on the church very considerably damaged it. An hospital in the reign of

Grimaldi.

Grinated.

Grinstead || king James I. for 31 poor people of this town was
Grigris. built and endowed with 330 l. a year. It is a bo-
rough by prescription, governed by a bailiff and his
brethren; has sent burgesses to parliament ever since
the first of Edward II. who are elected by about 35
burgage holders; had a charter for a monthly market
from Henry VII. and is generally the place for the
assizes. The returning officer here is the bailiff, who
is chosen by a jury of burgageholders. Its market is on
Thursday, and its fairs, which are well frequented, are
July 13 and December 11; which last is a great one
for Welsh runts, that are brought up here by the
Kentish and Sussex farmers and for fairs hogs and o-
ther cattle.

GRINSTED, *West*, in Sussex, a town above 10 miles
to the south-west of East-Grinstead.

GRIPES, in medicine, a sort of cholic or painful
disorder of the lower belly, occasioned by some sharp
pungent matters vellicating the parts, or by wind pent
up in the intestines. See *Index* subjoined to *MEDI-*
CINE.

GRIPSWALD, a strong and considerable town of
Pomerania in Germany; formerly imperial, but now
subject to the Swedes, with a good harbour and uni-
versity. E. Long. 13. 53. N. Lat. 54. 12.

GRISGRIS, a superstition greatly in vogue among
the negroes in the interior parts of Africa. The gris-
gris, according to Le Maire, are certain Arabic cha-
racters mixed with magical figures drawn by the Ma-
rabuts or priests upon paper. Labat affirms, that they
are nothing else than scraps of the alcoran in Ara-
bic; but this is denied by Barbot, who brought over
one of these grisgris to Europe, and showed it to a
number of persons deeply skilled in oriental learning.
None of these could find the least trace of any charac-
ter they understood. Yet, after all, this might be
owing to the badness of the hand-writing; and the
words are probably of the Mandingo language, though
the characters are an attempt to imitate the Arabic.
The poorest negro never goes to war without his gris-
gris, as a charm against wounds; and if it proves in-
effectual, the priest transfers the blame on the immo-
rality of his conduct. These priests invent grisgris a-
gainst all kinds of dangers, and in favour of all desires
and appetites; by virtue of which the possessors may
obtain or avoid whatever they like or dislike. They
defend them from storms, enemies, diseases, pains, and
misfortunes; and preserve health, long life, wealth,
honour, and merit, according to the Marabuts. No
clergy in the world are more honoured and revered by
the people than these impostors are by the negroes;
nor are any people in the world more impoverished by
their priests than these negroes are, a grisgris being
frequently sold at three slaves and four or five oxen.
The grisgris intended for the head is made in the
form of a cross, reaching from the forehead to the
neck behind, and from ear to ear; nor are the arms
and shoulders neglected. Sometimes they are plant-
ed in their bonnets in the form of horns; at other
times, they are made like serpents, lizards, or some
other animals, cut out of a kind of pasteboard, &c.
There are not wanting Europeans, and otherwise in-
telligent seamen and merchants, who are in some degree
infected with this weakness of the country, and believe
that the negro forcerers have an actual communication

with the devil, and that they are filled with the ma-
lignant influence of that evil spirit, when they see
them distort their features and muscles, make horrid
grimaces, and at last imitate all the appearance of epi-
leptics.

GRISONS, a people situated among the Alps, and
allies of the Swiss. Their country is bounded on the
north by the counties of Surgans and Bludenz, the
canton of Glaris, and the principality of Lichtenstein;
on the south by the canton's Italian bailiwicks, the
county of Chavenne, and the Valteline; on the east
by the territories of Venice and Milan; and on the
west by some of the Italian bailiwicks, and the canton
of Uri. It is divided into three leagues, viz. the
Grison or *grey league*, the *league of the house of God*, and
that of the *ten jurisdictions*; which unite and form one
republic. The two first lie towards the south, and the
third towards the north. The length of the whole is
above 70 miles, and the breadth about 60. The inhabi-
tants are said to have had the name of *Grifons* from the
grey coats they wore in former times. This country,
lying among the Alps, is very mountainous; but the
mountains yield good pasture for cattle, sheep, and
goats, with some rye and barley: in the valleys there
is plenty of grain, pulse, fruits, and wine. This coun-
try also abounds with hogs and wild-fowl; but there is
a scarcity of fish and salt, and their horses are mostly
purchased of foreigners. The principal rivers are the
Rhine, the Inn, and the Adda. Here are also several
lakes, most of which lie on the tops of the hills. The
language of the Grifons is either a corrupt Italian or
the German. Each of the leagues is subdivided into
several lesser communities, which are so many demo-
cracies; every male above 16 having a share in the go-
vernment of the community, and a vote in the election
of magistrates. Deputies from the several communi-
ties constitute the general diet of the Grison leagues,
which meets annually, and alternately at the capital of
each league; but they can conclude nothing without
the consent of their constituents. This country was
anciently a part of Rhetia. After the extinction of
the Roman empire in the west, it was some time sub-
ject to its own dukes, or those of Swabia. Then the
bishop of Coire, and other petty princes, dependant on
the emperors of Germany, became masters of great
part of it: at last, by the extinction of some, pur-
chase, voluntary grants, and force, it got rid of all its
lords, and erected itself into three distinct republics,
each of which, as we observed already, is subdivided
into a certain number of communities, which are a sort
of republics, exercising every branch of sovereignty,
except that of making peace or war, sending embassies,
concluding alliances, and enacting laws relating to the
whole country, which belong to the provincial diets of
the several leagues. The communities may be compa-
red to the cities of Holland, and the diets of the seve-
ral leagues to the provincial states. The particular diets
are composed of a deputy from each community; and
both in them and the communities every thing is deter-
mined by a majority of votes. In the communities,
every male above 16 has a vote. Besides the annual
provincial diets for choosing the chiefs and other offi-
cers, and deliberating on the affairs of the respective
leagues, there are general diets for what concerns all
the three leagues or whole body. In both these, the
repre-

Grisons.

representatives can do nothing of themselves, but are tied down to the instructions of their principals. There is a general seal for all the three leagues; and each particular league has a separate seal. Besides the stated times of meeting, extraordinary diets are sometimes summoned, when either the domestic affairs of the state or any foreign minister require it. In the general diets, the Grey League has 28 votes; that of the House of God, 23; and that of the Ten Jurisdictions, 15. These leagues, at different times, have entered into close alliances with the neighbouring cantons and their associates. The bailiwicks belonging in common to the three leagues are those of the Valtelline, Chiavene, Bormio, Meyenfeld, Malans, and Jennins; the officers of which are nominated successively by the several communities every two years. The yearly revenue arising to the Grisons from their bailiwicks is said to amount to about 13,500 florins. The public revenues altogether are but small, though there are many private persons in the country that are rich. However, in case of any extraordinary emergency, they tax themselves in proportion to the necessity of the service and the people's abilities. They have no regular troops, but a well-disciplined militia; and upon occasion, it is said, can bring a body of 30,000 fighting men into the field: but their chief security arises from the narrow passes and high mountains by which they are surrounded.

Of the jurisprudence, religion, &c. of the Grisons, the following account is given by Mr Coxe in his travels in Switzerland. Throughout the three leagues the Roman law prevails, modified by the municipal customs. The courts of justice in each community are composed of the chief magistrate, who presides, and a certain number of jurymen, chosen by the people: they have no regular salaries, but receive for their attendance a small sum, arising in some communities from the expences of the process, which are defrayed by the criminals; in others from a share of the fines. They enjoy the power of pardoning or diminishing the penalty, and of receiving a composition in money. This mode of proceeding supposes what is as absurd in theory as it is contrary to experience, that judges will incline to mercy when it is their interest to convict; or will impartially inflict punishment, even when injurious to their own private advantage.—The prisoners are examined in private; frequently tortured for the purpose of forcing confession, when the judges either divide the fines, or remit the punishment for a composition. In some districts a criminal trial is a kind of festival to the judges, for whom a good repast is provided at the expence of the prisoner if convicted; and thus the following allusion, in Garth's Dispensary, applied with more wit than truth to our courts of justice, is literally fulfilled:—

'And wretches hang, that jurymen may dine.'

Capital punishments, however, are extremely rare; a circumstance arising not from a want of severity in the penal statutes, or from a propensity to mercy in the judges: but because the latter draw more advantages from fining than executing an offender. In a word, to use the expression of Burnet, which is as true at present as it was in his time, "Many crimes go unpunished, if the persons who commit them have either great credit or much money." It is remarkable, that

torture is more frequently applied, and for smaller delinquencies, in these independent republics, than in the subject provinces. The infliction of it depends entirely upon the arbitrary will of the judges; a majority of whom may order it for an offence which is not capital, nor even punishable by corporal penalties. Thus it is not uncommon, in those communities where fines are divided among the judges, to torture women of loose conduct, for the purpose of compelling them to confess with whom they have been connected; for as such offences are punishable by fines, the more persons are convicted, the larger share of money is distributed among the judges for the trouble of their attendance. Even in the districts where the fines are paid to the community, torture is often no less wantonly inflicted, because, when the prisoner is not found guilty, the expences of the process fall upon the public, and the judges receive little emolument. Even in the civil courts most causes are decided by bribing the judges; and appeals in those communities, wherein they are admitted, scarcely serve any other end than to enlarge the sphere of corruption; Coire, and a few other places, are excepted from this general reflection.

The religion of the Grisons is divided into catholic and reformed. The doctrines of the reformation were first preached about the year 1524, and received at Fläsch a small village in the Ten Jurisdictions upon the confines of Sargans; from thence they were extended to Mayenfeld and Malantz, and soon afterwards through the whole valley of Pretigau. The new opinions spread with such celerity, that before the end of the 16th century they were embraced by the whole league of the Ten Jurisdictions (excepting part of the community of Alvenew), the greatest part of the House of God, and a few communities in the Grey League. The difference of religion nearly excited a civil war between the two sects, as well at the first introduction of the reformation as at the beginning of the troubles in the Valtelline. In the latter instance, the two parties rose in arms; but the Catholics being overpowered by the Protestants, matters were amicably adjusted. Since that period all religious concerns have been regulated with perfect cordiality. According to the general consent of the three leagues, each community being absolute within its little territory, has the power of appointing its own particular worship, and the inhabitants are free to follow either the Catholic or Reformed persuasion. In the administration of civil affairs religion has no interference: the deputies of the general diet may be members of either communion, as chosen by the communities which they represent. By this moderate and tolerating principle, all religious dissensions have been suppressed as much as possible; and the most perfect amity subsists between the two sects.

In spiritual concerns, the Catholics for the most part are under the jurisdiction of the bishop of Coire. For the affairs of the Reformed churches, each league is divided into a certain number of districts, the ministers whereof assemble twice every year: these assemblies are called *colloquia*. Each colloquium has its president, and each league a superintendant called a *dean*. The supreme authority in spiritual concerns is vested in the synod, which is composed of the three deans, and the clergy of each league; the synod assembles every year alternately in each of the three leagues. Candidates for

Grisons.

Grifons
||
Groat.

for holy orders are examined before the synod. The necessary qualifications for admission into the church ought to be the knowledge of Hebrew, Greek, and Latin; but this rule is not strictly adhered to; many being ordained without the least acquaintance with either of those languages. Formerly Latin was solely used, as well in the debates of the synod as for the purpose of examining the candidates; but at present that tongue grows more and more into disuse, and German is employed in its stead.

The number of reformed parishes in the whole three leagues amounts to 135, in the following proportion:—In the Grey League 46, in that of God's House 53, and in the League of Ten Jurisdictions 36. The ministers of these churches enjoy but very small salaries. The richest benefices do not perhaps yield more than L. 20, or at most L. 25 *per annum*, and the poorest sometimes scarcely L. 6. This scanty income is attended with many inconveniences. It obliges the clergy who have families to follow some branch of traffic, to the neglect of their ecclesiastical studies, and to the degradation of the professional character. Another inconvenience is superadded to the narrowness of their income. In most communities the ministers, though confirmed by the synod, are chosen by the people of the parish, and are solely dependent on their bounty. For these reasons, the candidates for holy orders are generally extremely ignorant. They cannot support that expence which is requisite to pursue their studies; they are not animated with the expectation of a decent competence; and, from the dependent mode of their election, are not encouraged to deserve their promotion by a consistent dignity of character.

GRIST, in country affairs, denotes corn ground, or ready for grinding.

GRIT (argillaceous), a genus of argillaceous earths. Its texture is more or less porous, equable, and rough to the touch. It does not give fire with steel, nor effervesce with acids. When fresh broken and breathed upon, it exhales an earthy smell. Mr Kirwan mentions two kinds; one from Hollington near Utoxeter, of a yellowish or whitish grey, and about the specific gravity of 2288. Another, from Kneperly in Staffordshire, is of the specific gravity of 2568; and so unfusible as to be used for fire stones. According to Fabroni the grit-stone is of greater or less hardness, mostly of a grey, and sometimes of a yellowish colour, composed of a siliceous and micaceous sand, but rarely of a sparry kind; with greater or smaller particles closely compacted by an argillaceous cement. It gives some sparks with steel, is indissoluble for the most part in acids, and vitrifiable in a strong fire. It is used for millstones and whetstones; and sometimes for filtering stones and for building.

GROAT, an English money of account, equal to four pence. Other nations, as the Dutch, Polanders, Saxons, Bohemians, French, &c. have likewise their groats, groots, groches, gros, &c. In the Saxon times, no silver coin bigger than a penny was struck in England, nor after the conquest, till Edward III. who, about the year 1351, coined grosses, i. e. *groats*, or great pieces, which went for 4d. a-piece: and so the matter stood till the reign of Henry VIII. who, in 1504, first coined shillings.

GROATS, in country affairs, oats after the hulls are off, or great oat-meal.

GROCERS, anciently were such persons as engrossed all merchandize that was vendible; but now they are incorporated, and make one of the companies of the city of London, which deals in sugar, foreign fruits, spices, &c.

GROENLAND, or SPITZBERGEN. See GREENLAND.

GROGRAM, a kind of stuff made of silk and mohair.

GROIN, that part of the belly next the thigh.—In the Philosophical Transactions we have an account of a remarkable case, where a peg of wood was extracted from the groin of a young woman of 21, after it had remained 16 years in the stomach and intestines, having been accidentally swallowed when she was about five years of age. *Vide* Vol. LXVII. p. 459.

GROIN, among builders, is the angular curve made by the intersection of two semi-cylinders or arches; and is either regular or irregular.—A *regular* groin is when the intersecting arches, whether semicircular or semielliptical, are of the same diameters and heights. An *irregular* groin is where one of the arches is semicircular and the other semielliptical.

GROMWELL, in botany. See LITHOSPERMUM.

GRONINGEN, the most northerly of the Seven United Provinces, is bounded on the north by the German ocean; on the south, by the county of Drenthe; on the east, by the bishopric of Munster, and the principality of East-Friesland; and on the west by the province of Friesland, from which it is parted by the river Lawers. Its greatest length from south-east to north-west is about 47 miles; but its breadth is very unequal, the greatest being about 33 miles. Here are rich pastures, large herds of great and small cattle, plenty of sea and river fish, and of turf, with some forests and corn-land. There are several rivers in the province, of which the principal is the Hunse; and a great number of canals and dykes. The states consist of the deputies of the town of Groningen, and the Ommeland, or circumjacent country; and hold their assemblies always in the town of Groningen. The province had anciently governors, under the title of *burggraves*; but their power being limited, the people enjoyed great privileges. Afterwards it became subject to the bishop of Utrecht; but shook off his yoke at last, and recovered its liberty. In 1536 it submitted to Charles V. and in 1579 acceded to the union of Utrecht. The colleges are much the same here as in the other provinces, viz. the provincial states, council of state, provincial tribunal, and chamber of accounts. Six deputies are sent from hence to the states-general. Of the established clergy there are 160 ministers, which form seven classes, whose annual synod is held, by turns, at Groningen and Appingedam.

GRONINGEN, the capital of the province of that name, is situated about 12 miles from the nearest shore of the German ocean, at the conflux of several rivulets, which form the Hunse and Fivel. Ships of considerable burden can come up to the city, in consequence of which it enjoys a pretty good trade. It was formerly very strong, but its fortifications are now much neglected.

The

||
Groove.

The university here was founded in 1615, and is well endowed out of the revenues of the ancient monasteries. The town, which was formerly one of the Hanse, and has still great privileges, is large and populous, being the seat of the high colleges, and containing three spacious market-places, and 27 streets, in which are many fine houses, besides churches and other public structures. By the river Fivel and the Eems, it has a communication with Westphalia. In 1672 it made such a gallant resistance against the bishop of Munster, that he is said to have lost 10,000 men before it. Rodolphus Agricola and Veselius, two of the most learned men of the age in which they lived, were born here. Under the jurisdiction of this city is a considerable district, called the *Gerecht*. E. Long. 6. 25. N. Lat. 53. 10.

GRONOVIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. There are five petals and stamina inserted into a campanulated calyx; the berry is dry, monospermous, and inferior.

GRONOVIVS (John Frederic), a very learned critic, was born at Hamburg in 1613; and having travelled through Germany, Italy, and France, was made professor of polite learning at Deventer, and afterwards at Leyden, where he died in 1671. He published, 1. *Diatriba in Statii*, &c. 2. *De festiis*. 3. Correct editions of Seneca, Statius, T. Livy, Pliny's Natural History, Tacitus, Aulus Gellius, Phædrus's Fables, &c. with notes; and other works.

GRONOVIVS (James), son of the preceding, and a very learned man, was educated first at Leyden, then went over to England, where he visited the universities, consulted the curious MSS. and formed an acquaintance with several learned men. He was chosen by the grand duke to be professor at Pisa, with a considerable stipend. He returned into Holland, after he had resided two years in Tuscany, and consulted the MSS. in the Medicean library. In 1679, he was invited by the curators of the university to a professorship; and his inaugural dissertation was so highly approved of, that the curators added 400 florins to his stipend, and this augmentation continued to his death in 1716. He refused several honourable and advantageous offers. His principal works are, *The treasure of Greek antiquities*, in 13 vols. folio; and a great number of dissertations, and editions of ancient authors. He was compared to Schioppus for the virulence of his style; and the severity with which he treated other great men who differed from him, exposed him to just censure.

GROOM, a name particularly applied to several superior officers belonging to the king's household, as groom of the chamber, groom of the stole. See STOLE, and WARDROBE.

GROOM is more particularly used for a servant appointed to attend on horses in the stable.—The word is formed from the Flemish *grom*, "a boy."

GROOVE, among miners, is the shaft or pit sunk into the earth, sometimes in the vein, and sometimes not.

GROOVE, among joiners, the channel made by their plough in the edge of a moulding, style, or rail, to put their pannels in, in wainscoting.

N^o 144.

GROSS, a foreign money, in divers countries, answering to our groat.

GROSS is used among us for the quantity of twelve dozen.

Gross weight, is the weight of merchandizes and goods, with their dust and dross, as also of the bag, cask, chest, &c. wherein they are contained; out of which gross weight, allowance is to be made of tare and tret.

GROSS, or GROSSUS, in our ancient law writers, denote a thing absolute, and not depending on another. Thus, *villain in gross*, *villanus in grosso*, was a servant, who did not belong to the land, but immediately to the person of the lord; or a servile person not appendant or annexed to the land or manor, and to go along with the tenures as appurtenant to it; but like other personal goods and chattels of his lord, at his lord's pleasure and disposal.

GROSS, *advowson in*. See ADVOWSON.

GROSS-BEAN, in zoology, a name by which we commonly call the *coccothraustes*, called also at other times the *haw-finch*. This is the *LOXIA coccothraustes* in the Linnæan system.

GROSS-BEAK, in ornithology; a species of *LOXIA*.

GROSSULARIA. See RIBES.

GROTESQUE, or GROTESK, in sculpture and painting, something whimsical, extravagant, and monstrous; consisting either of things that are merely imaginary, and have no existence in nature; or of things so distorted, as to raise surprise and ridicule. The name arises hence, that figures of this kind were anciently much used to adorn the *grottoes* wherein the tombs of eminent persons or families were inclosed. Such was that of Ovid, whose grotto was discovered near Rome about one hundred years ago.

GROTIUS (Hugo), or more properly HUGO DE GROOT, one of the greatest men in Europe, was born at Delft in 1583. He made so rapid a progress in his studies, that at the age of 15 he had attained a great knowledge in philosophy, divinity, and civil law; and a yet greater proficiency in polite literature, as appeared by the commentary he had made at that age on Martianus Capella. In 1598, he accompanied the Dutch ambassador into France, and was honoured with several marks of esteem by Henry IV. He took his degree of doctor of laws in that kingdom; and at his return to his native country, devoted himself to the bar, and pleaded before he was 17 years of age. He was not 24 when he was appointed attorney-general. In 1613 he settled in Rotterdam, and was nominated syndic of that city; but did not accept of the office, till a promise was made him that he should not be removed from it. This prudent precaution he took from his foreseeing, that the quarrels of the divines on the doctrine of grace, which had already given rise to many factions in the state, would occasion revolutions in the chief cities. The same year he was sent into England, on account of the divisions that reigned between the traders of the two nations, on the right of fishing in the northern seas; but he could obtain no satisfaction. He was afterwards sent to England, as it is thought, to persuade the king and the principal divines to favour the Arminians; and he had several conferences with King James on that subject. On his return to Holland, his attachment to Barneveldt involved

Gross

||

Grotius.

Grotius
||
Grotto.

involved him in great trouble; for he was seized, and sentenced to perpetual imprisonment in 1619, and to forfeit all his goods and chattels. But after having been treated with great rigour for above a year and a half in his confinement, he was delivered by the advice and artifice of his wife, who having observed that his keepers had often fatigued themselves with searching and examining a great trunk-full of foul linen which used to be washed at Gorkum, but now let it pass without opening it, she advised him to bore holes in it to prevent his being stifled, and then to get into it. He complied with this advice, and was carried to a friend's house in Gorkum; where dressing himself like a mason, and taking a rule and trowel, he passed through the market-place, and stepping into a boat went to Valvet in Brabant. Here he made himself known to some Arminians, and hired a carriage to Antwerp. At first there was a design of prosecuting his wife, who staid in the prison; and some judges were of opinion that she ought to be kept there in her husband's stead: however, she was released by a plurality of voices, and universally applauded for her behaviour. He now retired into France, where he met with a gracious reception from that court, and Louis XIII. settled a pension upon him. Having resided there eleven years, he returned to Holland, on his receiving a very kind letter from Frederic Henry prince of Orange: but his enemies renewing their persecution, he went to Hamburgh; where, in 1634, Queen Christina of Sweden made him her counsellor, and sent him ambassador into France. After having discharged the duties of this office above eleven years, he returned, in order to give an account to Queen Christina of his embassy; when he took Holland in his way, and received many honours at Amsterdam. He was introduced to her Swedish majesty at Stockholm; and there begged that she would grant his dismissal, in order that he might return to Holland. This he obtained with difficulty; and the queen gave him many marks of her esteem, though he had many enemies at this court. As he was returning, the ship in which he embarked was cast away on the coast of Pomerania; and being now sick, he continued his journey by land; but was forced to stop at Rostock, where he died, on the 28th of August 1645. His body was carried to Delft, to be interred in the sepulchre of his ancestors. Notwithstanding the embassies in which he was employed, he composed a great number of excellent works; the principal of which are, 1. A treatise *De jure belli et pacis*, which is esteemed a master-piece. 2. A treatise on the truth of the Christian religion. 3. Commentaries on the holy scriptures. 4. The history and annals of Holland. 5. A great number of letters. All which are written in Latin.

GROTSCAW, a town of Turkey in Europe, in the province of Servia, where a battle was fought between the Germans and Turks, in the year 1739, in which the Germans were forced to retreat with loss. E. Long. 21. 0. N. Lat. 45. 0.

GROTSKAW, a strong town of Germany, capital of a province of the same name in Silesia. It is very agreeably seated in a fruitful plain. E. Long. 17. 35. N. Lat. 50. 42.

GROTTO, or GROTTA, a large deep cavern or

den in a mountain or rock. The word is Italian, *grotta*, formed, according to Menage, &c. from the Latin *crypta*. Du Cange observes, that *grotta* was used in the same sense in the corrupt Latin.

The ancient anchorites retired into dens and grottos, to apply themselves the more attentively to meditation.

Okey-hole, Elden-hole, Peake's hole, and Pool's hole, are famous among the natural caverns or grottos of our country.

The entrance to Okey-hole, on the south side of Mendip-hills, is in the fall of those hills, which is beset all about with rocks, and has near it a precipitate descent of near twelve fathoms deep, at the bottom of which there continually issues from the rocks a considerable current of water. The naked rocks above the entrance show themselves about 30 fathoms high, and the whole ascent of the hill above is about a mile, and is very steep. As you pass into this vault, you go at first upon a level, but advancing farther, the way is found to be rocky and uneven, sometimes ascending, and sometimes descending. The roof of this cavern, in the highest part, is about eight fathoms from the ground, but in many particular places it is so low, that a man must stoop to get along. The breadth is not less various than the height, for in some places it is five or six fathoms wide, and in others not more than one or two. It extends itself in length about two hundred yards. People talk much of certain stones in it, resembling men and women, and other things; but there is little matter of curiosity in these, being only shapeless lumps of a common spar. At the farthest part of the cavern there is a good stream of water, large enough to drive a mill, which passes all along one side of the cavern, and at length slides down about six or eight fathoms among the rocks, and then pressing through the clefts of them, discharges itself into the valley. The river within the cavern is well stored with eels, and has some trouts in it; and these cannot have come from without, there being so great a fall near the entrance. In dry summers, a great number of frogs are seen all along this cavern, even to the farthest part of it; and on the roof of it, at certain places, hang vast numbers of bats, as they do in almost all caverns, the entrance of which is either level, or but slightly ascending or descending; and even in the more perpendicular ones they are sometimes found, provided they are not too narrow, and are sufficiently high. The cattle that feed in the pastures through which this river runs, have been known to die suddenly sometimes after a flood; this is probably owing to the waters having been impregnated, either naturally or accidentally, with lead-ore.

Elden-hole is a huge profound perpendicular chasm, three miles from Buxton, ranked among the natural wonders of the Peak. Its depth is unknown, and is pretended to be unfathomable. Cotton tells us he sounded 884 yards; yet the plummet still drew. But he might easily be deceived, unless his plummet was very heavy; the weight of a rope of that length might well make the landing of the plummet scarce perceivable.

Peak's-hole, and Pool's-hole, called also *the Devil's A-se*, are two remarkable horizontal springs under mountains; the one near Castleton, the other just by Buxton. They seem to have owed their origin to the

T

springs

Grotto.

Grotto. springs which have their current through them; when the water had forced its way through the horizontal fissures of the strata, and had carried the loose earth away with it, the loose stones must fall down of course: and where the strata had few or no fissures, they remained entire; and so formed these very irregular arches, which are now so much wondered at. The water which passes through Pool's-hole is impregnated with particles of lime-stone, and has incrusting the whole cavern in such a manner that it appears as one solid rock.

In grottos are frequently found crystals of the rock, stalactites, and other natural conglaciations, and those often of an amazing beauty. M. Homberg conjectures, from several circumstances, that the marble pillars in the grotto of Antiparos vegetate or grow. That author looks on this grotto as a garden, whereof the pieces of marble are the plants; and endeavours to show, that they could only be produced by some vegetative principle. See ANTIPAROS.

At Foligno in Italy is another grotto, consisting of pillars and orders of architecture of marble, with their ornaments, &c. scarcely inferior to those of art; but they all grow downwards: so that if this too be a garden, the plants are turned upside down.

Grotto del Cani, a little cavern near Pozzuoli, four leagues from Naples, the steams whereof are of a mephitical or noxious quality; whence also it is called *bocca venenosa*, the poisonous mouth. See MEPHITIS.

"Two miles from Naples (says Dr Mead), just by the Lago de Agnano, is a celebrated mofeta, commonly called *la Grotta del Cani*, and equally destructive to all within the reach of its vapours. It is a small grotto about eight feet high, twelve long, and six broad; from the ground arises a thin, subtle, warm fume, visible enough to a discerning eye, which does not spring up in little parcels here and there, but in one continued stream, covering the whole surface of the bottom of the cave; having this remarkable difference from common vapours, that it does not like smoke disperse itself into the air, but quickly after its rise falls back again, and returns to the earth; the colour of the sides of the grotto being the measure of its ascent: for so far it is of a darkish-green, but higher only common earth. And as I myself found no inconveniency by standing in it, so no animal, if its head be above this mark, is the least injured. But when, as the manner is, a dog, or any other creature, is forcibly kept below it; or, by reason of its smallness, cannot hold its head above it, it presently loses all motion, falls down as dead, or in a swoon; the limbs convulsed and trembling, till at last no more signs of life appear than a very weak and almost insensible beating of the heart and arteries; which, if the animal be left a little longer, quickly ceases too, and then the case is irrecoverable; but if it be snatched out, and laid in the open air, it soon comes to life again, and sooner if thrown into the adjacent lake." The fumes of the grotto, the same author argues, are no real poison, but act chiefly by their gravity; else the creatures could not recover so soon, or if they did, some symptoms, as faintness, &c. would be the consequence of it. He adds, "that in creatures killed therewith, when dissected, no marks of infection appear; and that the attack proceeds from a want of air, by

which the circulation tends to an entire stoppage; and this so much the more, as the animal inspires a fluid of a quite different nature from the air, and so in no respect fit to supply its place. Taking the animal out, while yet alive, and throwing it into the neighbouring lake, it recovers: this is owing to the coldness of the water, which promotes the contraction of the fibres, and so assists the retarded circulation; the small portion of air which remains in the vesiculæ, after every expiration, may be sufficient to drive out the noxious fluid. After the same manner, cold water acts in a *deliquium animi*: the lake of Agnano has no greater virtue in it than others."

The steam arising in this grotto was for a long time reckoned to be of a poisonous nature, and thought to *suffocate* the animals which breathed it. Dr Hales imagined that it destroyed the elasticity of the air, caused the vesicles of the lungs to collapse, and thus occasioned sudden death.—It is now, however, found that this steam is nothing else than fixed air, which from time immemorial hath issued out of the earth in that place in very great quantity, the causes of which cannot yet be investigated from any of the modern discoveries concerning that species of air. It proves pernicious when breathed in too great quantity, by rarefying the blood too much; and hence the best method of recovering persons apparently killed by fixed air, is to apply a great degree of cold all over their bodies, in order to condense the blood as much as possible. This is the reason why the dogs recover when thrown into the lake Agnano, as above mentioned. See the articles BLOOD and DAMPS.

Grotta del Serpi, is a subterraneous cavern near the village of Sassa, eight miles from the city of Bracciano in Italy, described by Kircher thus: "The *grotta del serpi* is big enough to hold two persons. It is perforated with several fistular apertures, somewhat in manner of a sieve; out of which, at the beginning of the spring season, issues a numerous brood of young snakes of divers colours, but all free from any particular poisonous quality. In this cave they expose their lepers, paralytics, arthritics, and elephantiac patients, quite naked; where, the warmth of the subterraneous steams resolving them into a sweat, and the serpents clinging variously all around, licking and sucking them, they become so thoroughly freed of all their vitious humours, that, upon repeating the operation for some time, they become perfectly restored."

This cave Kircher visited himself; and found it warm, and every way agreeable to the description given of it. He saw the holes, and heard a murmuring hissing noise in them. Though he missed seeing the serpents, it not being the season of their creeping out; yet he saw a great number of their exuviae, or sloughs, and an elm growing hard by laden with them.

The discovery of this cave was by the cure of a *Museum Worm*. leper going from Rome to some baths near this place. Losing his way, and being benighted, he happened upon this cave. Finding it very warm, he pulled off his clothes; and being weary and sleepy, had the good fortune not to feel the serpents about him till they had wrought his cure.

Milky Grotto, *Crypta Lactea*, a mile distant from the

Grotto.

Grotto,
Grove.

the ancient village of Bethlehem, is said to have been thus denominated on occasion of the blessed Virgin, who let fall some drops of milk in giving suck to Jesus in this grotto. And hence it has been commonly supposed, that the earth of this cavern has the virtue of restoring milk to women that are grown dry, and even of curing fevers. Accordingly, they are always digging in it, and the earth is sold at a good rate to such as have faith enough to give credit to the fable. An altar has been built on the place, and a church just by it.

GROTTO is also used for a little artificial edifice made in a garden, in imitation of a natural grotto. The outides of these grottos are usually adorned with rustic architecture, and their inside with shell-work, fossils, &c. finished likewise with jets d'eau or fountains, &c.

A cement for artificial grottos may be made thus: Take two parts of white rosin, melt it clear, and add to it four parts of bees wax; when melted together, add two or three parts of the powder of the stone you design to cement, or so much as will give the cement the colour of the stone; to this add one part of flower of sulphur: incorporate all together over a gentle fire, and afterwards knead them with your hands in warm water. With this cement the stones, shells, &c. after being well dried before the fire, may be cemented.

Artificial red coral branches, for the embellishment of grottos, may be made in the following manner: Take clear rosin, dissolve it in a brass-pan; to every ounce of which add two drams of the finest vermilion: when you have stirred them well together, and have chosen your twigs and branches, peeled and dried, take a pencil and paint the branches all over whilst the composition is warm; afterwards shape them in imitation of natural coral. This done, hold the branches over a gentle coal-fire, till all is smooth and even as if polished. In the same manner white coral may be prepared with white lead, and black coral with lamp-black.

A grotto may be built with little expence, of glass, cinders, pebbles, pieces of large flint, shells, moss, stones, counterfeit coral, pieces of chalk, &c. all bound or cemented together with the above described cement.

GROVE, in gardening, a small wood impervious to the rays of the sun.

GROVES have been in all ages held in great veneration. The *proseuchæ*, and high-places of the Jews, whither they resorted for the purposes of devotion, were probably situated in groves: See Joshua xxiv. 26. The *proseuchæ* in Alexandria, mentioned by Philo, had groves about them, because he complains that the Alexandrians, in a tumult against the Jews, cut down the trees of their *proseuchæ*.

The ancient Romans had a sort of groves near several of their temples, which were consecrated to some god, and called *luci*, by Antiphrasis, a *non lucendo*, as being shady and dark. The veneration which the ancient druids had for groves is well known.

Modern groves are not only great ornaments to gardens; but are also the greatest relief against the violent heats of the sun, affording shade to walk under in the hottest parts of the day, when the other parts

of the garden are useless; so that every garden is defective which has not shade.

Groves are of two sorts, *viz.* either open or close. Open groves are such as have large shady trees, which stand at such distances, as that their branches approach so near to each other as to prevent the rays of the sun from penetrating through them.

Close groves have frequently large trees standing in them; but the ground under these are filled with shrubs or underwood: so that the walks which are in them are private, and screened from winds; by which means they are rendered agreeable for walking, at those times when the air is either too hot or too cold in the more exposed parts of the garden. These are often contrived so as to bound the open groves, and frequently to hide the walls or other inclosures of the garden: and when they are properly laid out, with dry walks winding through them, and on the sides of these sweet-smelling shrubs and flowers irregularly planted, they have a charming effect.

GROVE (Henry), a learned and ingenious Presbyterian divine, was born at Taunton in Somersetshire, in 1683. Having obtained a sufficient stock of classical literature, he went through a course of academical learning, under the reverend Mr Warren of Taunton, who had a flourishing academy. He then removed to London, and studied some time under the reverend Mr Rowe, to whom he was nearly related. Here he contracted a friendship with several persons of merit, and particularly with Dr Watts, which continued till his death, though they were of different opinions in several points warmly controverted among divines. After two years spent under Mr Rowe, he returned into the country, and began to preach with great reputation; when an exact judgment, a lively imagination, and a rational and amiable representation of Christianity, delivered in a sweet and well governed voice, rendered him generally admired; and the spirit of devotion which prevailed in his sermons procured him the esteem and friendship of Mrs Singer, afterwards Mrs Row, which she expressed in a fine ode on death, addressed to Mr Grove. Soon after his beginning to preach, he married; and on the death of Mr Warren, was chosen to succeed him in the academy at Taunton. This obliging him to reside there, he preached for 18 years to two small congregations in the neighbourhood; and though his salary from both was less than twenty pounds a-year, and he had a growing family, he went through it cheerfully. In 1708, he published a piece, intitled, *The Regulation of Diversions*, drawn up for the use of his pupils. About the same time, he entered into a private dispute by letter with Dr Samuel Clarke: but they not being able to convince each other, the debate was dropped with expressions of great mutual esteem. He next wrote several papers printed in the *Spectator*, *viz.* Numbers 588. 601. 626. 635. The last was republished, by the direction of Dr Gibson bishop of London, in the *Evidences of the Christian Religion*, by Joseph Addison, Esq. In 1725, Mr James, his partner in the academy, dying, he succeeded him in his pastoral charge at Fulwood, near Taunton, and engaged his nephew to undertake the other parts of Mr James's work as tutor; and in this situation Mr Grove continued till his death, which happened in 1738. His great concern

Grove.

Ground
||
Groups.

cern with his pupils, was to inspire and cherish in them a prevailing love of truth, virtue, liberty, and genuine religion, without violent attachments or prejudices in favour of any party of Christians. He represented truth and virtue in a most engaging light; and though his income, both as a tutor and a minister, was insufficient to support his family, without breaking into his paternal estate, he knew not how to refuse the call of charity. Besides the above pieces, he wrote, 1. An Essay towards a Demonstration of the Soul's Immortality. 2. An Essay on the Terms of Christian Communion. 3. The Evidence of our Saviour's Resurrection considered. 4. Some Thoughts concerning the Proof of a Future State from Reason. 5. A Discourse concerning the Nature and Design of the Lord's Supper. 6. Wisdom the first spring of Action in the Deity. 7. A Discourse on Saving Faith. 8. Miscellanies in prose and verse. 9. Many Sermons, &c. After his decease, his posthumous works were published by subscription, in four volumes octavo, with the names of near 700 subscribers, among whom were some of the best judges of merit in the established church.

GROUND, in painting, the surface upon which the figures and other objects are represented.

The ground is properly understood of such parts of the piece, as have nothing painted on them, but retain the original colour upon which the other colours are applied to make the representations.

A building is said to serve as a ground to a figure when the figure is painted on the building.

The ground behind a picture in miniature, is commonly blue or crimson, imitating a curtain of fatten or velvet.

GROUND, in etching, denotes a gummy composition smeared over the surface of the metal to be etched, to prevent the aquafortis from eating, except in such places where this ground is cut through with the point of a needle. See the article **ETCHING**.

GROUND-ANGLING, fishing under water without a float, only with a plumb of lead, or a bullet, placed about nine inches from the hook; which is better, because it will roll on the ground. This method of fishing is most proper in cold weather, when the fish swim very low.

The morning and evening are the chief seasons for the ground-line in fishing for trout; but if the day prove cloudy, or the water muddy, you may fish at ground all day.

GROUND-TACKLE, a ship's anchors, cables, &c. and in general whatever is necessary to make her ride safe at anchor.

GROUND-IVY, in botany. See **GLECHOMA**.

GROUND-PINE, in botany. See **TEUCRIUM**.

GROUNDSEL. See **SENECIO**.

GROUP, in painting and sculpture, is an assemblage of two or more figures of men, beasts, fruits, or the like, which have some apparent relation to each other. See **PAINTING**.—The word is formed of the Italian *gruppo*, a knot.

The **GROUPS**, a cluster of islands lately discovered in the South Sea. They lie in about S. Lat. 18. 12. and W. Long. 142. 42. They are long narrow slips of land, ranging in all directions, some of them ten miles or upwards in length, but not more than a quar-

ter of a mile broad. They abound in trees, particularly those of the cocoa-nut. They are inhabited by well-made people, of a brown complexion. Most of them carried in their hands a slender pole about 14 feet in length, pointed like a spear; they had likewise something shaped like a paddle, about four feet long. Their canoes were of different sizes, carrying from three to six or seven people, and some of them hoisted a sail.

GROUSE, or **GROUSE**. See **TETRAO**.

GROUTHEAD, or **GREATHED** (Robert), a learned and famous bishop of Lincoln, was born at Stow in Lincolnshire, or (according to others) at Stradbroke in Suffolk, in the latter part of the twelfth century. His parents were so poor, that when a boy he was reduced to do the meanest offices, and even to beg his bread; till the mayor of Lincoln, struck with his appearance and the quickness of his answers to certain questions, took him into his family, and put him to school. Here his ardent love of learning, and admirable capacity for acquiring it, soon appeared, and procured him many patrons, by whose assistance he was enabled to prosecute his studies, first at Cambridge, afterwards at Oxford, and at last at Paris. In these three famous seats of learning, he spent many years in the most indefatigable pursuit of knowledge, and became one of the best and most universal scholars of the age. He was a great master not only of the French and Latin, but also of the Greek and Hebrew languages, which was a very rare accomplishment in those times. We are assured by Roger Bacon, who was intimately acquainted with him, that he spent much of his time for almost forty years in the study of geometry, astronomy, optics, and other branches of mathematical learning, in all which he very much excelled. Theology was his favourite study, in which he read lectures at Oxford with great applause. In the mean time, he obtained several preferments in the church, and was at length elected and consecrated bishop of Lincoln, A. D. 1235. In this station he soon became very famous, by the purity of his manners, the popularity of his preaching, the vigour of his discipline, and the boldness with which he reprov'd the vices and opposed the arbitrary mandates of the court of Rome; of this last it may be proper to give one example. Pope Innocent IV. had granted to one of his own nephews named *Frederick*, who was but a child, a provision to the first canon's place in the church of Lincoln that should become vacant; and sent a bull to the archbishop of Canterbury, and Innocent, then papal legate in England, commanding them to see the provision made effectual; which they transmitted to the bishop of Lincoln. But that brave and virtuous prelate boldly refused to obey this unreasonable mandate, and sent an answer to the papal bull containing the following severe reproaches against his holiness for abusing his power: "If we except the sins of Lucifer and Antichrist, there neither is nor can be a greater crime, nor any thing more contrary to the doctrine of the gospel, or more odious and abominable in the sight of Jesus Christ, than to ruin and destroy the souls of men, by depriving them of the spiritual aid and ministry of their pastors. This crime is committed by those who command the benefices intended for the support of able pastors, to be bestowed on those who are incapable of per-

Grouse,
Grouthead.

Growth.

performing the duties of the pastoral office. It is impossible therefore that the holy apostolic see, which received its authority from the Lord Jesus Christ, for edification, and not for destruction, can be guilty of such a crime, or any thing approaching to such a crime, so hateful to God and so hurtful to men. For this would be a most manifest corruption and abuse of its authority, which would forfeit all its glory, and plunge it into the pains of hell." Upon hearing this letter, his holiness became frantic with rage, poured forth a torrent of abuse against the good bishop, and threatened to make him an object of terror and astonishment to the whole world. "How dare (said he) this old, deaf, doating fool, disobey my commands? Is not his master the king of England my subject, or rather my slave? Cannot he cast him into prison, and crush him in a moment?" But the cardinals by degrees brought the pope to think more calmly, and to take no notice of this letter. "Let us not (said they) raise a tumult in the church without necessity, and precipitate that revolt and separation from us, which we know must one day take place." Remarkable words, when we reflect when and by whom they were spoken! The bishop did not long survive this noble stand against the gross corruptions and tyranny of the church of Rome: for he fell sick at his castle of Bugden that same year; and when he became sensible that his death was drawing near, he called his clergy into his apartment, and made a long discourse to them, to prove that the reigning pope Innocent IV. was Antichrist. With this exertion his strength and spirits were so much exhausted, that he expired soon after, October 9. 1253. A contemporary historian, who was perfectly well acquainted with him, hath drawn his character in the following manner. "He was a free and bold reprimander of the pope and the king; an admonisher of the prelates; a corrector of the monks; an instructor of the clergy; a supporter of the studious; a censurer of the incontinent; a scourge and terror to the court of Rome; a diligent searcher of the scriptures; and a frequent preacher to the people. At his table he was hospitable, polite, and cheerful. In the church he was contrite, devout, and solemn; and in performing all the duties of his office he was venerable, active, and indefatigable. The illustrious Roger Bacon, who was most capable, and had the best opportunities of forming a true judgment of the extent of his learning, by perusing his works, and by frequently conversing with him, hath given this honourable testimony in his favour. "Robert Grouthead bishop of Lincoln, and his friend friar Adam de Marisco, are the two most learned men in the world, and excel all the rest of mankind both in divine and human knowledge." This most excellent and learned prelate was a very voluminous writer, and composed a prodigious number of treatises on a great variety of subjects in philosophy and divinity, a catalogue of which is given by Bale.

GROWTH, the gradual increase of bulk and stature that takes place in animals or vegetables, to a certain period.—The increase of bulk in such bodies as have no life, owing to fermentations excited in their substance, or to other causes, is called **EXPANSION**, **SWELLING**, &c.

The growth of animals, nay even of the human spe-

cies, is subject to great variations. A remarkable instance in the last was observed in France in the year 1729. At this time the Academy of Sciences examined a boy who was then only seven years old, and who measured four feet eight inches and four lines high without his shoes. His mother observed the signs of puberty on him at two years old, which continued to increase very quick, and soon arrived at the usual standard. At four years old he was able to lift and toss the common bundles of hay in stables into the horses racks; and at six years old could lift as much as a sturdy fellow of twenty. But though he thus increased in bodily strength, his understanding was no greater than is usual with children of his age, and their playthings were also his favourite amusements.

Another boy, a native of the hamlet of Bouzanquet, in the diocese of Alais, though of a strong constitution, appeared to be knit and stiff in his joints till he was about four years and a half old. During this time nothing farther was remarkable of him than an extraordinary appetite, which was satisfied no otherwise than by giving him plenty of the common aliments of the inhabitants of the country, consisting of rye-bread, chesnuts, bacon, and water; but his limbs soon becoming supple and pliable, and his body beginning to expand itself, he grew up in so extraordinary a manner, that at the age of five years he measured four feet three inches; some months after, he was four feet eleven inches; and at six, five feet, and bulky in proportion. His growth was so rapid, that one might fancy he saw him grow: every month, his cloaths required to be made longer and wider; and what was still very extraordinary in his growth, it was not preceded by any sickness, nor accompanied with any pain in the groin or elsewhere. At the age of five years his voice changed, his beard began to appear, and at six he had as much as a man of thirty; in short, all the unquestionable marks of puberty were visible in him. It was not doubted in the country but this child was, at five years old, or five and a half, in a condition of begetting other children; which induced the rector of the parish to recommend to his mother that she would keep him from too familiar a conversation with children of the other sex. Though his wit was riper than is commonly observable at the age of five or six years, yet its progress was not in proportion to that of his body. His air and manner still retained something childish, though by his bulk and stature he resembled a complete man, which at first sight produced a very singular contrast. His voice was strong and manly, and his great strength rendered him already fit for the labours of the country. At the age of five years, he could carry to a good distance three measures of rye, weighing 84 pounds; when turned of six, he could lift up easily on his shoulders and carry loads of 150 pounds weight a good way off; and these exercises were exhibited by him as often as the curious engaged him thereto by some liberality. Such beginnings made people think that he would soon shoot up into a giant. A mountebank was already soliciting his parents for him, and flattering them with hopes of putting him in a way of making a great fortune. But all these hopes suddenly vanished. His legs became crooked, his body shrunk, his strength diminished, his voice grew sensibly

Growth.

Grub
||
Gruppo.

sibly weaker, and he at last sunk into a total imbecillity.

In the Paris Memoirs also there is an account of a girl who had her menses at three months of age. When four years old, she was four feet six inches in height, and had her limbs well proportioned to that height, her breasts large and plump, and the parts of generation like those of a girl of eighteen; so that there is no doubt but that she was marriageable at that time, and capable of being a mother of children. These things are more singular and marvellous in the northern than in the southern climates, where the females come sooner to maturity. In some places of the East Indies, the girls have children at nine years of age.

Many other instances of extraordinary growth might be brought, but the particulars are not remarkably different from those already related.—It is at first sight astonishing that children of such early and prodigious growth do not become giants: but when we consider, that the signs of puberty appear so much sooner than they ought, it seems evident that the whole is only a more than usually rapid expansion of the parts, as in hot climates; and accordingly it is observed, that such children, instead of becoming giants, always decay and die apparently of old age, long before the natural term of human life.

GRUB, in zoology, the English name of the hexapode worms, produced from the eggs of beetles, and which at length are transformed into winged insects of the same species with their parents.

GRUBBING, in agriculture, the digging or pulling up of the stubs and roots of trees.

When the roots are large, this is a very troublesome and laborious task; but Mr Mortimer hath shown how it may be accomplished in such a manner as to save great expence by a very simple and easy method. He proposes a strong iron hook to be made about two feet four inches long, with a large iron-ring fastened to the upper part of it. This hook must be put into a hole in the side of the root, to which it must be fastened; and a lever being put into the ring, three men, by means of this lever, may wring out the root, and twist the sap-roots asunder. Stubs of trees may also be taken up with the same hook, in which work it will save a great deal of labour, though not so much as in the other; because the stubs must be first cleft with wedges, before the hook can enter the sides of them, to wrench them out by pieces.

GRUBENHAGEN, a town and castle of the duchy of Brunswick, in Lower Saxony, remarkable for its mines of silver, copper, iron, and lead. E. Long. 9. 36. N. Lat. 51. 45.

GRUINALES (from *grus*, “a crane”), the name of the fourteenth order in Linnæus’s Fragments of a Natural Method, consisting of geranium, and a few other genera which the author considers as allied to it in their habit and external structure.

GRUME, in medicine, denotes a concreted clot of blood, milk, or other substance. Hence grumous blood is that which approaches to the nature of grume, and by its viscosity and stagnating in the capillary vessels produces several disorders.

GRUPPO, or Turned SHAKE, a musical grace, de-

finied by Playford to consist in the alternate prolation of two tones in juxtaposition to each other, with a close on the note immediately beneath the lower of them. See SHAKE.

GRUS, in antiquity, a dance performed yearly by the young Athenians around the temple of Apollo, on the day of the Delia. The motions and figures of this dance were very intricate, and variously interwoven; some of them being intended to express the windings of the labyrinth wherein the minotaur was killed by Theseus.

GRUS, in astronomy, a southern constellation, not visible in our latitude. The number of stars in this constellation, according to Mr Sharp’s Catalogue, is 13.

GRUS, in ornithology. See ARDEA.

GRUTER (James), a learned philologer, and one of the most laborious writers of his time, was born at Antwerp in 1560. He was but a child when his father and mother, being persecuted for the Protestant religion by the dukes of Parma, governors of the Netherlands, carried him into England. He imbibed the elements of learning from his mother, who was one of the most learned women of the age, and besides French, Italian, and English, was a complete mistress of Latin, and well skilled in Greek. He spent some years in the university of Cambridge; after which he went to that of Leyden to study the civil law; but at last applied himself wholly to polite literature. After travelling much, he became professor in the university of Heidelberg; near which city he died, in 1627. He wrote many works; the most considerable of which are, 1. A large collection of ancient inscriptions. 2. *Thesaurus criticus*. 3. *Deliciae poetarum Gallorum, Italorum, & Belgarum, &c.*

GRUYERS, a town of Switzerland, in the canton of Friburgh, with a pretty good castle. It is famous for its cheese, which is all its riches. E. Long. 7. 23. N. Lat. 46. 35.

GRY, a measure containing one-tenth of a line.

A line is one-tenth of a digit, and a digit one-tenth of a foot, and a philosophical foot one-third of a pendulum, whose diadromes, or vibrations, in the latitude of 45 degrees, are each equal to one-second of time, or one-sixtieth of a minute.

GRYLLUS, in zoology, the name of the cricket and locust kinds, which, together with the grasshoppers, make only one genus of insects, belonging to the order of hemiptera. The general characters of the genus are these: The head is inflected, armed with jaws, and furnished with palpi: The antennæ in some of the species are setaceous, in others filiform: The wings are deflected towards and wrapped round the sides of the body; the under ones are folded up, so as to be concealed under the elytra. All the feet are armed with two nails; and the hind ones are formed for leaping. The genus is subdivided into five different sections, or families, as follows:

I. The ACRIDÆ, *Truxalides* of Fabricius, or CRICKET family properly so called; of which the characters are: Their head is of a conical form, and longer than the thorax; and their antennæ are ensiform, or sword-shaped. Of this family there are eight species, none of them found in Britain.

II. The BULLÆ, or *Acrydia* of Fabricius: These

Grus
||
Gryllus.

Gryllus.

are distinguished by a kind of crest or elevation on the thorax; their antennæ are shorter than the thorax, and filiform; and their palpi are equal.—The gryllus bulla-bipunctatus is of a dark-brown colour; sometimes besprinkled with spots of a lighter hue. But the chief and most obvious distinction of this species is the form of its thorax, which is prolonged, covering the whole body, and decreases to the extremity of the abdomen. This prolongation of the thorax stands instead of elytra, of which this insect is destitute. It has only wings under this projection of the thorax. Linnaeus mentions a spot in the thorax; which, however, is often wanting. This species is every where to be met with, in the fields, in woods, &c. There are 10 or 11 other species, inhabitants of Europe and America.

III. The third family, called *ACHETÆ*, are distinguished by two bristles, situated above the extremity of their abdomen; by having three stemmata; and by the tarsi being composed of three articulations. This family is in many places called *Cricket*, on account of the sound which the insect makes. There are 28 species enumerated in the new edition of the *Système Nature*; of which the most remarkable are,

1. The gryllus *domesticus*, or the *domesticus* and *campestris*, the domestic and the field gryllus being one and the same species; only that the former is paler and has more of the yellow cast, and the latter more of a brown. The antennæ are as slender as a thread, and nearly equal to the body in length. The head is large, and round, with two large eyes, and three smaller ones of a light yellow colour, placed higher on the edge of the depression, from the centre of which originate the antennæ: The thorax is broad and short. In the *males*, the elytra are longer than the body, veined, as it were rumpled on the upper part, crossed one over the other, and enfolding part of the abdomen, with a projecting angle on the sides: They have also at their base a pale-coloured band. In the *females*, the elytra leave one-third of the abdomen uncovered, and scarcely cross each other; and they are all over of one colour, veined and not rumpled; nor do they wrap round so much of the abdomen underneath. The female, moreover, carries at the extremity of its body a hard spine, almost as long as the abdomen, thicker at the end, composed of two sheaths, which encompass two laminæ: This implement serves the insect to sink and deposit its eggs in the ground. Both the male and female have two pointed soft appendices at the extremity of the abdomen. Their hinder feet are much larger and longer than the rest, and serve them for leaping.

Towards sunset is the time the *field gryllus*, or *cricket* as it often called, likes best to appear out of its subterraneous habitation. In White's *Natural History of Selbourne* †, a very pleasing account is given of the manners and economy of these insects; which, however, are so shy and cautious, he observes, that it is no easy matter to get a sight of them; for, feeling a person's footsteps as he advances, they stop short in the midst of their song, and retire backward nimbly into their burrows, where they lurk till all suspicion of danger is over. At first it was attempted to dig them out with a spade, but without any great success; for either the bottom of the hole was inaccessible from its terminating under a great stone; or else, in breaking

Gryllus.

up the ground, the poor insect was inadvertently squeezed to death. Out of one so bruised a multitude of eggs were taken, which were long and narrow, of a yellow colour, and covered with a very tough skin. More gentle means were then used, and proved successful: "a pliant stalk of grass, gently insinuated into the caverns, will probe their windings to the bottom, and quickly bring out the inhabitant; and thus the humane inquirer may gratify his curiosity without injuring the object of it. It is remarkable, that though these insects are furnished with long legs behind, and brawny thighs for leaping, like grasshoppers; yet when driven from their holes they show no activity, but crawl along in a shiftless manner, so as easily to be taken: and again, tho' provided with a curious apparatus of wings, yet they never exert them when there seems to be the greatest occasion. The males only make that shrilling noise perhaps out of rivalry and emulation, as is the case with many animals which exert some sprightly note during their breeding time: it is raised by a brisk friction of one wing against the other. They are solitary beings, living singly male or female, each as it may happen; but there must be a time when the sexes have some intercourse, and then the wings may be useful perhaps during the hours of night. When the males meet they will fight fiercely, as our author found by some which he put into the crevices of a dry stone wall, where he wanted to have made them settle. For tho' they seemed distressed by being taken out of their knowledge, yet the first that got possession of the chinks would seize on any that were obtruded upon them with a vast row of serrated fangs. With their strong jaws, toothed like the shears of a lobster's claws, they perforate and round their curious regular cells, having no fore-claws to dig, like the mole-cricket. When taken in the hand, they never offered to defend themselves, though armed with such formidable weapons. Of such herbs as grow before the mouths of their burrows they eat indiscriminately; and on a little platform, which they make just by, they drop their dung; and never, in the day time, seem to stir more than two or three inches from home. Sitting in the entrance of their caverns they chirp all night as well as day from the middle of the month of May to the middle of July: in hot weather, when they are most vigorous, they make the hills echo; and in the stiller hours of darkness, may be heard to a considerable distance. In the beginning of the season their notes are more faint and inward; but become louder as the summer advances, and so die away again by degrees.—Sounds do not always give us pleasure according to their sweetness and melody; nor do harsh sounds always displease. We are more apt to be captivated or disgusted with the associations which they promote, than with the notes themselves. Thus the shrilling of the *field-cricket*, though sharp and stridulous, yet marvellously delights some hearers, filling their minds with a train of summer ideas of every thing that is rural, verdurous, and joyous. About the tenth of March the crickets appear at the mouths of their cells, which they then open and bore, and shape very elegantly. All that ever I have seen at that season were in their pupa state, and had only the rudiments of wings, lying under a skin or coat, which must be cast before the insect can arrive at its perfect state; from whence I should suppose that the

old.

Gryllus.

old ones of last year do not always survive the winter. In August their holes begin to be obliterated, and the insects are seen no more till spring.—Not many summers ago I endeavoured to transplant a colony to the terrace in my garden, by boring deep holes in the sloping turf. The new inhabitants staid some time, and fed and sung; but wandered away by degrees, and were heard at a farther distance every morning; so that it appears that on this emergency they made use of their wings in attempting to return to the spot from which they were taken.—One of these crickets, when confined in a paper cage and set in the sun, and supplied with plants moistened with water, will feed and thrive, and become so merry and loud as to be irksome in the same room where a person is sitting: if the plants are not wetted, it will die.”

The *domestic gryllus*, or hearth-cricket, as it is called, does not require it to be sought after abroad for examination, nor is shy like the other sort: it resides altogether within our dwellings, intruding itself upon our notice whether we will or no. It delights in new built houses; being, like the spider, pleased with the moisture of the walls; and besides, the softness of the mortar enables them to burrow and mine between the joints of the bricks or stones, and to open communications from one room to another. They are particularly fond of kitchens and bakers ovens, on account of their perpetual warmth. “Tender insects that live abroad either enjoy only the short period of one summer, or else doze away the cold uncomfortable months in profound slumbers; but these (our author observes), residing as it were in a torrid zone, are always alert and merry: a good Christmas fire is to them like the heats of the dog-days. Though they are frequently heard by day, yet is their natural time of motion only in the night. As soon as it grows dusk, the chirping increases, and they come running forth, and are from the size of a flea to that of their full stature. As one should suppose, from the burning atmosphere which they inhabit, they are a thirsty race, and show a great propensity for liquids, being found frequently drowned in pans of water, milk, broth, or the like. Whatever is moist they affect; and therefore often gnaw holes in wet woollen stockings and aprons that are hung to the fire. These crickets are not only very thirsty, but very voracious; for they will eat the scummings of pots; yeast, salt, and crumbs of bread; and any kitchen offal or sweepings. In the summer we have observed them to fly, when it became dusk, out of the windows, and over the neighbouring roofs. This feat of activity accounts for the sudden manner in which they often leave their haunts, as it does for the method by which they come to houses where they were not known before. It is remarkable, that many sorts of insects seem never to use their wings but when they have a mind to shift their quarters and settle new colonies. When in the air they move “*volatu undoso*,” in waves or curves, like wood-peckers, opening and shutting their wings at every stroke, and so are always rising or sinking.—When they increase to a great degree, as they did once in the house where I am now writing, they become noisome pests, flying into the candles, and dashing into people’s faces; but may be blasted by gunpowder discharged into their crevices and crannies. In families, at such times, they are, like

N^o 144.

Pharaoh’s plague of frogs,—‘in their bedchambers, and upon their beds, and in their ovens, and in their kneading-troughs.’ Their shrilling noise is occasioned by a brisk attrition of their wings. Cats catch hearth-crickets, and playing with them as they do with mice, devour them. Crickets may be destroyed, like wasps, by phials half filled with beer, or any liquid, and set in their haunts; for being always eager to drink, they will crowd in till the bottles are full.” A popular prejudice, however, frequently prevents their being driven away and destroyed: the common people imagine that their presence brings a kind of luck to the house while they are in it, and think it would be hazardous to destroy them.

2. *Gryllus gryllotalpa*, or mole cricket, is of a very unpleasant form. Its head, in proportion to the size of its body, is small and oblong, with four long thick palpi, and two long antennæ as slender as threads. Behind the antennæ are situated the eyes, and between those two eyes are seen three stemmata or lesser eyes, amounting to five in all, set in one line transversely. The thorax forms a kind of cuirass, oblong, almost cylindrical, which appears as it were velvety. The elytra, which are short, reach but to the middle of the abdomen, are crossed one over the other, and have large black or brown nervous fibres. The wings terminate in a point, longer not only than the elytra, but even than the abdomen. This latter is soft, and ends in two points or appendices of some length. But what constitutes the chief singularity of this insect are its fore-feet, that are very large and flat, with broad legs, ending outwardly in four large serrated claws, and inwardly in two only; between which claws is situated, and often concealed, the tarsus. The whole animal is of a brown dusky colour. It haunts moist meadows, and frequents the sides of ponds and banks of streams, performing all its functions in a swampy wet soil. With a pair of fore-feet curiously adapted to the purpose, it burrows and works under ground like the mole, raising a ridge as it proceeds, but seldom throwing up hillocks. As mole-crickets often infest gardens by the sides of canals, they are unwelcome guests to the gardener, raising up ridges in their subterraneous progress, and rendering the walks unsightly. If they take to the kitchen quarters, they occasion great damage among the plants and roots, by destroying whole beds of cabbages, young legumes, and flowers. When dug out they seem very slow and helpless, and make no use of their wings by day; but at night they come abroad, and make long excursions. In fine weather, about the middle of April, and just at the close of day, they begin to solace themselves with a low, dull, jarring note, continued for a long time without interruption, and not unlike the chattering of the fern-owl, or goat-sucker, but more inward. About the beginning of May they lay their eggs, as Mr White informs us, who was once an eye-witness: “for a gardener at an house where he was on a visit, happening to be mowing, on the 6th of that month, by the side of a canal, his scythe struck too deep, pared off a large piece of turf, and laid open to view a curious scene of domestic economy:

“ — — — ingentem lato dedit ore fenestram :

“ Apparet domus intus, et atria longa patefuit :

“ Apparent — — — penetralia.”

There

Gryllus. There were many caverns and winding passages leading to a kind of chamber, neatly smoothed and rounded, and about the size of a moderate snuff-box. Within this secret nursery were deposited near 100 eggs of a dirty yellow colour, and enveloped in a tough skin, but too lately excluded to contain any rudiments of young, being full of a viscous substance. The eggs lay but shallow, and within the influence of the sun, just under a little heap of fresh-mowed mould, like that which is raised by ants.—When mole-crickets fly, they move “*curfu undoso*,” rising and falling in curves, like the other species mentioned before. In different parts of this kingdom people call them *fen-crickets*, *churr-worms*, and *eve-churrs*, all very apposite names.”

IV. The *TETTIGONIÆ*, GRASSHOPPERS, or *Locusts* armed at the tail: The females of this family are distinguished by a tubular dart at the extremity of their abdomen: in both sexes the antennæ are setaceous, and longer than the abdomen; and the tarsi composed of four articulations. Of these insects there are 69 species enumerated in the *Systema Naturæ*. They leap by the help of their hinder legs, which are strong and much longer than the fore ones. Their walk is heavy, but they fly tolerably well. Their females deposit their eggs in the ground, by means of the appendices which they carry in their tail, which consist of two laminae, and penetrate the ground. They lay a great number of eggs at a time; and those eggs, united in a thin membrane, form a kind of group. The little larvæ that spring from them are wholly like the perfect insects, excepting in size, and their having neither wings nor elytra, but only a kind of knobs, four in number, which contain both, but undisplayed. The unfolding of them only takes place at the time of the metamorphosis, when the insect has attained its full growth. In these insects, when examined internally, besides the gullet, we discover a small stomach; and behind that, a very large one, wrinkled and furrowed within-side. Lower down, there is still a third: so that it is thought, and with some probability, that all the animals of this genus chew the cud, as they so much resemble ruminant animals in their internal conformation.

V. *LOCUSTÆ* (the *Grylli* of Fabricius), or *Locusts* unarmed at the tail. This family is distinguished by having the tail purple, without the setæ of the *Achetæ*, or the tube of the *Tettigoniæ*: their antennæ are filiform, and half shorter than the abdomen: they have three stemmata, and three joints to the tarsi. To part of this description, however, there is an exception in the *gryllus locusta grossus*, the antennæ of which are of a cylindrical form. According to Mr Barbutt, “few species vary so much in size and colours. Some of these insects are twice as long as others; the antennæ in most are filiform, but in this particular species cylindrical, composed of about 24 articulations, and but one fourth of the length of the body. As to colour, the small individuals are nearly quite red spotted with black, with the under part of the body only of a greenish yellow. The larger subjects are all over of a greenish hue, the under part being of a deeper yellow; only the inside of the hinder thighs is red. But what characterises this species is, the form of the thorax, which has, above, a longitudinal elevation, attended by one on each side, the middle whereof drawing nigh

to the first, forms a kind of X. Moreover, between the claws that terminate the feet there are small spunges, but larger in this species than the rest. This species is to be met with every where in the country. The larvæ or caterpillars very much resemble the perfect insects, and commonly dwell under ground.” Of this tribe, 118 other species are enumerated in the *Systema Naturæ*, natives of different parts of the globe; besides a considerable number noted as unascertained with regard to their being distinct species or only synonyms or varieties of some of the others.

All the *GRYLLI*, except the first family which feed upon other insects, live upon plants; the *achetæ* chiefly upon the roots, the *tettigoniæ* and *locustæ* upon the leaves.

The distinction of *Locusts* into families (IV. V.), as above characterised, is extremely proper; and the difference of organisation upon which it is founded has been observed to be adapted to the mode and the places in which the insects lay their eggs. But by taking the wings into consideration, there might have been formed three tribes or divisions, instead of two, upon the same natural foundation. Thus, according to the observations of the Abbé Pouet †, those which have their abdomen furnished with the tube or dart above mentioned, lay their eggs in a stiff sort of earth which that instrument perforates. During the operation, the dart opens; and, being hollow and grooved on each side within, the egg slides down along the grooves, and is deposited in the hole. Of those which have the tail simple, *i. e.* which have *no dart*, some have long wings, and some very short. The long-winged sort lay their eggs on the bare ground, and have no use for a perforating instrument; but they cover them with a glutinous substance, which fixes them to the soil, and prevents their being injured either by wind or wetness. Those, again, which have short wings deposit their eggs in the sand; and to make the holes for this purpose, they have the power of elongating and retracting their abdominal rings, and can turn their body as on a pivot; in which operation long wings would have been a material impediment.

The annals of most of the warm countries are filled with accounts of the devastations produced by locusts, who sometimes make their appearance in clouds of vast extent. They seldom visit Europe in such swarms as formerly; yet in the warmer parts of it are still formidable.—Those which have at uncertain intervals visited Europe in our memory, are supposed to have come from Africa: they are a large species about three inches long. The head and horns are of a brownish colour; it is blue about the mouth, as also on the inside of the larger legs. The shield which covers the back is greenish; and the upper side of the body brown, spotted black, and the under side purple. The upper wings are brown, with small dusky spots, and one larger spot at the tips. The under wings are more transparent, and of a light brown tinged with green, but there is a dark cloud of spots near the tips.—These insects are bred in the warm parts of Asia and Africa, from whence they have often taken their flight into Europe, where they committed terrible devastations. They multiply faster than any other animal in the creation, and are truly terrible in the countries where they breed. Some of them were seen in different

Gryllus.

Gryllus.

Gryllus.

parts of Britain in the year 1748, and great mischiefs were apprehended: but happily for us, the coldness of our climate, and the humidity of our soil, are very unfavourable to their production; so that, as they are only animals of a year's continuance, they all perish without leaving a young generation to succeed them.

When the locusts take the field, it is said they have a leader at their head, whose flight they observe, and pay a strict regard to all his motions. They appear at a distance like a black cloud, which, as it approaches, gathers upon the horizon, and almost hides the light of day. It often happens, that the husbandman sees this imminent calamity pass away without doing him any mischief; and the whole swarm proceeds onward to settle upon some less fortunate country. In those places, however, where they alight, they destroy every green thing, stripping the trees of their leaves, as well as devouring the corn and grass. In the tropical climates they are not so pernicious as in the more southern parts of Europe. In the first, the power of vegetation is so strong, that an interval of three or four days repairs the damage; but in Europe this cannot be done till next year. Besides, in their long flights to this part of the world, they are famished by the length of their journey, and are therefore more voracious wherever they happen to settle. But as much damage is occasioned by what they destroy, as by what they devour. Their bite is thought to contaminate the plant, and either to destroy or greatly to weaken its vegetation. To use the expression of the husbandmen, they burn wherever they touch, and leave the marks of their devastation for three or four years ensuing. When dead, they infect the air in such a manner that the stench is insupportable.—Orosius tells us, that in the year of the world 3800, Africa was infested with a multitude of locusts. After having eaten up every thing that was green, they flew off and were drowned in the sea; where they caused such a stench as could not have been equalled by the putrefying carcases of 100,000 men.

In the year 1650, a cloud of locusts was seen to enter Russia in three different places; and from thence they spread themselves over Poland and Lithuania in such astonishing multitudes, that the air was darkened and the earth covered with their numbers. In some places they were seen lying dead, heaped upon each other to the depth of four feet; in others, they covered the surface like a black cloth; the trees bent with their weight, and the damage which the country sustained exceeded computation.

In Barbary, their numbers are formidable; and Dr Shaw was a witness of their devastations there in 1724. Their first appearance was in the latter end of March, when the wind had been southerly for some time. In the beginning of April, their numbers were so vastly increased, that, in the heat of the day, they formed themselves into large swarms that appeared like clouds, and darkened the sun. In the middle of May they began to disappear, retiring into the plains to deposit their eggs. In June the young brood began to make their appearance, forming many compact bodies of several hundred yards square; which afterwards marching forward, climbed the trees, walls, and houses, eating every thing that was green in their way. The in-

habitants, to stop their progress, laid trenches all over their fields and gardens, which they filled with water. Some placed large quantities of heath, stubble, and such like combustible matter, in rows, and set them on fire on the approach of the locusts. But all this was to no purpose; for the trenches were quickly filled up, and the fires put out by the great numbers of swarms that succeeded each other. A day or two after one of these was in motion, others that were just hatched came to glean after them, gnawing off the young branches, and the very bark of the trees. Having lived near a month in this manner, they arrived at their full growth, and threw off their worm-like state, by casting their skins. To prepare themselves for this change, they fixed their hinder part to some bush or twig, or corner of a stone, when immediately, by an undulating motion used on this occasion, their heads would first appear, and soon after the rest of their bodies. The whole transformation was performed in seven or eight minutes time, after which they remained for a little while in a languishing condition; but as soon as the sun and air had hardened their wings, and dried up the moisture that remained after casting off their former sloughs, they returned to their former greediness, with an addition both of strength and agility. But they did not long continue in this state before they were entirely dispersed. After laying their eggs, they directed their course northward, and probably perished in the sea.—In that country, however, the amazing fertility of the soil and warmth of the climate generally render the depredations of these insects of little consequence; besides that many circumstances concur to diminish their number. Though naturally herbivorous, they often fight with each other, and the victor devours the vanquished. They are the prey, too, of serpents, lizards, frogs, and the carnivorous birds. They have been found in the stomachs of the eagle and different kinds of owls. They are also used as food by the Moors; who go to hunt them, fry them in oil or butter, and sell them publicly at Tunis and other places.

In 1754, 1755, 1756, and 1757, great devastations were committed in Spain by a species of locusts, of which we have the following description by Don Guillermo Bowles, published in *Dillon's Travels* thro' that country. "The locusts are continually seen in the southern parts of Spain, particularly in the pastures and remote uncultivated districts of Estremadura, but in general are not taken notice of, if not very numerous, as they commonly feed upon wild herbs, without preying upon gardens and cultivated lands, or making their way into houses. The peasants look at them with indifference while they are frisking about in the field, neglecting any measure to destroy them till the danger is immediate and the favourable moment to remedy the evil is elapsed. Their yearly number is not very considerable, as the males are far more numerous than the females. If an equal proportion were allowed only for ten years, their numbers would be so great as to destroy the whole vegetative system. Beasts and birds would starve for want of subsistence, and even mankind would become a prey to their ravenous appetites. In 1754, their increase was so great from the multitude of females, that all La Mancha and Portugal were covered with them and totally ravaged. The horrors of famine were spread even farther, and assailed

the

Gryllus.

the fruitful provinces of Andalusia, Murcia, and Valencia.

"The amours of these creatures are objects of surprise and astonishment, and their union is such that it is difficult to separate them. When this separation is voluntary, after having lasted some hours, they are so exhausted, that the male retires immediately to the water for refreshment, where, losing the use of his limbs, he soon perishes, and becomes an easy prey to the fish; having given life to his offspring at the expence of his own. The female, disembarassed, tho' not without violent struggles, spends the remainder of her days in some solitary place, busy in forming a retreat under ground, where she can secure her eggs, of which she generally lays about 40, screening them by her sagacity from the intemperature of the air, as well as the more immediate danger of the plough or the spade, one fatal blow of which would destroy all the hopes of a rising generation.

"The manner of her building this cell is equally surprising. In the hinder part of her body, nature has provided her with a round smooth instrument, eight lines in length, which at its head is as big as a writing quill, diminishing to a hard sharp point, hollow within like the tooth of a viper, but only to be seen with a lens. At the root of this vehicle there is a cavity, with a kind of bladder, containing a glutinous matter, of the same colour, but without the consistency or tenacity of that of the silk-worm, as I found by an experiment, made for the purpose, by an infusion in vinegar, for several days, without any effect. The orifice of the bladder corresponds exactly with the instrument which serves to eject the glutinous matter. It is hid under the skin of the belly, and its interior surface is united to the moveable parts of the belly, and can partake of its motions, forming the most admirable contexture for every part of its operations, as she can dispose of this ingredient at pleasure, and eject the fluid, which has three very essential properties: first, being indissoluble in water, it prevents its young from being drowned; next, it resists the heat of the sun, otherwise the structure would give way and destroy its inhabitants; lastly, it is proof against the frost of winter, so as to preserve a necessary warmth within. For greater security, this retreat is always contrived in a solitary place: for tho' a million of locusts were to light upon a cultivated field, not one would deposit her eggs there; but wherever they meet a barren and lonesome situation, there they are sure to repair and lay their eggs.

"These locusts seem to devour, not so much from a ravenous appetite, as from a rage of destroying every thing that comes in their way. It is not surprising, that they should be fond of the most juicy plants and fruits, such as melons, and all manner of garden fruits and herbs, and feed also upon aromatic plants, such as lavender, thyme, rosemary, &c. which are so common in Spain, that they serve to heat ovens: but it is very singular, that they equally eat mustard seed, onions, and garlic; nay even hemlock, and the most rank and poisonous plants, such as the thorn apple and deadly nightshade. They will even prey upon crowfoot, whose causticity burns the very hides of beasts; and such is their universal taste, that they do not prefer the innocent mallow to the bitter furze, or rue to worm-wood, consuming all alike, without predilection or favour, with this remarkable circumstance, that during

the four years they committed such havoc in Estremadura, the love-apple, or *lycopersicon solanum* of Linnæus, was the only plant that escaped their rapacious tooth, and claimed a respect to its root, leaves, flowers, and fruit. Naturalists may search for their motives, which I am at a loss to discover; the more as I saw millions of them light on a field near Almaden, and devour the woollen and linen garments of the peasants, which were lying to dry on the ground. The curate of the village, a man of veracity, at whose house I was, assured me, that a tremendous body of them entered the church, and devoured the silk garments that adorned the images of the saints, not sparing even the varnish on the altars. The better to discover the nature of such a phenomenon, I examined the stomach of the locust, but only found one thin and soft membrane, with which, and the liquor it contains, it destroys and dissolves all kind of substances, equally with the most caustic and venomous plants; extracting from them a sufficient and salutary nourishment.

"Out of curiosity to know the nature of so formidable a creature, I was urged to examine all its parts with the utmost exactness: its head is of the size of a pea, though longer, its forehead pointing downwards like the handsome Andalusian horse, its mouth large and open, its eyes black and rolling, added to a timid aspect not unlike a hare. With such a dastardly countenance who would imagine this creature to be the scourge of mankind! In its two jaws it has four incisive teeth, whose sharp points traverse each other like scissars, their mechanism being such as to gripe or to cut. Thus armed, what can resist a legion of such enemies? After devouring the vegetable kingdom, were they, in proportion to their strength and numbers, to become carnivorous like wasps, they would be able to destroy whole flocks of sheep, even to the dogs and shepherds; just as we are told of ants in America, that will overcome the fiercest serpents.

"The locust spends the months of April, May, and June, in the place of its birth: at the end of June its wings have a fine rose colour, and its body is strong. Being then in their prime, they assemble for the last time, and burn with a desire to propagate their species: this is observed by their motions, which are unequal in the two sexes. The male is restless and solicitous, the female is coy, and eager after food, flying the approaches of the male, so that the morning is spent in the courtship of the one and the retreat of the other. About ten o'clock, when the warmth of the sun has cleared their wings from the dampness of the night, the females seem uneasy at the forwardness of the males, who continuing their pursuit, they rise together 500 feet high, forming a black cloud that darkens the rays of the sun. The clear atmosphere of Spain becomes gloomy, and the finest summer day of Estremadura more dismal than the winter of Holland. The rustling of so many millions of wings in the air, seems like the trees of a forest agitated by the wind. The first direction of this formidable column is always against the wind, which if not too strong, the column will extend about a couple of leagues. The locusts then make a halt, when the most dreadful havoc begins; their sense of smell being so delicate, they can find at that distance a corn-field or a garden, and after demolishing it, rise again in pursuit of another: this may be said to be done in an instant. Each seems to have, as it were,

Gryllus

four arms and two feet: the males climb up the plants, as sailors do the shrouds of a ship, and nip off the tenderest buds, which fall to the females below.

Gryphius.

"Many old people assured me, when so much mischief was done in 1754, it was the third time in their remembrance, and that they always are found in the pasture grounds of Estramadura, from whence they spread into the other provinces of Spain. They are certainly indigenous, being of a different shape from those of the North or the Levant, as is evident in comparing them with such in the cabinets of natural history. The locust of Spain is the only one that has rose-coloured wings: besides, it is impossible they can come from any other part. From the north it is clear they do not, by the observation of so many ages; from the south they cannot, without crossing the sea, which is hardly possible by the shortness of their flight: and like birds of passage, they would be known. I once saw a cloud of them pass over Malaga, and move towards the sea, and go over it, for about a quarter of a league, to the great joy of the inhabitants, who concluded they would soon be drowned; but, to their disappointment, they suddenly veered about towards the coast, and pitched upon an uncultivated space surrounded with vineyards, which they soon after quitted. When once they appear, let the number demolished be ever so great, the proportion remaining is still too considerable: therefore, the only way to put an end to such a calamity, is to attack them beforehand, and destroy their eggs, by which means they might be totally extirpated." See Plate CCXXI.

GRYNÆUS (Simon), son to a peasant of Suabia, born in 1493, was Greek professor at Heidelberg, in 1523. He took a tour into England, and received great civility from the lord chancellor Sir Thomas More, to whom Erasmus had recommended him. He was a learned and laborious man, and did great service to the commonwealth of letters. He was the first who published the *Almagest* of Ptolemy in Greek. He also published a Greek Euclid, and Plato's works, with some commentaries of Proclus.

GRYPHIUS (Sebastian), a celebrated printer of Lyons in France, was a German, and born at Suabia near Augsburg in 1494. He restored the art of printing at Lyons, which was before exceedingly corrupted; and the great number of books printed by him are valued by the connoisseurs. He printed many books in Hebrew, Greek, and Latin, with new and very beautiful types; and his editions are no less accurate than beautiful. The reason is, that he was a very learned man, and perfectly versed in the languages of such books as he undertook to print. Thus a certain epigrammatist has observed, that Robert Stephens was a very good corrector, Colinæus a very good printer, but that Gryphius was both an able printer and corrector. This is the epigram:

"*Inter tot norunt libros qui cedere, tres sunt*

"*Insignes: languet cetera turba fama*

"*Castigat Stephanus, sculpsit Colinæus, utrumque*

"*Gryphius edocta mente manuque facit.*"

He died 1556, in his 63d year: and his trade was carried on honourably in the same city by his son, Anthony Gryphius. One of the most beautiful books of Sebastian Gryphius is a Latin Bible: it was printed 1550,

2.

with the largest types that had then been seen, in 2 vols Gryphites folio.

GRYPHITES, in natural history, in English *Crow's Stone*, an oblong fossil shell, very narrow at the head, and becoming gradually wider to the extremity, where it ends in a circular limb; the head or beak of this is very hooked or bent inward.

They are frequently found in our gravel or clay-pits in many counties. There are three or four distinct species of them; some are extremely rounded and convex on the back, others less so; and the plates of which they are composed, are in some smaller and thinner, in others thicker and larger, in specimens of the same bigness.

GUADALAJARA, or GUADALAXARA, a town of Spain, in New Castile, and district of Alcala, seated on the river Herares. W. Long. 2. 45. N. Lat. 40. 36.

GUADALAJARA, a considerable town of North America, and capital of a rich and fertile province of the same name, with a bishop's see. W. Long. 114. 59. N. Lat. 20. 20.

GUADALAVIAR, a river of Spain, which rises on the confines of Arragon and New Castile, and, running by Turvel in Arragon, crosses the kingdom of Valencia, passes by the town of the same name, and soon after falls into the Mediterranean sea, a little below Valencia.

GUADALQUIVER, one of the most famous rivers of Spain, rises in Andalusia, near the confines of Granada, and running quite through Andalusia, by the towns of Baiza, Andaxar, Cordova, Seville, and St Lucar, falls at last into the Bay of Cadiz.

GUADALUPE, a handsome town in Spain, in Estramadura, with a celebrated convent, whose structure is magnificent, and is immensely rich. It is seated on a rivulet of the same name. E. Long. 3. 50. N. Lat. 39. 15.

GUADALUPE, one of the Caribbee islands, belonging to the French, the middle of which is seated in about N. Lat. 16. 30. W. Long. 61. 20.

This island, which is of an irregular figure, may be about 80 leagues in circumference. It is divided into two parts by a small arm of the sea, which is not above two leagues long, and from 15 to 40 fathoms broad. This canal, known by the name of the *Salt River*, is navigable, but will only carry vessels of 50 tons burden.

That part of the island which gives its name to the whole colony is, towards the centre, full of craggy rocks, where the cold is so intense, that nothing will grow upon them but fern, and some useless shrubs covered with moss. On the top of these rocks, a mountain called *la Souphriere*, or the *Brimstone Mountain*, rises to an immense height. It exhales, through various openings, a thick black smoke, intermixed with sparks that are visible by night. From all these hills flow numberless springs, which fertilize the plains below, and moderate the burning heat of the climate by a refreshing stream, so celebrated, that the galleons which formerly used to touch at the Windward Islands, had orders to renew their provision with this pure and salubrious water. Such is that part of the island properly called *Guadalupe*. That which is commonly called

Grand

Guadalupe. *Grand Terre*, has not been so much favoured by nature. It is indeed less rugged; but it wants springs and rivers. The soil is not so fertile, or the climate so wholesome or so pleasant.

No European nation had yet taken possession of this island, when 550 Frenchmen, led on by two gentlemen named *Loline* and *Dupleffis*, arrived there from Dieppe on the 28th of June 1635. They had been very imprudent in their preparations. Their provisions were so ill chosen, that they were spoiled in the passage, and they had shipped so few, that they were exhausted in two months. They were supplied with more from the mother-country. St Christopher's, whether from scarcity or design, refused to spare them any; and the first attempts in husbandry they made in the country, could not as yet afford any thing. No resource was left for the colony but from the savages; but the superfluities of a people, who cultivate but little, and therefore had never laid up any stores, could not be very considerable. The new comers, not content with what the savages might freely and voluntarily bring, came to a resolution to plunder them; and hostilities commenced on the 16th of January 1636.

The Caribs, not thinking themselves in a condition openly to resist an enemy who had so much the advantage from the superiority of their arms, destroyed their own provisions and plantations, and retired to *Grand Terre*, or to the neighbouring islands. From thence the most desperate came over to the island from which they had been driven, and concealed themselves in the thickest parts of the forests. In the day-time, they shot with their poisoned arrows, or knocked down with their clubs, all the Frenchmen who were scattered about for hunting or fishing. In the night, they burned the houses and destroyed the plantations of their unjust spoilers.

A dreadful famine was the consequence of this kind of war. The colonists were reduced to graze in the fields, to eat their own excrements, and to dig up dead bodies for their subsistence. Many who had been slaves at Algiers, held in abhorrence the hands that had broken their fetters; and all of them cursed their existence. It was in this manner that they atoned for the crime of their invasion, till the government of Aubert brought a peace with the savages at the end of the year 1640. The remembrance, however, of hardships endured in an invaded island, proved a powerful incitement to the cultivation of all articles of immediate necessity; which afterwards induced an attention to those of luxury consumed in the mother-country. The few inhabitants who had escaped the calamities they had drawn upon themselves, were soon joined by some discontented colonists from St Christopher's, by Europeans fond of novelty, by sailors tired of navigation, and by some sea-captains, who prudently chose to commit to the care of a grateful soil the treasures they had saved from the dangers of the sea. But still the prosperity of *Guadalupe* was stopped or impeded by obstacles arising from its situation.

The facility with which the pirates from the neighbouring islands could carry off their cattle, their slaves, their very crops, frequently brought them into a desperate situation. Intestine broils, arising from jealousies of authority, often disturbed the quiet of the planters. The adventurers who went over to the windward islands,

disdaining a land that was fitter for agriculture than *Guadalupe* for naval expeditions, were easily drawn to *Martinico* by the convenient roads it abounds with. The protection of those intrepid pirates brought to that island all the traders who flattered themselves that they might buy up the spoils of the enemy at a low price, and all the planters who thought they might safely give themselves up to peaceful labours. This quick population could not fail of introducing the civil and military government of the Caribbee islands into *Martinico*. From that time the French ministry attended more seriously to this than to the other colonies, which were not so immediately under their direction; and hearing chiefly of this island, they turned all their encouragements that way.

It was in consequence of this preference, that in 1700 the number of inhabitants in *Guadalupe* amounted only to 3825 white people, 325 savages, free negroes, mulattoes, and 6725 slaves, many of whom were Caribs. Her cultures were reduced to 60 small plantations of sugar, 66 of indigo, a little cocoa, and a considerable quantity of cotton. The cattle amounted to 1620 horses and mules, and 3699 head of horned cattle. This was the fruit of 60 years labour. But her future progress was as rapid as her first attempts had been slow.

At the end of the year 1755, the colony was peopled with 9643 whites, 41,140 slaves of all ages and of both sexes. Here saleable commodities were the produce of 334 sugar-plantations, 15 plots of indigo, 46,840 stems of cocoa, 11,700 of tobacco, 2,257,725 of coffee, 12,748,447 of cotton. For her provisions she had 29 squares of rice or maize, and 1219 of potatoes or yams, 2,028,520 banana trees, and 32,577,950 trenches of cassava. The cattle of *Guadalupe* consisted of 4946 horses, 2924 mules, 125 asses, 13,716 head of horned cattle, 11,162 sheep or goats, 2444 hogs. Such was the state of *Guadalupe* when it was conquered by the British in the month of April 1759.

France lamented this loss; but the colony had reason to comfort themselves for this disgrace. During a siege of three months, they had seen their plantations destroyed, the buildings that served to carry on their works burnt down, and some of their slaves carried off. Had the enemy been forced to retreat after all these devastations, the island was ruined. Deprived of all assistance from the mother-country, which was not able to send her any succours; and expecting nothing from the Dutch (who, on account of their neutrality, came into her roads), because she had nothing to offer them in exchange; she could never have subsisted till the ensuing harvest.

The conquerors delivered them from these apprehensions. The British, indeed, are no merchants in their colonies. The proprietors of lands, who mostly reside in Europe, send to their representatives whatever they want, and draw the whole produce of the estate by the return of their ship. An agent settled in some sea-port of Great Britain is intrusted with the furnishing the plantation and receiving the produce. This was impracticable at *Guadalupe*; and the conquerors in this respect were obliged to adopt the custom of the conquered. The British, informed of the advantage the French made of their trade with the colonies,

Guadalupe, Guadiana. colonies, hastened, in imitation of them, to send their ships to the conquered island; and so multiplied their expeditions, that they overstocked the market, and sunk the price of all European commodities. The colonists bought them at a very low price; and, in consequence of this plenty, obtained long delays for the payment.

To this credit, which was necessary, was soon added another arising from speculation, which enabled the colony to fulfil its engagements. A great number of negroes were carried thither, to hasten the growth and enhance the value of the plantations. It has been said in various memorials, all copied from each other, that the English had stocked Guadalupe with 30,000 during the four years and three months that they remained masters of the island. The registers of the custom-houses, which may be depended on, as there could be no inducement for an imposition, attest that the number was no more than 18,721. This was sufficient to give the nation well-grounded hopes of reaping great advantages from their new conquest. But their hopes were frustrated; and the colony, with its dependencies, was restored to its former possessors by the treaty of peace in July 1763.

By the survey taken in 1767, this island, including the smaller islands, Descada, St Bartholomew, Marigalante, and the Saints, dependent upon it, contains 11,863 white people of all ages and of both sexes, 752 free blacks and mulattoes, 72,761 slaves; which makes in all a population of 85,376 souls. The cattle consists of 5060 horses, 4854 mules, 111 asses, 17,378 head of horned cattle, 14,895 sheep or goats, and 2669 hogs. The provision is 30,476,218 trenches of cassava, 2,819,262 banana trees, 2118 squares of land planted with yams and potatoes. The plantations contain 72 arnotto trees, 327 of cassia, 13,292 of cocoa, 5,881,176 of coffee, 12,156,769 of cotton, 21,474 squares of land planted with sugar-canes. The woods occupy 22,097 squares of land. There are 20,247 in meadows, and 6405 are uncultivated or forsaken. Only 1582 plantations grow cotton, coffee, and provisions. Sugar is made but in 401. These sugar works employ 140 water-mills, 263 turned by oxen, and 11 wind-mills.

The produce of Guadalupe, including what is poured in from the small islands under her dominion, ought to be very considerable. But in 1768 it yielded to the mother-country no more than 140,418 quintals of fine sugar, 23,603 quintals of raw sugar, 34,205 quintals of coffee, 11,955 quintals of cotton, 456 quintals of cocoa, 1884 quintals of ginger, 2529 quintals of logwood, 24 chests of sweetmeats, 165 chests of liquors, 34 casks of rum, and 1202 undressed skins. All these commodities were sold in the colony only for 310,792l. 18s. 3d. and the merchandise it has received from France has cost but 197,919l. 18s. 6d.

GUADIANA, a large river of Spain, having its source in New Castile, and, passing cross the high mountains, falls down to the lakes called *Ojos of Guadiana*; from whence it runs to Calatrava, Medelin, Merida, and Badajoz in Estremadura of Spain; and after having run for some time in Alentejo in Portugal, it passes on to separate the kingdom of Algarve from

Andalusia, and falls into the bay or gulph of Cadiz between Castro Marino and Agramonte. *Guadix, Guajacum.*

GUADIX, a town of Spain, in the kingdom of Granada, with a bishop's see. It was taken from the Moors in 1253, who afterwards retook it, but the Spaniards again got possession of it in 1489. It is seated in a fertile country, in W. Long. 2. 12. N. Lat. 37. 5.

GUAJACUM, *LIGNUM VITÆ*, or *Pockwood*: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 14th order, *Gruinales*. The calyx is quinquefid and unequal; the petals five, and inserted into the calyx; the capsule is angulated, and trilocular or quinquelocular.

Species. 1. The officinale, or common *lignum vitæ* used in medicine, is a native of the West India Islands and the warmer parts of America. There it becomes a large tree, having a hard, brittle, brownish bark, not very thick. The wood is firm, solid, ponderous, very resinous, of a blackish yellow colour in the middle, and of a hot aromatic taste. The smaller branches have an ash-coloured bark, and are garnished with leaves divided by pairs of a bright green colour. The flowers are produced in clusters at the end of the branches, and are composed of oval concave petals of a fine blue colour. 2. The sanctum, with many pairs of obtuse lobes, hath many small lobes placed along the mid-rib by pairs of a darker green colour than those of the foregoing sort. The flowers are produced in loose bunches towards the end of the branches, and are of a fine blue colour, with petals fringed on the edges. This species is also a native of the West India islands, where it is called *bastard lignum vitæ*. 3. The Afrum, with many blunt-pointed leaves, is a native of the Cape of Good Hope. The plants retain their leaves all the year, but have never yet flowered in this country.

Culture. The first species can only be propagated by seeds, which must be procured from the countries where it naturally grows. They must be sown fresh in pots, and plunged into a good hot-bed, where they will come up in six or eight weeks. While young, they may be kept in a hot-bed of tan-bark under a frame during the summer; but in autumn they must be removed into the bark-stove, where they should constantly remain. The second sort may be propagated the same way; but the third is to be propagated by layers, and will live all the winter in a good greenhouse.

Uses. The wood of the first species is of very considerable use both in medicine and in the mechanical arts. It is so compact and heavy as to sink in water. The outer part is often of a pale yellowish colour; but the heart is blacker, or of a deep brown. Sometimes it is marbled with different colours. It is so hard as to break the tools which are employed in felling it; and is therefore seldom used as firewood, but is of great use to the sugar-planters for making wheels and cogs to the sugar-mill. It is also frequently wrought into bowls, mortars, and other utensils. It is brought over hither in large pieces of four or five hundred weight each; and from its hardness and beauty is in great demand for various articles of turnery ware.

The wood, gum, bark, fruit, and even the flowers

Guaiacum.

of this tree, have been found to possess medicinal virtues; but it is only the three first, and more particularly the wood and resin, which are now in general use in Europe. The wood has little or no smell, except when heated, or while rasping, and then a slight aromatic one is perceived. When chewed, it impresses a mild acrimony, biting the palate and fauces. Its pungency resides in its resinous matter, which it gives it out in some degree to water by boiling, but spirit extracts it wholly.

Of the *bark* there are two kinds; one smooth, the other unequal on the surface: they are both of them weaker than the wood; though, while in a recent state, they are strongly cathartic.

The gum, or rather gummy resin, is obtained by wounding the bark in different parts of the body of the tree, or by what has been called *jagging*. It exudes copiously from the wounds, though gradually; and when a quantity is found accumulated upon the several wounded trees, hardened by exposure to the sun, it is gathered and packed in small kegs for exportation. This resin is of a friable texture, of a deep greenish colour, and sometimes of a reddish hue; it has a pungent acrid taste but little or no smell, unless heated. The tree also yields a spontaneous exudation from the bark, which is called the *native gum*, and is brought to us in small irregular pieces, of a bright semipellucid appearance, and differs from the former in being much purer.

In the choice of the wood, that which is the freshest, most ponderous, and of the darkest colour, is the best; the largest pieces are to be preferred too; and the best method is to rasp them as wanted, for the finer parts are apt to exhale when the raspings or chips are kept a while.

In choosing the resin, prefer those pieces which have slips of the bark adhering to them, and that easily separate therefrom by a quick blow. The resin is sometimes sophisticated by the negroes with the gum of the manchineal tree; but this is easily detected by dissolving a little in spirit of wine or rum. The true gum imparts a whitish or milky tinge, but the manchineal gives a greenish cast. Mouch advises a few drops of *spirit. nitri dulc.* to be added to the spirituous solution, and then to be diluted with water, by which the gum is to be precipitated in a blue powder; but the adulteration will appear floating in white stræ, &c.

Guaiacum was first introduced into Europe as a remedy for the venereal disease; and appears to have been used in Spain so early as 1508. The great success attending its administration before the proper use of mercury was known, brought it into such repute, that it is said to have been sold for seven old crowns a pound. It did not, however, continue to maintain its reputation; but was found generally to fail where the disease was deep-rooted, and was at length superseded by mercury, to which it now only serves occasionally as an adjuvant in the *decoctum lignorum*, of which guaiacum is the chief ingredient.

The general virtues of guaiacum are those of a warm stimulating medicine; strengthening the stomach and other viscera, and remarkably promoting the urinary and cuticular discharges: hence, in cutaneous defecations, and other disorders proceeding from obstructions of the excretory glands, and where sluggish serous hu-

mours abound, they are eminently useful; rheumatic and other pains have often been relieved by them. They are also laxative. The resin is the most active of these drugs, and the efficacy of the others depends upon the quantity of this part contained in them. The resin is extracted from the wood in part by watery liquors, but much more perfectly by spirituous ones. The watery extract of this wood, kept in the shops, proves not only less in quantity, but considerably weaker than one made with spirit. This last extract is of the same quality with the native resin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains to a scruple or half a dram, which last dose proves for the most part considerably purgative. The officinal preparations of guaiacum are, an extract of the wood, a solution of the gum in rectified spirit of wine and a solution in volatile spirit, and an empyreumatic oil distilled from the wood. The resin dissolved in rum, or combined with water, by means of mucilage or the yolk of egg, or in form of the volatile tincture or elixir, is much employed in gout and chronic rheumatism. The tincture or elixir has been given to the extent of half an ounce twice a-day, and is sometimes usefully combined with laudanum.

GUALEOR, GUALIOR, or *Gowalier*, a large town of Indostan in Asia, and capital of a province of the same name, with an ancient and celebrated fortress of great strength. It is situated in the very heart of Hindostan Proper, being about 80 miles to the south of Agra, the ancient capital of the empire, and 130 from the nearest part of the Ganges. From Calcutta it is, by the nearest rout, upwards of 800 miles, and 910 by the ordinary one; and about 280 from the British frontiers. Its latitude is 26. 14. and longitude 78. 26. from Greenwich.

In the ancient division of the empire it is classed in the Soubah of Agra, and is often mentioned in history. In the year 1008, and during the two following centuries, it was thrice reduced by famine. It is probable that it must in all ages have been deemed a military post of utmost consequence, both from its situation in respect to the capital, and from the peculiarity of its site, which was generally deemed impregnable. With respect to its relative position, it must be considered that it stands on the principal road leading from Agra to Malwa, Guzerat, and the Decan; and that too near the place where it enters the hilly tract which advances from Bundelcund, Malwa, and Agimere, to a parallel with the river Jumnah, throughout the greatest part of its course. And from all these circumstances of general and particular situation, together with its natural and acquired advantages as a fortress, the possession of it was deemed as necessary to the ruling emperors of Hindostan as Dover castle might have been to the Saxon and Norman kings of England. Its palace was used as a state prison as early as 1317, and continued to be such until the downfall of the empire.—On the final dismemberment of the empire, Gualcor appears to have fallen to the lot of a rajah of the Jat tribe; who assumed the government of the district in which it is immediately situated, under the title of Rana of Gohud or Gohd. Since that period it has changed masters more than once; the Mahrattas, whose dominions extend to the neighbourhood of it,

Guaiacum,
Gualcor.

Gualeor. it, having sometimes possessed it, and at other times the Rana: but the means of transfer were always either famine or treachery, nothing like a siege having ever been attempted.

Gualeor was in the possession of Madajee Scindia, a Mahratta chief, in 1779, at the close of which year the council-general of Bengal concluded an alliance with the Rana; in consequence of which, four battalions of sepoy of 500 men each, and some pieces of artillery, were sent to his assistance, his district being over-run by the Mahrattas, and himself almost shut up in his fort of Gohud. The grand object of his alliance was to penetrate into Scindia's country, and finally to draw Scindia himself from the western side of India, where he was attending the motions of general Goddard, who was then employed in the reduction of Guzerat; it being Mr Hastings's idea, that when Scindia found his own dominions in danger, he would detach himself from the confederacy, of which he was the principal member, and thus leave matters open for an accommodation with the court of Poonah. It fell out exactly as Mr Hastings predicted. Major William Popham was appointed to the command of the little army sent to the Rana's assistance; and was very successful, as well in clearing his country of the enemy, as in driving them out of one of their own most valuable districts, and keeping possession of it: and Mr Hastings, who justly concluded that the capture of Gualeor, if practicable, would not only open the way into Scindia's country, but would also add to the reputation of our arms in a degree much beyond the risk and expence of the undertaking, repeatedly expressed his opinion to major Popham, together with a wish that it might be attempted; and founding his hopes of success on the confidence that the garrison would probably have in the natural strength of the place. It was accordingly undertaken; and the following account of the place, and the manner of our getting possession of it, was written by captain Jonathan Scott, at that time Persian interpreter to major Popham, to his brother major John Scott.

"The fortress of Gualeor stands on a vast rock of about four miles in length, but narrow, and of unequal breadth, and nearly flat at the top. The sides are so steep as to appear almost perpendicular in every part; for where it was not naturally so, it has been scraped away; and the height from the plain below is from 200 to 300 feet. The rampart conforms to the edge of the precipice all round; and the only entrance to it is by steps running up the side of the rock, defended on the side next the country by a wall and bastions, and farther guarded by seven stone gateways, at certain distances from each other. The area within is full of noble buildings, reservoirs of water, wells, and cultivated land; so that it is really a little district in itself. At the north-west foot of the mountain is the town, pretty large, and well built; the houses all of stone. To have besieged this place would be vain, for nothing but a surprise or blockade could have carried it.

"A tribe of banditti from the district of the Rana had been accustomed to rob about this town, and once in the dead of night had climbed up the rock and got into the fort. This intelligence they had communicated to the Rana, who often thought of availing himself

N^o 145.

of it, but was fearful of undertaking an enterprize of such moment with his own troops. At length he informed major Popham of it, who sent a party of the robbers to conduct some of his own spies to the spot. They accordingly climbed up in the night, and found that the guards generally went to sleep after their rounds. Popham now ordered ladders to be made; but with so much secrecy, that until the night of surprise only myself and a few others knew it. On the 3d of August, in the evening, a party was ordered to be in readiness to march under the command of captain William Bruce; and Popham put himself at the head of two battalions, which were immediately to follow the storming party. To prevent as much as possible any noise in approaching or ascending the rock, a kind of shoes, of woollen cloth were made for the sepoy, and stuffed with cotton. At eleven o'clock the whole detachment marched from the camp at Reypour, eight miles from Gualeor, thro' unfrequented paths, and reached it at a little before day-break. Just as captain Bruce arrived at the foot of the rock, he saw the lights which accompanied the rounds moving along the rampart, and heard the sentinels cough (the mode of signifying that all is well in an Indian camp or garrison), which might have damped the spirit of many men, but served only to inspire him with more confidence, as the moment for action, that is, the interval between the passing the rounds, was now ascertained. Accordingly, when the lights were gone, the wooden ladders were placed against the rock, and one of the robbers first mounted, and returned with an account that the guard was retired to sleep. Lieutenant Cameron, our engineer, next mounted, and tied a rope-ladder to the battlements of the wall; this kind of ladder being the only one adapted to the purpose of scaling the wall in a body (the wooden ones only serving to ascend from crag to crag of the rock, and to assist in fixing the rope-ladders). When all was ready, captain Bruce, with 20 sepoy, grenadiers, ascended without being discovered, and squatted down under the parapet; but before a reinforcement arrived, three of the party had so little recollection as to fire on some of the garrison who happened to be lying asleep near them. This had nearly ruined the whole plan; the garrison were of course alarmed, and ran in great numbers towards the place; but, ignorant of the strength of the assailants (as the men fired on had been killed outright), they suffered themselves to be stopped by the warm fire kept up by the small party of the grenadiers, until major Popham himself, with a considerable reinforcement, came to their aid. The garrison then retreated to the inner buildings, and discharged a few rockets, but soon afterwards retreated precipitately through the gate; whilst the principal officers, thus deserted, assembled together in one house, and hung out a flag. Major Popham sent an officer to give them assurance of quarter and protection; and thus, in the space of two hours, this important and astonishing fortress was completely in our possession. We had only 20 men wounded and 1 killed. On the side of the enemy, Bapogee the governor was killed, and most of the principal officers wounded."

Thus fell the strongest fortress in Hindostan, garrisoned by a chosen body of 1200 men, on August 4.

1780;

Guam.

1780; and which, before the capture of it by the British, was pronounced by the princes of Hindostan, as far as their knowledge in the military art extended, to be impregnable. In 1783 Madajee Scindia besieged this fortress, then possessed by the Rana of Gohud, with an army of 70,000 men, and effected the reduction by the treachery of one of the Rana's officers, who formed the plan of admission of a party of Scindia's troops; these were immediately supported by another party, who attacked an opposite quarter, and got admission also.

GUAM, the largest of the Ladrone islands in the South Sea, being about 40 leagues in circumference. It is the only one among the innumerable islands that lie scattered in the immense South Sea which has a town built in the European style, with a regular fort, a church, and civilized inhabitants. The air is excellent, the water good, the garden stuffs and fruits are exquisite, the flocks of buffaloes innumerable, as are those of goats and hogs, and all kinds of poultry abound in an astonishing degree. There is no port in which worn-out sailors can be more speedily restored, or find better or more plentiful refreshments, than in this.

But Guam did not formerly enjoy this state of abundance. When it was first discovered by Magellan in 1521, with the other eight principal islands that lie north of it, which, with a multitude of smaller ones, form together that archipelago known by the name of the Ladrone, they were all crowded with inhabitants, but afforded no refreshments to navigators except fish, bananas, cocoa nuts, and bread fruit; and even these could not be procured but by force, amidst showers of the arrows and lances of the natives. The Spaniards carried thither from America the first stock of cattle, of fowls, of plants, and seeds, and fruits, as well as garden stuffs, which are all now found in such abundance.

The Ladrone islands, and Guam in particular, were covered with inhabitants when they were discovered. It is said that Guam alone contained upon its coasts more than 20,000 people. These men were ferocious savages and bold thieves, as all the islanders in the south seas are, undoubtedly because they were unacquainted with the rights of property; but they were so savage, so incapable of supporting the yoke of civilization, that the Spaniards, who undertook to bring them under the regulations of law and order, have seen their numbers almost annihilated within the space of two centuries. Under the government of their missionaries, these fierce islanders, after having long defended, by cruel wars, the right of living like wild beasts under the guidance of instinct, being at last obliged to yield to the superiority of the Spanish arms, gave themselves up to despair: they took the resolution of administering poisons to their women, in order to procure abortions, and to render them sterile, that they might not bring into the world, and leave behind them, beings that were not free, according to the ideas that they had of liberty. A resolution so violent, and so contrary to the views and intentions of nature, was persisted in with so much obstinacy in the nine Ladrone islands, that their population, which at the time of the discovery consisted of more than 60,000 souls, does not now exceed 800 or 900 in the whole

VOL.VIII. Part I.

Guam.

extent of the archipelago. About 20 or 30 years ago, the scattered fragments of the original natives were collected and established in the island of Guam, where they now begin to recover by the wise precautions, and prudent, though tardy, exertions of a government more adapted to the climate of these islands and to the genius of their inhabitants.

The principal settlement, which the Spaniards call the town of Agana, is situated about four leagues north-east of the landing-place, on the sea-shore, and at the foot of some hills not very high, in a beautiful well-watered country. Besides this, there are 21 smaller settlements of Indians round the island, all on the sea-shore, composed of five or six families, who cultivate fruits and grain, and employ themselves in fishing.

The centre of the island is still uncleared. The trees are not very tall, but they are fit for the building of houses and of boats. The forests are in general very thick. The Spaniards at first cleared certain portions of land to turn them into savannahs for the feeding of cattle. The formation of savannahs consists in multiplying within the forests small cleared spots separated only by thickets and rows of trees, and kept clean from shrubs of every kind. The Spaniards sow these spots with grass seeds, and other indigenous plants that are fit for pasturage. These meadows, being effectually shaded on every quarter, preserve their freshness, and afford the flocks and herds a shelter from the sun and the great heat of noon. The cattle that were formerly brought to the savannahs of Guam from America have multiplied astonishingly: they are become wild, and must be shot when wanted, or taken by stratagem.

The woods are likewise full of goats, of hogs, and fowls, which were all originally brought thither by the Spaniards, and are now wild. The flesh of all these animals is excellent. In the savannahs, and even in the heart of the forests, there is a vast multitude of pigeons, of parroquets, of thrushes, and of blackbirds.

Among the indigenous trees of the country, the most remarkable are, the cocoa-nut tree and the bread-fruit tree. The woods are also filled with guavas, bananas, or plantanes of many varieties, citrons, lemons, and oranges, both sweet and bitter, and the small dwarf thorny china-orange with red fruit. The caper-bush abounds in all the Ladrone islands; and as it is constantly in flower, as well as the citron and orange shrubs, with many other of the indigenous plants, they perfume the air with the most agreeable smells, and delight the eye with the richest colours.

The rivers of Guam, which are either rivulets or torrents, abound in fish of an excellent quality: the Indians, however, eat none of them, but prefer the inhabitants of the sea. The turtle, which grow here as large as those in the island of Ascension, are not eaten either by the Indians or Spaniards.

The cultivated crops lately introduced are, the rice, the maize, the indigo, the cotton, the cocoa, the sugar-cane, which have all succeeded. That of the maize, especially, is of astonishing fertility: it is common to find in the fields where this grain is cultivated plants of twelve feet high, bearing eight or ten spikes from nine to ten inches in length, set round with well-filled seeds. The gardens are stored with mangoes

X

and

Guamanga and pine-apples. The former is one of the finest fruits imaginable: it was brought from Manilla, and may be eaten in great quantity without any bad consequences. — **Guaranty.** —Horses have been brought to Guam from Manilla, and asses and mules from Acapulco. The Indians have been taught to tame and domesticate the ox, and to employ him in the draught.

This island, the land of which rises gradually from the sea-shore towards the centre by a gentle acclivity, is not very mountainous. The inhabitants say, that its soil is equally rich and fertile over the whole island, except in the northern part, which forms a peninsula almost destitute of water. But in the rest, you cannot go a league without meeting a rivulet. Upon penetrating a little way into the interior part of the country, to the east and the south of Agana, many springs of fine water are found, forming, at little distances, basins of pure water, which, being shaded by thick trees, preserve a most agreeable coolness in spite of the heat of the climate.

The indigenous inhabitants are such as they were described by Magellan; of small stature, sufficiently ugly, black, and in general dirty, though they are continually in the water. The women are for the most part handsome, well made, and of a reddish colour. Both sexes have long hair. This scanty people have become by civilization gentle, honest, and hospitable. They have, however, at the same time acquired a vice that was unknown to their savage ancestors. The men are a little addicted to drunkenness, for they drink freely of the wine of the cocoa-nut. They love music and dancing much, but labour little. They are passionately fond of cock-fighting. On Sundays and holidays they gather together in crowds after the service, at the door of the church; where each Indian brings his cock to match him with that of his neighbour, and each bets upon his own.—The mission of Guam is now in the hands of the Augustine friars, who have supplanted the Jesuits. E. Long. 139. 25. N. Lat. 30. 26.

GUAMANGA, a considerable town of South America, and capital of a province of the same name in Peru, and in the audience of Lima, with a bishop's see. It is remarkable for its sweetmeats, manufactures, and mines of gold, silver, loadstone, and quicksilver. W. Long. 7. 50. S. Lat. 13. 0.

GUANUCO, a rich and handsome town of South America, and capital of a district of the same name in the audience of Lima. W. Long. 72. 55. S. Lat. 9. 55.

GUANZAVELCA, a town of South America, in Peru, and in the audience of Lima. It abounds in mines of quicksilver. W. Long. 71. 59. S. Lat. 12. 40.

GUARANTEE, or **WARRANTEE**, in law, a term relative to warrant or warranter, properly signifying him whom the warranter undertakes to indemnify or secure from damage.

GUARANTEE is more frequently used for a warranter, or a person who undertakes and obliges himself to see a second person perform what he has stipulated to the third. See **WARRANTY**.

GUARANTY, in matters of polity, the engagement of mediatorial or neutral states, whereby they

plight their faith that certain treaties shall be inviolably observed, or that they will make war against the aggressor.

GUARD, in a general sense, signifies the defence or preservation of any thing; the act of observing what passes, in order to prevent surprise; or the care, precaution, and attention, we make use of to prevent any thing from happening contrary to our intentions or inclinations.

GUARD, in the military art, is a duty performed by a body of men, to secure an army or place from being surprised by an enemy. In garrison the guards are relieved every day: hence it comes that every soldier mounts guard once every three or four days in time of peace, and much oftener in time of war. See **HONOURS**.

Advanced GUARD, is a party of either horse or foot, that marches before a more considerable body, to give notice of any approaching danger. These guards are either made stronger or weaker, according to situation, the danger to be apprehended from the enemy, or the nature of the country.

Van GUARD. See *Advanced GUARD*.

Artillery GUARD, is a detachment from the army to secure the artillery when in the field. Their *corps de garde* is in the front of the artillery park, and their centres dispersed round the same. This is generally a 48-hours guard; and upon a march, this guard marches in the front and rear of the artillery, and must be sure to leave nothing behind: if a gun or waggon breaks down, the officer that commands the guard is to leave a sufficient number of men to assist the gunners and matrosses in getting it up again.

Artillery Quarter-GUARD, is frequently a non-commissioned officer's guard from the royal regiment of artillery, whose *corps de garde* is always in the front of their incampment.

Artillery Rear-GUARD, consists in a corporal and six men, posted in the rear of the park.

Corps de GARDE, are soldiers entrusted with the guard of a post, under the command of one or more officers. This word also signifies the place where the guard mounts.

Grand GUARD; three or four squadrons of horse, commanded by a field-officer, posted at about a mile or a mile and a half from the camp, on the right and left wings, towards the enemy, for the better security of the camp.

Forage GUARD, a detachment sent out to secure the foragers, and who are posted at all places, where either the enemy's party may come to disturb the foragers, or where they may be spread too near the enemy, so as to be in danger of being taken. This guard consists both of horse and foot, and must remain on their posts till the foragers are all come off the ground.

Main GUARD, is that from which all other guards are detached. Those who are for mounting guard assemble at their respective captain's quarters, and march from thence to the parade in good order; where, after the whole guard is drawn up, the small guards are detached to their respective posts: then the subalterns throw lots for their guards, who are all under

Guard. under the command of the captain of the main guard. This guard mounts in garrison at different hours, according as the governor pleases.

Piquet GUARD, a good number of horse and foot, always in readiness in case of an alarm: the horses are generally saddled all the time, and the riders booted.

The foot draw up at the head of the battalion, frequently at the beating of the tat-too; but afterwards return to their tents, where they hold themselves in readiness to march upon any sudden alarm. This guard is to make resistance in case of an attack, until the army can get ready.

Baggage GUARD, is always an officer's guard, who has the care of the baggage on a march. The waggon should be numbered by companies, and follow one another regularly: vigilance and attention in the passage of hollow ways, woods, and thickets, must be strictly observed by this guard.

Quarter GUARD, is a small guard commanded by a subaltern officer, posted in the front of each battalion, at 222 feet before the front of the regiment.

Rear GUARD, that part of the army which brings up the rear on a march, generally composed of all the old grand guards of the camp. The rear-guard of a party is frequently eight or ten horse, about 500 paces behind the party. Hence the advance-guard going out upon a party, form the rear-guard in their retreat.

Rear GUARD, is also a corporal's guard placed in the rear of a regiment, to keep good order in that part of the camp.

Standard GUARD, a small guard under a corporal, out of each regiment of horse, who mount on foot in the front of each regiment, at the distance of 20 feet from the streets, opposite the main street.

Trench GUARD, only mounts in the time of a siege, and sometimes consists of three, four, or six battalions, according to the importance of the siege. This guard must oppose the besieged when they sally out, protect the workmen, &c.

Provost GUARD, is always an officer's guard that attends the provost in his rounds, either to prevent desertion, marauding, rioting, &c. See PROVOST.

GUARD, in fencing, implies a posture proper to defend the body from the sword of the antagonist.

Ordinary GUARDS, such as are fixed during the campaign, and relieved daily.

Extraordinary GUARDS, or detachments, which are only commanded on particular occasions; either for the further security of the camp, to cover the foragers, or for convoys, escorts, or expeditions.

GUARDS, also imply the troops kept to guard the king's person, and consist both of horse and foot.

Horse GUARDS, in England, are gentlemen chosen for their bravery, to be entrusted with the guard of the king's person; and were divided into four troops, called the 1st, 2d, 3d, and 4th troop of horse guards. The first troop was raised in the year 1660, and the command given to lord Gerard; the second in 1661, and the command given to Sir Philip Howard; the third in 1693, and the command given to earl Feverham; the fourth in 1792, and the command given to earl Newburgh. Each troop had one colonel, two lieutenant-colonels, one cornet and major, one guidon

and major, four exempts and captains, four brigadiers and lieutenants, one adjutant, four sub-brigadiers and cornets, and 60 private men. But the four troops are now turned into two regiments of life-guards.

Horse-Grenadier GUARDS, are divided into two troops, called the 1st and 2d troops of horse-grenadier guards. The first troop was raised in 1693, and the command given to lieutenant-general Cholmondeley; the second in 1702, and the command given to lord Forbes. Each troop has one colonel, lieutenant-colonel, one guidon or major, three exempts and captains, three lieutenants, one adjutant, three cornets, and 60 private men.

Yeomen of the GUARD, first raised by Henry VII. in the year 1485. They are a kind of pompous foot-guards to the king's person; and are generally called by a nickname the *Beef-Eaters*. They were anciently 250 men of the first rank under gentry; and of larger stature than ordinary, each being required to be six feet high. At present there are but 100 in constant duty, and 70 more not on duty; and when any one of the 100 dies, his place is supplied out of the 70. They go dressed after the manner of king Henry VIII's time. Their first commander or captain was the earl of Oxford, and their pay is 2s. 6d. per day.

Foot GUARDS, are regiments of foot appointed for the guard of his majesty and his palace. There are three regiments of them, called the 1st, 2d, and 3d regiments of foot-guards. They were raised in the year 1660; and the command of the first given to colonel Russel, that of the second to general Monk, and the third to the earl of Linlithgow. The first regiment is at present commanded by one colonel, one lieutenant-colonel, three majors, 23 captains, one captain-lieutenant, 31 lieutenants, and 24 ensigns; and contains three battalions. The second regiment has one colonel, one lieutenant-colonel, two majors, 14 captains, one captain-lieutenant, 18 lieutenants, 16 ensigns; and contains only two battalions. The third regiment is the same as the second.

The French GUARDS are divided into those within, and those without, the palace.—The first are the *gardes du corps*, or body-guards; which consist of four companies, the first of which companies was anciently Scots. See *Scots GUARDS*, *infra*.

The guards without are the *Gens d'Armes*, light horse, musqueteers, and two other regiments, the one of which is French and the other Swiss.

New arrangements, however, have taken place in this department as well as others since the late revolution.

Scots GUARDS; a celebrated band, which formed the first company of the ancient *gardes du corps* of France.

It happened from the ancient intercourse between France and Scotland, that the natives of the latter kingdom had often distinguished themselves in the service of the former. On this foundation the company of Scots guards, and the company of Scots gendarmes, were instituted.—Both of them owed their institution to Charles VII. of France, by whom the first standing army in Europe was formed, *anno* 1454; and their fates cannot but be interesting to Scotsmen. See *GENDARMES*.

Valour, honour, and fidelity, must have been very conspicuous features of the national character of the

Guard. Scots, when so great and civilized a people as the French could be induced to choose a body of them, foreigners as they were, for guarding the persons of their sovereigns.—Of the particular occasion and reasons of this predilection, we have a recital by Louis XII. a succeeding monarch. After setting forth the services which the Scots had performed for Charles VII. in expelling the English out of France, and reducing the kingdom to his obedience, he adds—"Since which reduction, and for the service of the Scots upon that occasion, and for the great loyalty and virtue which he found in them, he selected 200 of them for the guard of his person, of whom he made an hundred men at arms, and an hundred life-guards: And the hundred men at arms are the hundred lances of our ancient ordinances; and the life-guard men are those of our guard, who still are near and about our person."—As to their fidelity in this honourable station; the historian, speaking of Scotland, says, "The French have so ancient a friendship and alliance with the Scots, that of 400 men appointed for the king's life-guard, there are an hundred of the said nation who are the nearest to his person, and in the night keep the keys of the apartment where he sleeps. There are, moreover, an hundred complete lances and two hundred yeomen of the said nation, besides several that are dispersed thro' the companies: And for so long a time as they have served in France, never hath there been one of them found that hath committed or done any fault against the kings or their state; and they make use of them as of their own subjects."

Hist. of Louis XII. by Claud Seyfil, master of requests to that prince.

The ancient rights and privileges of the Scottish life-guards were very honourable; especially of the twenty-four first. The author of the Ancient Alliance says, "On high holidays, at the ceremony of the royal touch, the erection of knights of the king's order, the reception of extraordinary ambassadors, and the public entries of cities, there must be six of their number next to the king's person, three on each side; and the body of the king must be carried by these only, wheresoever ceremony requires. They have the keeping of the keys of the king's lodging at night, the keeping of the choir of the chapel, the keeping the boats where the king passes the rivers; and they have the honour of bearing the white silk fringe in their arms, which in France is the coronne couleur. The keys of all the cities where the king makes his entry are given to their captain in waiting or out of waiting. He has the privilege, in waiting or out of waiting, at ceremonies, such as coronations, marriages, and funerals of the kings, and at the baptism and marriage of their children, to take duty upon him. The coronation-robe belongs to him: and this company, by the death or change of a captain, never changes its rank, as do the three others."

This company's first commander, who is recorded as a person of great valour and military accomplishments, was Robert Patillock, a native of Dundee; and the band, ever ardent to distinguish itself, continued in great reputation till the year 1578. From that period, the Scots guards were less attended to, and their privileges came to be invaded. In the year 1612, they remonstrated to Louis XIII. on the subject of the injustice they had suffered, and set before him the services they had rendered to the crown of

France. Attempts were made to re-establish them on their ancient foundation; but no negotiation for this purpose was effectual. The troops of France grew jealous of the honours paid them: the death of Francis II. and the return of Mary to Scotland, at a time when they had much to hope, were unfortunate circumstances to them: the change of religion in Scotland, was an additional blow: and the accession of James VI. to the throne of England, disunited altogether the interests of France and Scotland. The Scots guards of France had therefore, latterly, no connection with Scotland but the name.

GUARD-Boat, a boat appointed to row the rounds amongst the ships of war which are laid up in any harbour, &c. to observe that their officers keep a good looking-out, calling to the guard-boat as she passes, and not suffering her crew to come on board, without having previously communicated the watch-word of the night.

GUARD-Ship, a vessel of war appointed to superintend the marine affairs in a harbour or river, and to see that the ships which are not commissioned have their proper watchward kept duly, by sending her guard-boats around them every night. She is also to receive seamen who are impressed in the time of war.

GUARDIAN, in law, a person who has the charge of any thing; but more commonly it signifies one who has the custody and education of such persons as have not sufficient discretion to take care of themselves and their own affairs, as children and idiots.

Their business is to take the profits of the minor's lands to his use, and to account for the same: they ought to sell all moveables within a reasonable time, and to convert them into land or money, except the minor is near of age, and may want such things himself; and they are to pay interest for the money in their hands, that might have been so placed out; in which case it will be presumed that the guardians made use of it themselves. They are to sustain the lands of the heir, without making destruction of any thing thereon, and to keep it safely for him: if they commit waste on the lands, it is a forfeiture of the guardianship, 3 Edw. I. And where persons, as guardians, hold over any land, without the consent of the person who is next intitled, they shall be adjudged trespassers, and shall be accountable; 6 Ann. cap. xviii.

GUARDIAN, or Warden, of the Cinque-ports, is an officer who has the jurisdiction of the cinque-ports, with all the power that the admiral of England has in other places.

Camden relates, that the Romans, after they had settled themselves and their empire in our island, appointed a magistrate, or governor, over the east parts, where the Cinque-ports lie, with the title of *comes litoris Saxonici per Britanniam*; having another, who bore the like title, on the opposite side of the sea. Their business was to strengthen the sea-coast with munition, against the outrages and robberies of the barbarians; and that antiquary takes our warden of the Cinque-ports to have been erected in imitation thereof. The wardenship is a place of value, supposed worth L. 7000 per annum.

GUARDIAN of the Spiritualities, the person to whom the spiritual jurisdiction of any diocese is committed, during the time the see is vacant. A guardian of the spi-

Guard, Guardian.

Guarea
(Guatemala)

spiritualities may likewise be either such in law, as the archbishop is of any diocese within his province; or by delegation, as he whom the archbishop or vicar-general for the time appoints. Any such guardian has power to hold courts, grant licences, dispensations, probates of wills, &c.

GUAREA, in botany: A genus of the monogynia order, belonging to the octandria class of plants. The calyx is quadrid; the petals four; the nectarium cylindrical, having the antheræ in its mouth; the capsule is quadrilocular and quadrivalvular; the seeds solitary.

GUARINI (Battista), a celebrated Italian poet, born at Ferrara, in 1538. He was great-grandson to Guarino of Verona, and was secretary to Alphonso Duke of Ferrara, who intrusted him with several important commissions. After the death of that prince, he was successively secretary to Vincenzo de Gonzaga, to Ferdinand de Medicis grand duke of Tuscany, and to Francis Maria de Feltri duke of Urbino. But the only advantages he reaped under these various masters, were great encomiums on his wit and compositions. He was well acquainted with polite literature; and acquired immortal reputation by his Italian poems, especially by his *Pastor Fido*, the most known and admired of all his works, and of which there have been innumerable editions and translations. He died in 1612.

GUARDIA, or **GUARDA**, a town of Portugal, in the province of Beira, with a bishop's see. It contains about 2300 inhabitants, is fortified both by art and nature, and has a stately cathedral. W. Long. 5. 17. N. Lat. 40. 20.

GUARDIA-Alferez, a town of Italy, in the kingdom of Naples, and in the Contado-di Molise, with a bishop's see. E. Long. 15. 53. N. Lat. 51. 50.

GUARGALA, or **GUERGUELA**, a town of Africa, and capital of a small kingdom of the same name, in Biledulgerid, to the south of Mount Atlas. E. Long. 9. 55. N. Lat. 28. 0.

GUARIBA, in natural history, the name of a species of monkey found in the West Indies. See **SIMIA**.

GUASTALLA, a strong town of Italy, in the duchy of Mantua, with the title of a duchy, remarkable for a battle between the French and Imperialists in 1734. It was ceded to the duke of Parma in 1748, by the treaty of Aix la Chapelle. It is seated near the river Po, in E. Long. 10. 33. N. Lat. 44. 55.

GUATIMALA, the *Audience* of, in North America, and in New Spain, is above 750 miles in length, and 450 in breadth. It abounds in chocolate, which they make use of instead of money. It has 12 provinces under it: and the native Americans, under the dominions of Spain, profess Christianity; but it is mixed with a great many of their own superstitions. There is a great chain of high mountains, which run across it from E. to W. and it is subject to earthquakes and storms. It is however very fertile; and produces, besides chocolate, great quantities of cochineal and cotton.

GUATIMALA, a province of North America, in New Spain, and in the Audience of the same name; bounded on the W. by Soconusco, on the N. by Verapaz and Honduras, on the E. by Nicaragua, and on the S. by the south sea. St Jago de Guatemala is the capital of the whole audience.

GUATIMALA, a large and rich town of North A-

merica, in New Spain; and capital of a government of the same name, with a bishop's see, and an university. It carries on a great trade, especially in chocolate. W. Long. 91. 30. N. Lat. 14. 0.

GAUTIMALA (the Volcano of), is a mountain, which throws out fire and smoke. St Jago de Guatemala was almost ruined by it in 1541. It was afterwards rebuilt at a good distance from this dreadful mountain. A few years ago, however, it was again destroyed, with circumstances more terrible perhaps than any mentioned in history.

GUAVA, in botany. See **PSIDIUM**.

GUAXACA, a province of North America, in New Spain, which is very fertile in wheat, Indian corn, cochineal, and cassia. It is bounded by the gulph of Mexico on the north, and by the south sea on the south. It contains mines of gold, silver, and crystal. Guaxaca is the capital town.

GUAXACA, a town of North America, in the Audience of Mexico, and capital of a province of the same name, with a bishop's see. It is without walls, and does not contain above 2000 inhabitants; but it is rich, and they make very fine sweet-meats and chocolate. It has several rich convents, both for men and women. W. Long. 100. N. Lat. 17. 45.

GUAYRA, a district of the province of La Plata, in South America, having Brasil on the east, and Paraguay on the west.

GUBEN, a handsome town of Germany, in Lower Lusatia, seated on the river Neisse, and belonging to the house of Sax-Merfenburg. E. 14. 59. N. Lat. 51. 55.

GUBER, a kingdom of Africa, in Negroland. It is surrounded with high mountains; and the villages, which are many, are inhabited by people who are employed in taking care of their cattle and sheep. There are also abundance of artificers, and linen-weavers, who send their commodities to Tombuto. The whole country is overflowed every year by the inundations of the Niger, and at that time the inhabitants sow their rice. There is one town which contains almost 6000 families, among whom are many merchants.

GUBIO, a town of Italy, in the territory of the church, and in the duchy of Urbino, with a bishop's see. E. Long. 12. 41. N. Lat. 43. 18.

GUDGEON, in ichthyology; a species of cyprinus. See **CYPRINUS**.

This fish, though small, is of so pleasant a taste, that it is very little inferior to smelt. They spawn twice in the summer-season; and their feeding is much like the barbels in streams and on gravel, slighting all manner of flies: but they are easily taken with a small red worm, fishing near the ground; and being a leather-mouthed fish, will not easily get off the hook when struck.—The gudgeon may be fished for with float, the hook being on the ground; or by hand, with a running line on the ground, without cork or float. But although the small red worm above mentioned is the best bait for this fish, yet wasps, gentles, and cad-baits will do very well. You may also fish for gudgeons with two or three hooks at once, and find very pleasant sport, where they rise any thing large. When you angle for them, stir up the sand or gravel with a long pole; this will make them gather to that place, bite faster, and with more eagerness.

Sea-GUDGEON, *Rock-fish*, or *Black Goby*. See **Gobius**.

Gautimala
||
Gudgeon.

Guebres

Guernsey.

GUEBRES, or GABRES. See GABRES.

GUELPHS, or GUELFs, a celebrated faction in Italy, antagonists of the Gibelins. See GIBELINS.

The guelphs and Gibelins filled Italy with blood and carnage for many years. The Guelphs stood for the Pope, against the emperor. Their rise is referred by some to the time of Conrad III. in the twelfth century; by others, to that of Frederic I.; and by others, to that of his successor Frederic II. in the thirteenth century.

The name of *Guelph* is commonly said to have been formed from *Welfe*, or *Welfo*, on the following occasion: the emperor Conrad III. having taken the duchy of Bavaria from Welfe VI. brother of Henry duke of Bavaria, Welfe, assisted by the forces of Roger king of Sicily, made war on Conrad, and thus gave birth to the faction of the Guelphs.

Others derive the name *Guelphs* from the German *Wolff*, on account of the grievous evils committed by that cruel faction: others deduce the denomination from that of a German called *Guelse*, who lived at Pistoie; adding, that his brother, named *Gibel*, gave his name to the Gibelins. See the article GIBELINS.

GUELDERLAND, one of the united provinces, bounded on the W. by Utrecht and Holland, on the E. by the bishoprick of Munster and the duchy of Cleves, on the N. by the Zuyder sea and Overijssel, and on the S. it is separated from Brabant by the Maes. Its greatest extent from N. to S. is about 47 miles, and from W. to E. near as much; but its figure is very irregular. The air here is much healthier and clearer than in the maritime provinces, the land lying higher. Excepting some part of what is called the *Veluwe*, the soil is fruitful. It is watered by the Rhine, and its three branches, the Wahal, the Yssel, and the Leck, besides lesser streams. In 1079, it was raised to a county by the emperor Henry IV. and in 1339 to a duchy by the emperor Louis of Bavaria. It had dukes of its own till 1528, when it was yielded up to the emperor Charles V. In 1579, it acceded to the union of Utrecht. It is divided into three districts, each of which has its states and diets. Those for the whole province are held twice a-year at the capital towns. The province sends 19 deputies to the states-general. Here are computed 285 Calvinist ministers, 14 Roman Catholic congregations, 4 of the Lutheran persuasion, besides 3 others of Romonstrants and Anabaptists. The places of most note are Nimeguen, Zutphen, Arnheim, Harderwyk, Loo, &c.

GUELDRÉS, a strong town of the Netherlands, in the duchy of the same name. It was ceded to the king of Prussia by the peace of Utrecht, and is seated among marshes. E. Long. 6. 21. N. Lat. 51. 30.

GUERCINO. See BARBIERI.

GUERICKE, or GUERICHE, (Otho), the most celebrated mathematician of his time, was born in 1602. He was the inventor of the air pump; and author of several works in natural philosophy, the chief of which is *Experimenta Magdeburgica*. He died in 1686.

GUERNSEY, an island in the English channel, on the coast of Normandy, subject to Britain; but (as well as the adjacent islands) governed by its own laws. See JERSEY. It extends from east to west in the form of a harp, and is thirteen miles and a half from the

south-west to north-east, and twelve and a half, where broadest, from east to west. The air is very healthy, and the soil naturally more rich and fertile than that of Jersey; but the inhabitants neglect the cultivation of the land for the sake of commerce: they are, however, sufficiently supplied with corn and cattle, both for their own use and that of their ships. The island is well fortified by nature with a ridge of rocks, one of which abounds with emery, used by lapidaries in the polishing of stones, and by various other artificers. Here is a better harbour than any in Jersey, which occasions its being more resorted to by merchants; and on the south-side the shore bends in the form of a crescent, enclosing a bay capable of receiving very large ships. The island is full of gardens and orchards; whence cyder is so plentiful, that the common people use it instead of small-beer, but the more wealthy drink French wine.

GUETTARDA, in botany: A genus of the heptandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, *Tricocœa*. The male calyx is cylindrical; the corolla cleft into seven parts, and funnel-shaped. The female calyx cylindrical; the corolla cleft into seven parts; one pistil, and the fruit a dry plum.

GUIANA, a large country of South America, is bounded on the east and north by the Atlantic ocean, and the river Oroonoko; on the south, by the river of the Amazons; and on the west, by the provinces of Grenada and New-Andalusia, in Terra-Firma, from which it is separated both on the west and north by the river Oroonoko. It extends above 1200 miles from the north-east to the south-west, that is, from the mouth of the river Oroonoko to the mouth of the river of Amazons, and near 600 in the contrary direction.

Most geographers divide it into two parts, calling the country along the coast *Carribbeano Proper*, and the interior country *Guiana Proper*: the last is also styled *El Dorado* by the Spaniards, on account of the immense quantity of gold it is supposed to contain.

The Portuguese, French, and Dutch, have all settlements along the coast. What lies south of Cape North belongs to the first of these nations; the coast between Cape North and Cape Orange is possessed by the natives; French Guiana, Old Cayenne, or Equinoctial France, extends from Cape Orange, about 240 miles along the coast, to the river Marani; where the Dutch territory begins, and extends to the mouth of the Oroonoko.

Along the coast, the land is low, marshy, and subject to inundations in the rainy season, from a multitude of rivers which descend from the inland mountains. Hence it is, that the atmosphere is suffocating, hot, moist, and unhealthful, especially where the woods have not been cleared away. Indeed, the Europeans are forced to live in the most disagreeable situations, and fix their colonies at the mouths of the rivers, amidst stinking marshes, and the putrid ooze of salt morasses, for the convenience of exportation and importation.

“Dutch Guiana (according to an account lately published by a gentleman who resided several years at Surinam as a physician) was first discovered by Columbus in 1498. It lies between the 7° of north and

Guettarda
Guiana.

Guiana. and the 5° of south latitude, and between the 53° and 60° of longitude west from London. It is bounded on the north and east, by the Atlantic; on the west, by the rivers Oroonoko and Negroe; and on the south, by the river of Amazons.

"It is now divided between the Spaniards, Dutch, French, and Portuguese; but, except its sea-coast, and lands adjacent to its rivers, it has hitherto remained unknown to all but its original natives; and even of these, it is only the Dutch territories that foreigners have any knowledge of; for those of the Spaniards, French, and Portuguese, are inaccessible to them.

"This country, on account of the diversity and fertility of its soil, and of its vicinity to the equator, which passes through it, affords almost all the productions of the different American countries between the tropics, besides a variety peculiar to itself."

Dutch Guiana was formerly the property of the English, who made settlements at Surinam, where a kind of corrupt English is still spoken by the negroes. The Dutch took it in the reign of Charles the Second; and it was ceded to them by a treaty in 1674, in exchange for what they had possessed in the province now called *New York*.

The land for 50 miles up the country from the sea-coast is flat; and, during the rainy seasons, covered two feet high with water. This renders it inconceivably fertile, the earth, for 12 inches deep, being a stratum of perfect manure: an attempt was once made to carry some of it to Barbadoes; but the wood-ants so much injured the vessel, that it was never repeated. The excessive richness of the soil is a disadvantage, for the canes are too luxuriant to make good sugar; and therefore, during the first and second crop, are converted into rum.

There are some trees on this part; but they are small and low, consisting chiefly of a small species of palm, intermixed with a leaf near 30 feet long and three feet wide, which grows in clusters, called a *Troalie*; and, at the edges of running-water, with mangroves.

Farther inward the country rises; and the soil, though still fertile, is less durable. It is covered with forests of valuable timber, that are always green; and there are some sandy hills, though no mountains; in the French territories, however, there are mountains, according to the report of the Indians, for they have never been visited by any other people.

In this country the heat is seldom disagreeable: the trade-winds by day, the land breezes in the evening, and the invariable length of the nights, with gentle dews, refresh the air, and render it temperate and salubrious. There are two wet seasons and two dry, of three months each, in every year; and, during more than a month in each wet season, the rain is incessant. The dry seasons commence six weeks before the equinoxes, and continue six weeks after. The wet seasons are more wholesome than the dry, because the rains keep the waters that cover the low lands, next the sea, fresh and in motion; but during the dry season it stagnates, and, as it wastes, becomes putrid, sending up very unwholesome exhalations. Blossoms, green and ripe fruit, are to be found upon the same tree in every part of the year. There are

some fine white and red agates in Guiana, which remain untouched; and mines of gold and silver, which the Dutch will not suffer to be wrought.

The inhabitants of Guiana are either natives, who are of a reddish brown; or negroes and Europeans; or a mixed progeny of these in various combinations. The natives are divided into different tribes, more or less enlightened and polished, as they are more or less remote from the settlements of the Europeans. They allow polygamy, and have no division of lands. The men go to war, hunt, and fish; and the women look after domestic concerns, spin, weave in their fashion, and manage the planting of cassava and manive, the only things which in this country are cultivated by the natives. Their arms are bows and arrows; sharp poisoned arrows, blown through a reed, which they use in hunting; and clubs made of a heavy wood called *Iron-wood*. They eat the dead bodies of those that are slain in war; and sell for slaves those they take prisoners; their wars being chiefly undertaken to furnish the European plantations. All the different tribes go naked. On particular occasions they wear caps of feathers; but, as cold is wholly unknown, they cover no part but that which distinguishes the sex. They are cheerful, humane, and friendly; but timid, except when heated by liquor, and drunkenness is a very common vice among them.

Their houses consist of four stakes set up in a quadrangular form, with cross poles, bound together by slit nibbees, and covered with the large leaves called *troalies*. Their life is ambulatory; and their house, which is put up and taken down in a few hours, is all they have to carry with them. When they remove from place to place, which, as they inhabit the banks of rivers, they do by water in small canoes, a few vessels of clay made by the women, a flat stone on which they bake their bread, and a rough stone on which they grate the roots of the cassava, a hammock and a hatchet, are all their furniture and utensils; most of them, however, have a bit of looking-glass framed in paper, and a comb.

Their poisoned arrows are made of splinters of a hard heavy wood, called *cacario*; they are about 12 inches long, and somewhat thicker than a coarse knitting needle: one end is formed into a sharp point; round the other is wound some cotton, to make it fit the bore of the reed through which it is to be blown. They will blow these arrows 40 yards with absolute certainty of hitting the mark, and with force enough to draw blood, which is certain and immediate death. Against this poison no antidote is known. The Indians never use these poisoned arrows in war, but in hunting only, and chiefly against the monkeys; the flesh of an animal thus killed may be safely eaten, and even the poison itself swallowed with impunity.

GUIAQUIL, a town, bay, and harbour of South America, in Peru, and capital of an audience of the same name. W. Long. 76. 55. S. Lat. 2. 0.

GUIARA, a sea-port town of South America, and on the Caracca coast. The English attempted to take it in 1739 and 1743; but they were repulsed both times. W. Long. 66. 5. N. Lat. 10. 35.

GUICCIARDINI (Francisco), a celebrated historian, born at Florence in 1482. He professed the civil law with reputation, and was employed in several

Guiana

dini.

Guicciar-
dini
||
Guidons.

ral embassies. Leo X. gave him the government of Modena and Reggio, and Clement VII. that of Romagna and Bologna. Guicciardini was also lieutenant-general of the pope's army, and distinguished himself by his bravery on several occasions; but Paul III. having taken from him the government of Bologna, he retired to Florence, where he was made counsellor of state, and was of great service to the house of Medicis. He at length retired into the country to write his history of Italy, which he composed in Italian, and which comprehends what passed from the year 1494 to 1532. This history is greatly esteemed; and was continued by John Baptist Adriani, his friend. He died in 1540.

GUICCIARDINI (Lewis), his nephew, composed a history of the Low Countries, and memoirs of the affairs of Europe, from 1530 to 1560. He wrote with great spirit against the persecution of the duke d'Alva, for which he imprisoned him. Died in 1583.

GUIDES, in military language, are usually the country people in the neighbourhood of an encampment; who give the army intelligence concerning the country, the roads by which they are to march, and the probable route of the enemy.

GUIDI (Alexander), an eminent Italian poet, born at Pavia in 1650. Having a desire to see Rome, he there attracted the notice of queen Christina of Sweden, who retained him at her court; he beside obtained a considerable benefice from pope Innocent XI. and a pension from the duke of Parma. For a good office he did the state of Milan with prince Eugene, he was enrolled among the nobles and decorations of that town; and died in 1712. Nature had been kinder to his intellects than to his exterior form; his body was small and crooked, his head was large, and he was blind of his right eye. A collection of his works was published at Verona in 1726.

GUIDO ARETIN. See ARETIN.

GUIDO (Reni), an illustrious Italian painter, born at Bologna in 1595. In his early age he was the disciple of Denis Calvert, a Flemish master of good reputation; but afterwards entered himself in the school of the Caracci. He first imitated Ludovico Caracci; but fixed at last in a peculiar style of his own, that secured him the applause of his own time and the admiration of posterity. He was much honoured, and lived in splendor; but an unhappy attachment to gaming ruined his circumstances; the reflection of which brought on a languishing disorder, that put an end to his life in 1642. There are several designs of this great master in print, etched by himself.

GUIDON, a sort of flag or standard borne by the king's life-guard; being broad at one extreme, and almost pointed at the other, and slit or divided into two. The guidon is the ensign or flag of a troop of horse-guards. See GUARD.

GUIDON also denotes the officer who bears the guidon. The guidon is that in the horse-guards which the ensign is in the foot. The guidon of a troop of horse takes place next below the cornet.

GUIDONS, *guidones*, or *schola guidonum*, was a company of priests established by Charlemagne, at Rome, to conduct and guide pilgrims to Jerusalem, to visit

Nº 145.

the holy places: they were also to assist them in case they fell sick, and to perform the last offices to them in case they died.

Guienne,
Guilandina.

GUIENNE, the largest province of France, bounded on the north by Saintogne, Angoumois, and Limosin; on the east by Limosin, Auvergne, and Languedoc; on the south by the Pyrenees, Lower Navarre, and Bearn; and on the west by the ocean. It is about 225 miles in length, and 200 in breadth. It is divided into the Upper and Lower. The Upper comprehends Querci, Rouergue, Armagnac, the territory of Comminges, and the county of Bigorre. The Lower contains Bourdelois, Perigord, Agenois, Condomois, Bazadois, the Lander, Proper Gascony, and the district of Labour. The principal rivers are, the Garonne, the Adour, the Tarn, the Aveyron, and the Lot. Bourdeaux is the capital town.

GUILANDINA, the NICKAR TREE: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 33d order, *Lomentaceæ*. The calyx is monophyllous and salver-shaped; the petals, inserted into the neck of the calyx, nearly equal. The seed-vessel a legumen.

Species. 1. The bonduc, or yellow nickar. 2. The bonducella, or gray nickar. These are climbing plants, natives of the West Indies, where they rise to the height of twelve or fourteen feet: the flowers come out at the wings of the stalks; and are composed of five concave yellow petals. They are succeeded by pods about three inches long and two broad, closely armed with slender spines, opening with two valves, each inclosing two hard seeds about the size of childrens marbles, of a yellowish colour. 3. The moringa, or morunga nickar, is a native of the island of Ceylon, and some places on the Malabar coast. It rises to the height of 25 or 30 feet, having flowers produced in loose bunches from the side of the branches, and composed of an unequal number of petals.

Culture and Uses. These plants being natives of warm climates, require to be kept through the winter in a stove in this country. They are propagated by seeds; but those of the first sort are so hard, that unless they are soaked two or three days in water before they are put into the ground, or placed under the pots in the tan-bed to soften their covers, they will remain for years without vegetating.—The roots of the third sort are scraped when young, and used by the inhabitants of Ceylon and Malabar as those of horse-radish are in Europe. The wood dyes a beautiful blue colour. It is the *lignum nephriticum*, or nephritic wood, of the dispensaries; and is brought over in large, compact, ponderous pieces, without knots, of a whitish or pale yellow colour on the outside, and dark coloured or reddish within: the bark is usually rejected. This wood imparts to water or rectified spirit a deep tincture; appearing, when placed between the eye and the light, of a golden colour; in other situations blue: pieces of another wood are sometimes mixed with it, which give only a yellow colour to water. The nephritic wood has scarce any smell, and very little taste. It stands recommended in difficulty of urine, nephritic complaints, and all disorders of the kidneys and urinary passages; and is said to have this peculiar advan-

Guild
||
Guildford.

advantage, that it does not, like the warmer diuretics, heat or offend the parts. Practitioners, however, have not found these virtues warranted by experience.

GUILD, (from the Saxon *gildan*, to "pay"), signifies a fraternity or company, because every one was *gildare*, i. e. to pay something towards the charge and support of the company. As to the original of these guilds or companies: It was a law among the Saxons, that every freeman of fourteen years of age should find sureties to keep the peace, or be committed: upon which certain neighbours, consisting of ten families, enter into an association, and became bound for each other, either to produce him who committed an offence, or to make satisfaction to the injured party: that they might the better do this, they raised a sum of money among themselves, which they put into a common stock; and when one of their pledges had committed an offence, and was fled, then the other nine made satisfaction out of this stock, by payment of money, according to the offence. Because this association consisted of ten families, it was called a *decennary*: and from hence came out later kinds of fraternities. But as to the precise time when these guilds had their origin in England, there is nothing of certainty to be found; since they were in use long before any formal licence was granted to them for such meetings. It seems to have been about the close of the eleventh century, says Anderson, in his *History of Commerce*, vol. i. p. 70, that merchant-guilds, or fraternities, which were afterwards styled corporations, came first into general use in many parts of Europe. Mr Madox, in his *Firma Burgi*, chap. i. § 9. thinks, they were hardly known to our Saxon progenitors, and that they might be probably brought into England by the Normans; although they do not seem to have been very numerous in those days. The French and Normans might probably borrow them from the free cities of Italy, where trade and manufactures were much earlier propagated, and where possibly such communities were first in use. These guilds are now companies joined together, with laws and orders made by themselves, by the licence of the prince.

GUILD, in the royal boroughs of Scotland, is still used for a company of merchants, who are freemen of the borough. See BOROUGH.

Every royal borough has a dean of *guild*, who is the next magistrate below the bailiff. He judges of controversies among men concerning trade; disputes between inhabitants touching buildings, lights, water-courses, and other nuisances; calls courts, at which his brethren of the *guild* are bound to attend; manages the common stock of the *guild*; and amerces and collects fines.

GUILD, *Gild*, or *Geld*, is also used among our ancient writers, for a compensation or mulct, for a fault committed.

GUILD-Hall, or *Gild-Hall*, the great court of judicature for the city of London. In it are kept the mayor's court, the sheriff's court, the court of hustings, court of conscience, court of common council, chamberlain's court, &c. Here also the judges sit upon *nisi prius*, &c.

GUILDFORD, or GULDEFORD, a borough-town of Surry, situated on the river Wye, thirty-one miles south-west of London. Near it are the ruinous walls

VOL. VIII. Part I.

of an old castle, this having been in the Saxon times a royal villa, where many of our kings used to pass the festivals. Here is a corporation consisting of a mayor, recorder, alderman, &c. which sent members to parliament ever since parliament had a being. The great road from London to Chichester and Portsmouth lies through this town, which has always been famous for good inns, the cleanest of linen, and other excellent accommodations; and the assizes are often held here. Its manufactory formerly was cloth, of which there are still some small remains. Here is a school founded by king Edward VI. also an almshouse endowed with lands worth 300 l. a-year, of which 100 l. to be employed in setting the poor at work, and the other 200 l. for the maintenance of a master, 12 brethren, and 8 sisters, who are to have 2s. 6d. a-week. There are, besides, two charity schools for 30 boys and 20 girls. There were three churches in this town, but one of them fell down in April 1740. There is a fine circular course for horse-matches, which begin when the Newmarket races are ended. King William III. founded a plate of 100 guineas to be run for here every May, and used to honour the race with his presence, as did once king George I. The river Wey is made navigable to the town, and by it a great quantity of timber is carried to London, not only from this neighbourhood, but from Sussex and Hampshire woods, above 30 miles off, from whence it is brought hither in the summer by land carriage. This navigation is also of great support to Farnham market, corn bought there being brought to the mills on this river within seven miles distance, and, after being ground and dressed, is sent down in barges to London. The road from hence to Farnham is very remarkable, for it runs along upon the ridge of a high chalky hill, called *St Catharine's*, no wider than the road itself, from whence there is an extensive prospect, viz. to the N. and N. W. over Bagshot-Heath, and the other way into Sussex, and almost to the South Downs. The town sends two members to parliament; and gives title of earl to the North family.

GUILLEMOT, in ornithology. See COLYMBUS.

GUILLIM, (John), of Welsh extraction, was born in Herefordshire, about the year 1565. Having completed his education at Brazen-nose college, Oxford, he became a member of the college of arms in London; and was made rouge croix pursuivant, in which post he died in 1621. He published, in 1610, a celebrated work, intitled *the Display of Heraldry*, folio, which has gone through many editions. To the fifth, which came out in 1679, was added *A treatise of honour civil and military*, by captain John Loggan.

GUINEA, a large tract of country lying on the west side of the continent of Africa, extends along the coast three or four thousand miles, beginning at the river Senegal, situated about the 17th degree of north latitude (being the nearest part of Guinea as well to Europe as to North America). From that river to the river Gambia, and in a southerly course to Cape Sierra Leona, is comprehended a coast of about 700 miles; being the same tract for which Queen Elizabeth granted charters to the first traders to that coast. From Sierra Leona, the land of Guinea takes a turn to the eastward, extending that course about 1500 miles, including those several divisions known by the names of the *Grain Coast*, the *Ivory Coast*, the *Gold Coast*, and the

Guinea.

Y

Slave

Guinea. *Slave Coast*, with the large kingdom of *Benin*. From thence the land runs southward along the coast about 1200 miles, which contains the kingdoms of *Congo* and *Angola*; where the trade for slaves ends. From which to the southernmost cape of Africa, called the *Cape of Good Hope*, the country is settled by *Caffres* and *Hottentots*, who have never been concerned in the making or selling slaves.

* *Astley's*
Collect.
vol. ii.
p. 46.

1. Of the parts which are above mentioned, the first is that situated on the great river *Senegal*, which is said to be navigable more than 1000 miles, and is by travellers described to be very agreeable and fruitful. Mr *Brue*, principal factor for the French African company, who lived 16 years in that country, after describing its fruitfulness and plenty near the sea, adds *, "The farther you go from the sea, the country on the river seems the more fruitful and well improved, abounding with Indian corn, pulse, fruit, &c. Here are vast meadows, which feed large herds of great and small cattle, and poultry numerous: the villages that lie thick on the river, show the country is well peopled." The same author, in the account of a voyage he made up the river *Gambia*, the mouth of which lies about 300 miles south of the *Senegal*, and is navigable about 600 miles up the country, says,

† *Voyage to*
Guinea,
p. 31, 34.

"that he was surprized to see the land so well cultivated; scarce a spot lay unimproved; the low lands divided by small canals were all sowed with rice, &c. the higher ground planted with millet, Indian corn, and pease of different sorts; their beef excellent; poultry plenty and very cheap, as well as all other necessaries of life." Mr *Moor*, who was sent from England about the year 1735, in the service of the African company, and resided at *James Fort* on the river *Gambia*, or in other factories on that river, about five years, confirms the above account of the fruitfulness of the country. Captain *Smith*, who was sent in the year 1726 by the African company to survey their settlements throughout the whole coast of *Guinea*, says†, "the country about the *Gambia* is pleasant and fruitful; provisions of all kinds being plenty and exceeding cheap." The country on and between the two above mentioned rivers is large and extensive, inhabited principally by those three Negro nations known by the name of *Jalofs*, *Fulis*, and *Mandingos*. The *Jalofs* possess the middle of the country. The *Fulis* principal settlement is on both sides of the *Senegal*: great numbers of these people are also mixed with the *Mandingos*; which last are mostly settled on both sides the *Gambia*. The government of the *Jalofs* is represented as under a better regulation than can be expected from the common opinion we entertain of the negroes. We are told in *Astley's Collection*, "That the king has under him several ministers of state, who assist him in the exercise of justice. The grand *Jerafo* is the chief justice through all the king's dominions, and goes in circuit from time to time to hear complaints and determine controversies. The king's treasurer exercises the same employment, and has under him *alkairs*, who are governors of towns or villages. That the *kondi*, or viceroy, goes the circuit with the chief justice, both to hear causes and inspect into the behaviour of the *alkadi*, or chief magistrate of every village in their several districts." *Vasconcelas*, an author mentioned in the *Collection*, says,

"the ancientest are preferred to be the prince's counsellors, who keep always about his person; and the men of most judgment and experience are the judges." The *Fulis* are settled on both sides of the river *Senegal*: their country, which is very fruitful and populous, extends near 400 miles from east to west. They are generally of a deep tawny complexion, appearing to bear some affinity to the *Moors*, whose country they join on the north: they are good farmers, and make great harvest of corn, cotton, tobacco, &c. and breed great numbers of cattle of all kinds. But the most particular account we have of these people is from *Moore*, who says*, "Some of these *Fuli* blacks, who dwell on both sides the river *Gambia*, are in subjection to the *Mandingos*, amongst whom they dwell, having been probably driven out of their country by war or famine. They have chiefs of their own, who rule with much moderation. Few of them will drink brandy, or any thing stronger than water and sugar, being strict *Mahometans*. Their form of government goes on easy, because the people are of a good quiet disposition, and so well instructed in what is right, that a man who does ill is the abomination of all, and none will support him against the chief. In these countries the natives are not covetous of land, desiring no more than what they use; and as they do not plough with horses and cattle, they can use but very little; therefore the kings are willing to give the *Fulis* leave to live in their country, and cultivate their lands. If any of their people are known to be made slaves, all the *Fulis* will join to redeem them; they also support the old, the blind, and lame, amongst themselves; and as far as their abilities go, they supply the necessities of the *Mandingos*, great numbers of whom they have maintained in famine." The author, from his own observations, says, "They were rarely angry, and that he never heard them abuse one another."

* *Travels*
into distant
parts of
Africa,
p. 198.

The *Mandingos* are said by Mr *Brue* before mentioned, "to be the most numerous nation on the *Gambia*, besides which, numbers of them are dispersed over all these countries; being the most rigid *Mahometans* amongst the negroes, they drink neither wine nor brandy, and are politer than the other negroes. The chief of the trade goes through their hands. Many are industrious and laborious, keeping their ground well cultivated, and breeding a good stock of cattle†. Every town has an *alkadi*, or governor, who has great power; for most of them having two common fields of clear ground, one for corn, and the other for rice, the *alkadi* appoints the labour of all the people. The men work the corn ground, and the women and girls the rice ground; and as they all equally labour, so he equally divides the corn amongst them; and in case any are in want, the others supply them. This *alkadi* decides all quarrels, and has the first voice in all conferences in town affairs." Some of these *Mandingos*, who are settled at *Galem*, far up the river *Senegal*, can read and write Arabic tolerably; and are a good hospitable people, who carry on a trade with the inland nations. "They are extremely populous in those parts, their women being fruitful, and they not suffering any person amongst them, but such as are guilty of crimes, to be made slaves." We are told from *Jobson*, "That the *Mahometan* Negroes say their prayers thrice a day. Each village has

† *Astley's*
Collect.
p. 296.

Guinea. has a priest who calls them to their duty. It is surprising (says the author), as well as commendable, to see the modesty, attention, and reverence they observe during their worship. He asked some of their priests the purport of their prayers and ceremonies; their answer always was, "that they adored God by prostrating themselves before him; that by humbling themselves, they acknowledged their own insignificance, and farther intreated him to forgive their faults, and to grant them all good and necessary things, as well as deliverance from evil." Jobson takes notice of several good qualities in these negro priests, particularly their great sobriety. They gain their livelihood by keeping school for the education of the children. The boys are taught to read and write. They not only teach school, but rove about the country, teaching and instructing, for which the whole country is open to them; and they have a free course through all places, though the kings may be at war with one another.

The three fore-mentioned nations practise several trades, as smiths, potters, saddlers, and weavers. Their smiths particularly work neatly in gold and silver, and make knives, hatchets, reaping hooks, spades, and shares to cut iron, &c. Their potters make neat tobacco pipes, and pots to boil their food. Some authors say that weaving is their principal trade: this is done by the women and girls, who spin and weave very fine cotton cloth, which they dye blue or black. Moore says, the Jalofs particularly make great quantities of the cotton cloth; their pieces are generally 27 yards long, and about nine inches broad, their looms being very narrow; these they sew neatly together, so as to supply the use of broad cloth.

It was in these parts of Guinea that M. Adanson, correspondent of the Royal Academy of Sciences at Paris, was employed from the year 1749 to the year 1753, wholly in making natural and philosophical observations on the country about the rivers Senegal and Gambia. Speaking of the great heats in Senegal, he says †, "it is to them that they are partly indebted for the fertility of their lands; which is so great, that, with little labour and care, there is no fruit nor grain but grows in great plenty."

† Voyage to
Senegal, &c.
p. 308.

Of the soil on the Gambia, he says, "it is rich and deep, and amazingly fertile; it produces spontaneously, and almost without cultivation, all the necessaries of life, grain, fruit, herbs, and roots. Every thing matures to perfection, and is excellent in its kind." One thing which always surprized him, was the prodigious rapidity with which the sap of trees repairs any loss they may happen to sustain in that country; "And I was never (says he) more astonished, than when landing four days after the locusts had devoured all the fruits and leaves, and even the buds of the trees, to find the trees covered with new leaves, and they did not seem to me to have suffered much." "It was then (says the same author) the fish season; you might see them in shoals approaching towards land. Some of those shoals were 50 fathoms square, and the fish crowded together in such a manner, as to roll upon one another, without being able to swim. As soon as the negroes perceive them coming towards land, they jump into the water with a basket in one hand, and swim with the other. They need only to plunge

and to lift up their basket, and they are sure to return loaded with fish." Speaking of the appearance of the country, and of the disposition of the people, he says, "which way soever I turned mine eyes on this pleasant spot, I beheld a perfect image of pure nature; an agreeable solitude, bounded on every side by charming landscapes; the rural situation of cottages in the midst of trees; the ease and indolence of the negroes, reclined under the shade of their spreading foliage; the simplicity of their dress and manners; the whole revived in my mind the idea of our first parents, and I seemed to contemplate the world in its primitive state. They are, generally speaking, very good-natured, sociable, and obliging. I was not a little pleased with this my first reception; it convinced me, that there ought to be a considerable abatement made in the accounts I had read and heard every where of the savage character of the Africans. I observed, both in the negroes and moors great humanity and sociableness, which gave me strong hopes that I should be very safe amongst them, and meet with the success I desired in my inquiries after the curiosities of the country." He was agreeably amused with the conversation of the negroes, their fables, dialogues, and witty stories with which they entertain each other alternately, according to their custom. Speaking of the remarks which the natives made to him with relation to the stars and planets, he says, "it is amazing, that such a rude and illiterate people should reason so pertinently in regard to those heavenly bodies; there is no manner of doubt, but that with proper instruments, and a good will, they would become excellent astronomers."

2. That part of Guinea known by the name of the *Grain and Ivory Coast* extends about 500 miles. The soil is said to be in general fertile, producing abundance of rice and roots; indigo and cotton thrive without cultivation, and tobacco would be excellent if carefully manufactured; they have fish in plenty; their flocks greatly increase; and their trees are loaded with fruit. They make a cotton cloth, which sells well on the coast. In a word, the country is rich, and the commerce advantageous, and might be greatly augmented by such as would cultivate the friendship of the natives. These are represented by some writers as a rude, treacherous people; whilst several other authors of credit give them a very different character, describing them as sensible, courteous, and the fairest traders on the coast of Guinea. In the Collection, they are said † to be averse to drinking to excess, and such as do are severely punished by the king's order. On inquiry why there is such a disagreement in the character given of these people, it appears, that though they are naturally inclined to be kind to strangers, with whom they are fond of trading, yet the frequent injuries done them by Europeans have occasioned their being suspicious and shy: the same cause has been the occasion of the ill treatment they have sometimes given to innocent strangers, who have attempted to trade with them. As the Europeans have no settlement on this part of Guinea, the trade is carried on by signals from the ships, on the appearance of which the natives usually come on board in their canoes, bringing their gold-dust, ivory, &c. which has given opportunity to some villanous Europeans to carry them off with their effects, or retain them on board till a ran-

Guinea.

† Vol. ii.
p. 560.

Guinea som is paid. It is noted by some, that since the European voyagers have carried away several of these people, their mistrust is so great, that it is very difficult to prevail on them to come on board. Smith remarks, "As we past along this coast, we very often lay before a town, and fired a gun for the natives to come off; but no soul came near us: at length we learnt by some ships that were trading down the coast, that the natives came seldom on board an English ship, for fear of being detained or carried off: yet at last some ventured on board; but if these chanced to spy any arms, they would all immediately take to their canoes, and make the best of their way home. They had then in their possession one Benjamin Cross, the mate of an English vessel, who was detained by them to make reprisals for some of their men, who had formerly been carried away by some English vessel." In the Collection we are told, "This villanous custom is too often practised, chiefly by the Bristol and Liverpool ships, and is a great detriment to the slave trade on the windward coast." John Snock, mentioned in Bosman †, when on the coast, wrote, "We cast anchor, but not one negro coming on board, I went on shore; and after having staid a while on the strand, some negroes came to me; and being desirous to be informed why they did not come on board, I was answered, that about two months before, the English had been there with two large vessels, and had ravaged the country, destroyed all their canoes, plundered their houses, and carried off some of their people, upon which the remainder fled to the inland country, where most of them were at that time; so that there being not much to be done by us, we were obliged to return on board. When I inquired after their wars with other countries, they told me they were not often troubled with them; but if any difference happened, they chose rather to end the dispute amicably than to come to arms.†" He found the inhabitants civil and good-natured. Speaking of the king of Rio Sestro, lower down the coast, he says, "He was a very agreeable, obliging man; and all his subjects are civil, as well as very laborious in agriculture and the pursuits of trade." Marchais ‡ says, "That though the country is very populous, yet none of the natives (except criminals) are sold for slaves." Vaillant never heard of any settlement being made by the Europeans on this part of Guinea; and Smith remarks§, "That these coasts, which are divided into several little kingdoms, and have seldom any wars, is the reason the slave trade is not so good here as on the Gold and Slave Coast, where the Europeans have several forts and factories." A plain evidence this, that it is the intercourse with the Europeans, and their settlements on the coast, which gives life to the slave trade.

3. Next adjoining to the Ivory Coast are those called the *Gold Coast* and the *Slave Coast*; authors are not agreed about their bounds, but their extent together along the coast may be about 500 miles. And as the policy, produce, and economy of these two kingdoms of Guinea are much the same, they shall be described together.

Here the Europeans have the greatest number of forts and factories; from whence, by means of the negro factors, a trade is carried on above 700 miles back in the inland country; whereby great numbers of slaves

are procured, as well by means of the wars which arise amongst the negroes, or are fomented by the Europeans, as those brought from the back country. Here we find the natives more reconciled to the European manners and trade; but, at the same time, much more inured to war, and ready to assist the European traders in procuring loadings for the great number of vessels which come yearly on those coasts for slaves. This part of Guinea is agreed by historians to be, in general, extraordinary fruitful and agreeable; producing (according to the difference of the soil) vast quantities of rice and other grain, plenty of fruit and roots, palm wine and oil, and fish in great abundance, with much tame and wild cattle. Bosman, principal factor for the Dutch at D'Elmina, speaking of the country of Axim, which is situated towards the beginning of the Gold Coast, says, "The negro inhabitants are generally very rich, driving a great trade with the Europeans for gold: That they are industriously employed either in trade, fishing, or agriculture; but chiefly in the culture of rice, which grows here in an incredible abundance, and is transported hence all over the Gold Coast: the inhabitants, in lieu, returning full fraught with millet, jamms, potatoes, and palm oil." The same author, speaking of the country of Ante, says, "This country, as well as the Gold Coast, abounds with hills, enriched with extraordinary high and beautiful trees; its valleys, betwixt the hills, are wide and extensive, producing in great abundance very good rice, millet, jamms, potatoes, and other fruits, all good in their kind." He adds, "In short, it is a land that yields its manurers as plentiful a crop as they can wish, with great quantities of palm wine and oil, besides being well furnished with all sorts of tame as well as wild beasts; but that the last fatal wars had reduced it to a miserable condition, and stripped it of most of its inhabitants." The adjoining country of Fetu, he says, "was formerly so powerful and populous, that it struck terror into all the neighbouring nations; but it is at present so drained by continual wars, that it is entirely ruined; there does not remain inhabitants sufficient to till the country, though it is so fruitful and pleasant that it may be compared to the country of Ante just before described; frequently (says our author), when walking through it before the last war, I have seen it abound with fine well built and populous towns, agreeably enriched with vast quantities of corn, cattle, palm wine, and oil. The inhabitants all applying themselves without any distinction to agriculture; some sow corn, others press oil, and draw wine from palm trees, with both which it is plentifully stored."

Smith gives much the same account of the before mentioned parts of the Gold Coast; and adds, "the country about D'Elmina and Cape Coast is much the same for beauty and goodness, but more populous; and the nearer we come towards the Slave Coast, the more delightful and rich all the countries are, producing all sorts of trees, fruits, roots, and herbs, that grow within the torrid zone." Barbot also remarks*, with respect to the countries of Ante and Adom, "That the soil is very good and fruitful in corn and other produce; which it affords in such plenty, that besides what serves for their own use, they always export great quantities for sale: they have a competent number of cattle, both tame and wild, and the rivers abundantly stored.

Guinea.

stored with fish; so that nothing is wanting for the support of life, and to make it easy." In the Collection it is said "That the inland people on that part of the coast employ themselves in tillage and trade, and supply the market with corn, fruit, and palm wine; the country producing such vast plenty of Indian corn, that abundance is daily exported, as well by Europeans as blacks resorting thither from other parts." These inland people are said to live in great union and friendship, being generally well tempered, civil, and tractable; not apt to shed human blood, except when much provoked; and ready to assist one another. In the Collection it is said, "That the fishing business is esteemed on the Gold Coast next to trading; that those who profess it are more numerous than those of other employments. That the greatest number of these are at Kommendo, Mina, and Kormantin; from each of which places, there go out every morning (Tuesday excepted, which is the Fetish day, or day of rest) five, six, and sometimes eight hundred canoes, from 13 to 14 feet long, which spread themselves two leagues at sea, each fisherman carrying in his canoe a sword, with bread, water, and a little fire on a large stone to roast fish. Thus they labour till noon, when the sea breeze blowing fresh, they return on the shore, generally laden with fish; a quantity of which the inland inhabitants come down to buy, which they sell again at the country markets."

Smith says, "The country about Acra, where the English and Dutch have each a strong fort, is very delightful, and the natives courteous and civil to strangers." He adds, "That this place seldom fails of an extraordinary good trade from the inland country, especially for slaves, whereof several are supposed to come from very remote parts, because it is not uncommon to find a Malayan or two amongst a parcel of other slaves: The Malaya people are generally natives of Malacca, in the East Indies, situated several thousand miles from the Gold Coast." They differ very much from the Guinea negroes, being of a tawny complexion, with long black hair.

Most parts of the slave coasts are represented as equally fertile and pleasant with the gold coast. The kingdom of Whidah has been particularly noted by travellers. Smith and Bosman agree, "That it is one of the most delightful countries in the world. The great number and variety of tall, beautiful, and shady trees, which seem planted in groves; the verdant fields every where cultivated, and no otherwise divided than by those groves, and in some places a small foot-path, together with a great number of villages, contribute to afford the most delightful prospect; the whole country being a fine, easy, and almost imperceptible ascent for the space of 40 or 50 miles from the sea. That the farther you go from the sea, the more beautiful and populous the country appears. That the natives were kind and obliging, and so industrious, that no place which was thought fertile could escape being planted, even within the hedges which inclose their villages. And that the next day after they had reaped, they sowed again."

Snelgrave also says, "The country appears full of towns and villages; and being a rich soil, and well cultivated, looks like an entire garden." In the Collection, the husbandry of the negroes is described to be carried on with great regularity. "The rainy sea-

Guinea.

son approaching, they go into the fields and woods, to fix on a proper place for sowing; and as here is no property in ground, the king's licence being obtained, the people go out in troops, and first clear the ground from bushes and weeds, which they burn. The field thus cleared, they dig it up a foot deep, and so let it remain for eight or ten days, till the rest of their neighbours have disposed their ground in the same manner. They then consult about sowing, and for that end assemble at the king's court the next fetish day. The king's grain must be sown first. They then go again to the field, and give the ground a second digging, and sow their seed. Whilst "the king or governor's land is sowing, he sends out wine and flesh, ready dressed, enough to serve the labourers. Afterwards, they in like manner sow the ground allotted for their neighbours as diligently as that of the king's, by whom they are also feasted; and so continue to work in a body for the public benefit till every man's ground is tilled and sowed. None but the king, and a few great men, are exempted from this labour. Their grain soon sprouts out of the ground. When it is about a man's height, and begins to ear, they raise a wooden house in the centre of the field, covered with straw, in which they set their children to watch their corn, and fright away the birds."

Bosman speaks in commendation of the civility, kindness, and great industry of the natives of Whidah. This is confirmed by Smith, who says, "The natives here seem to be the most gentleman-like negroes in Guinea, abounding with good manners and ceremony to each other. The inferior pay the utmost deference and respect to the superior, as do wives to their husbands, and children to their parents. All here are naturally industrious, and find constant employment; the men in agriculture, and the women in spinning and weaving cotton. The men, whose chief talent lies in husbandry, are unacquainted with arms; otherwise, being a numerous people, they could have made a better defence against the king of Dahome, who subdued them without much trouble." According to the Collection, there are, throughout the gold coast, regular markets in all villages, furnished with provisions and merchandise, held every day in the week except Tuesday, whence they supply not only the inhabitants, but the European ships. The negro women are very expert in buying and selling, and extremely industrious; for they will repair daily to market from a considerable distance, loaded like pack-horses, with a child perhaps at their back, and a heavy burden on their heads. After selling their wares, they buy fish and other necessaries, and return home loaded as they came. There is a market held at Sabi every fourth day, also a weekly one in the province of Apologua, which is so resorted to, that there are usually 5 or 6000 merchants. Their markets are so well regulated and governed, that seldom any disorder happens; each species of merchandise and merchants have a separate place allotted them by themselves. The buyers may haggle as much as they will, but it must be without noise or fraud. To keep order, the king appoints a judge; who, with four officers well armed, inspects the markets, hear all complaints, and in a summary way decides all differences; he has power

Guinea.

power to seize, and sell as slaves, all who are caught in stealing or disturbing the peace. In these markets are to be sold men, women, children, oxen, sheep, goats, and fowls of all kinds; European cloths, linen and woollen; printed calicoes, silk, grocery ware, china, gold-dust, iron in bars, &c. in a word, most sorts of European goods, as well as the produce of Africa and Asia. They have other markets, resembling our fairs, once or twice a year, to which all the country repair; for they take care to order the day so in different governments as not to interfere with each other."

* Smith,
p. 193.

With respect to government, Smith says*, "that the gold coast and slave coast are divided into different districts, some of which are governed by their chiefs or kings: the others, being more of the nature of a commonwealth, are governed by some of the principal men, called *Caboceros*; who, Bosman says, are properly denominated *civil fathers*, whose province is to take care of the welfare of the city or village, and to appease tumults." But this order of government has been much broken since the coming of the Europeans. Both Bosman and Barbot mention murder and adultery to be severely punished on the coast, frequently by death; and robbery by a fine proportionable to the goods stolen.

The income of some of the kings is large. Bosman says, "that the king of Whidah's revenues and duties on things bought and sold are considerable; he having the tithe of all things sold in the market, or imported into the country." Both the above mentioned authors say, the tax on slaves shipped off in this king's dominions, in some years, amounts to near L. 20,000.

Bosman tells us, the Whidah negroes have a faint idea of a true God, ascribing to him the attributes of almighty power and omnipresence: but God, they say, is too high to condescend to think of mankind; wherefore he commits the government of the world to those inferior deities which they worship." Some authors say, the wisest of these negroes are sensible of their mistake in this opinion; but dare not forsake their own religion, for fear of the populace rising and killing them. This is confirmed by Smith, who says, "that all the natives of this coast believe there is one true God, the author of them and all things; that they have some apprehension of a future state; and that almost every village has a grove, or public place of worship, to which the principal inhabitants, on a set day, resort to make their offerings."

In the Collection it is remarked as an excellency in the Guinea government, "that however poor they may be in general, yet there are no beggars to be found amongst them; which is owing to the care of their chief men, whose province it is to take care of the welfare of the city or village, it being part of their office to see that such people may earn their bread by their labour; some are set to blow the smith's bellows, others to press palm oil, or grind colours for their mats, and sell provision in the markets. The young men are lifted to serve as soldiers, so that they suffer no common beggar." Bosman ascribes a further reason for this good order*, viz. "that when a negro finds he cannot subsist, he binds himself for a certain sum of money, and the master to whom he is bound is obliged to find him necessaries; that the ma-

* Bosman,
p. 119.

ster sets him a sort of task, which is not in the least slavish, being chiefly to defend his master on occasions, or in sowing time to work as much as himself pleases."

Adjoining to the kingdom of Whidah are several small governments, as Coto, great and small Popo, Ardrah, &c. all situated on the slave coast, where the chief trade for slaves is carried on. These are governed by their respective kings, and follow much the same customs with those of Whidah, except that their principal living is on plunder and the slave trade.

4. Next adjoining to the Slave Coast, is the kingdom of Benin, which, though it extends but about 170 miles on the sea, yet spreads so far inland as to be esteemed the most potent kingdom in Guinea. By accounts, the soil and produce appear to be in a great measure like those before described, and the natives are represented as a reasonable good-natured people. Artus says*, "they are a sincere, inoffensive people, and do no injustice either to one another or to strangers." Smith confirms this account, and says, "that the inhabitants are generally very good-natured, and exceeding courteous and civil. When the Europeans make them presents, which in their coming thither to trade they always do, they endeavour to return them doubly." Bosman tells us, "that his countrymen the Dutch, who were often obliged to trust them till they returned the next year, were sure to be honestly paid their whole debts."

There is in Benin a considerable order in government; theft, murder, and adultery, being severely punished. Smith says, "their towns are governed by officers appointed by the king, who have power to decide in civil cases, and to raise the public taxes; but in criminal cases, they must send to the king's court, which is held at the town of Oedo or Great Benin. This town, which covers a large extent of ground, is about 60 miles from the sea." Barbot tells us, "that it contains 30 streets, 20 fathom wide, and almost two miles long, commonly extending in a straight line from one gate to another; that the gates are guarded by soldiers; that in these streets markets are held every day, for cattle, ivory, cotton, and many sorts of European goods. This large town is divided into several wards or districts, each governed by its respective king of a street, as they call them, to administer justice, and to keep good order. The inhabitants are very civil and good natured, condescending to what the Europeans require of them in a civil way." The same author confirms what has been said by others of their justice in the payment of their debts; and adds, "that they, above all other Guineans, are very honest and just in their dealings; and they have such an aversion for theft, that by the law of the country it is punished with death." We are told by the same author, "that the king of Benin is able upon occasion to maintain an army of 100,000 men; but that, for the most part, he does not keep 30,000. See the article BENIN."

5. The last division of Guinea from which slaves are imported, are the kingdoms of Congo and Angola: these lie to the south of Benin, extending with the intermediate land about 1200 miles on the coast. Great numbers of the natives of both these kingdoms profess the Christian religion, which was long since in-

Guinea.

Guinea. introduced by the Portuguese, who made early settlements in that country. See CONGO and ANGOLA.

In the Collection it is said, that both in Congo and Angola, the soil is in general fruitful, producing great plenty of grain, Indian corn, and such quantities of rice, that it hardly bears any price, with fruits, roots, and palm oil in plenty. The natives are generally a quiet people, who discover a good understanding, and behave in a friendly manner to strangers, being of a mild conversation, affable, and easily overcome with reason. In the government of Congo, the king appoints a judge in every particular division, to hear and determine disputes and civil causes; the judges imprison and release, or impose fines, according to the rule of custom; but in weighty matters, every one may appeal to the king, before whom all criminal causes are brought, in which he giveth sentence; but seldom condemneth to death. The town of Leango stands in the midst of four lordships, which abound in corn, fruit, &c. Here they make great quantities of cloth of divers kinds, very fine and curious; the inhabitants are seldom idle; they even make needle-work caps as they walk in the streets. The slave trade is here principally managed by the Portuguese, who carry it far up into the inland countries. They are said to send off from these parts 15,000 slaves each year. At Angola, about the 10th degree of south latitude, ends the trade for slaves.

As all these countries lie between the tropics, the air is excessively hot, especially from the beginning of September to the end of March; which, with the coolness of the nights, the frequent thick, stinking, sulphureous mists, and the periodical rains, when the flat country is overflowed, makes it very unhealthy, especially to Europeans. The natives, however, are little affected with the unwholesome air. According to Barbot, they keep much within doors in tempestuous times; and when exposed to the weather, their skins being suppled and pores closed by daily anointing with palm oil, the weather can make but little impression on them. They generally, therefore, enjoy a good state of health, and are able to procure to themselves a comfortable subsistence, with much less care and toil than is necessary in our more northern climate; which last advantage arises not only from the warmth of the climate, but also from the overflowing of the rivers, whereby the land is regularly moistened and rendered extremely fertile; and being in many places improved by culture, abounds with grain and fruits, cattle, poultry, &c. The earth yields all the year a fresh supply of food: Few cloaths are requisite, and little art necessary in making them, or in the construction of their houses, which are very simple, principally calculated to defend them from the tempestuous seasons and wild beasts; a few dry reeds covered with mats serve for their beds. The other furniture, except what belongs to cookery, gives the women but little trouble; the moveables of the greatest among them amounting only to a few earthen pots, some wooden utensils, and gourds or calabashes; from these last, which grow almost naturally over their huts, to which they afford an agreeable shade, they are abundantly stocked with good clean vessels for most household uses, being of different sizes, from half a pint to several gallons.

The distempers the Europeans are subject to on this coast, are fevers, fluxes, and colics, which are occasioned by indifferent water and bad air; their settlements lying near the coast, where the fogs and steams arising from the ooze and salt-marshes, and the stinking fish the natives dry on the beach, corrupt the air, and render it fatal to the foreigners. The most temperate men find it difficult to preserve their health; but a great many hasten their death by their intemperance, or negligence, exposing themselves to the cold air in the evening, after a very hot day. This sudden change, from one extreme to the other, has often very bad effects in hot climates.

Of mountains in Guinea, the most remarkable are those of Sierra Leon. The principal capes are those of Cape Blanco, Cape Verd, Cape Leon, Cape St Ann's, Cape Palmas, and Cape Three-Points, Cape Formosa, Cape Monte, Cape St John, Cape Lepas, Cape Lede, and Cape Negro. The chief bays are the Cyprian or Cintra Bay, and the Bite of Guinea. Of the rivers, the most considerable are those of Conango and Ambrisi, the Zaara, the Lunde, the Cameron, the Formosa, the Volta, the Sierra Leon, and the Sherbro. All these run from east to west (except the Volta, which runs from north to south), and fall into the Atlantic.

Besides gold, ivory, and slaves, Guinea affords indigo, wax, gum-senega, gum-tragacanth, and a variety of other gums and drugs.

The most ancient account we have of the country History of of the negroes, particularly that part situated on and the Guinea trade. between the two great rivers of Senegal and Gambia, is from the writings of two ancient authors, one an Arabian, and the other a Moor. The first wrote in Arabic about the 12th century. His works, printed in that language at Rome, were afterwards translated into Latin, and printed at Paris under the patronage of the famous Thuanus chancellor of France, with the title of *Geographica Nubiensis*, containing an account of all the nations lying on the Senegal and Gambia. The other was written by John Leo, a Moor, born at Granada in Spain, before the Moors were totally expelled from that kingdom. He resided in Africa; but being on a voyage from Tripoli to Tunis, was taken by some Italian corsairs, who finding him possessed of several Arabian books, besides his own manuscripts, apprehended him to be a man of learning, and as such presented him to Pope Leo X. This pope encouraging him, he embraced the Romish religion, and his description of Africa was published in Italian. From these writings we gather, that after the Mahometan religion had extended to the kingdom of Morocco, some of the promoters of it crossing the sandy deserts of Numidia, which separate that country from Guinea, found it inhabited by men, who, though under no regular government, and destitute of that knowledge the Arabians were favoured with, lived in content and peace. The first author particularly remarks, "that they never made war, or travelled abroad, but employed themselves in tending their herds, or labouring in the ground." J. Leo says, p. 65. "That they lived in common, having no property in land, no tyrant nor superior lord, but supported themselves in an equal state, upon the natural produce of the country, which afforded plenty of roots, game, and honey. That

Guinea.

Guinea.

That ambition or avarice never drove them into foreign countries to subdue or cheat their neighbours. Thus they lived without toil or superfluities." "The ancient inhabitants of Morocco, who wore coats of mail, and used swords and spears headed with iron, coming amongst these harmless and naked people, soon brought them under subjection, and divided that part of Guinea which lies on the rivers Senegal and Gambia into 15 parts; those were the 15 kingdoms of the negroes, over which the Moors presided, and the common people were negroes. These Moors taught the negroes the Mahometan religion, and arts of life; particularly the use of iron, before unknown to them. About the 14th century, a native negro, called *Heli Ischia*, expelled the Moorish conquerors; but though the negroes threw off the yoke of a foreign nation, they only changed a Libyan for a negro master. *Heli Ischia* himself becoming king, led the negroes on to foreign wars, and established himself in power over a very large extent of country." Since *Leb's* time, the Europeans have had very little knowledge of those parts of Africa, nor do they know what became of his great empire. It is highly probable that it broke into pieces, and that the natives again resumed many of their ancient customs; for in the account published by Moore, in his travels on the river Gambia, we find a mixture of the Moorish and Mahometan customs, joined with the original simplicity of the negroes. It appears by accounts of ancient voyages, collected by Hackluit, Purchas, and others, that it was about 50 years before the discovery of America, that the Portuguese attempted to sail round Cape Bojador, which lies between their country and Guinea: this, after divers repulses occasioned by the violent currents, they effected; when landing on the western coasts of Africa, they soon began to make incursions into the country, and to seize and carry off the native inhabitants. As early as the year 1434, Alonzo Gonzales, the first who is recorded to have met with the natives, being on that coast, pursued and attacked a number of them, when some were wounded, as was also one of the Portuguese; which the author records as the first blood spilt by Christians in those parts. Six years after, the same Gonzales again attacked the natives, and took 12 prisoners, with whom he returned to his vessels: he afterwards put a woman on shore, in order to induce the natives to redeem the prisoners; but the next day 150 of the inhabitants appeared on horses and camels, provoking the Portuguese to land; which they not daring to venture, the natives discharged a volley of stones at them, and went off. After this, the Portuguese still continued to send vessels on the coast of Africa: particularly we read of their falling on a village, whence the inhabitants fled, and, being pursued, 25 were taken; "he that ran best (says the author), taking the most. In their way home they killed some of the natives, and took 55 more prisoners. Afterwards *Dinifanes Dagrama*, with two other vessels, landed on the island *Arguin*, where they took 54 Moors; then running along the coast 80 leagues farther, they at several times took 50 slaves; but here seven of the Portuguese were killed. Then being joined by several other vessels, *Dinifanes* proposed to destroy the island, to revenge the loss of the seven Portuguese; of which the Moors being apprised,

N^o 145.

Guinea.

fled, so that no more than 12 were found, whereof only four could be taken, the rest being killed, as also one of the Portuguese." Many more captures of this kind on the coast of Barbary and Guinea are recorded to have been made in those early times by the Portuguese; who, in the year 1481, erected their first fort at *D'Elmina* on that coast, from whence they soon opened a trade for slaves with the inland parts of Guinea.

From the foregoing accounts, it is undoubted, that the practice of making slaves of the negroes owes its origin to the early incursions of the Portuguese on the coast of Africa, solely from an inordinate desire of gain. This is clearly evidenced from their own historians, particularly *Cada Mosto*, about the year 1455, who writes*, "That before the trade was settled for purchasing slaves from the Moors at *Arguin*, sometimes Collection, vol. i. four, and sometimes more Portuguese vessels, were used p. 576. to come to that gulph, well armed; and landing by night, would surprise some fishermen's villages: that they even entered into the country, and carried off Arabs of both sexes, whom they sold in Portugal." And also, "That the Portuguese and Spaniards, settled on four of the Canary islands, would go to the other island by night, and seize some of the natives of both sexes, whom they sent to be sold in Spain."

After the settlement of America, those devastations, and the captivating the miserable Africans, greatly increased.

Anderson, in his *History of Trade and Commerce*, p. 336, speaking of what passed in the year 1508, writes, "That the Spaniards had by this time found that the miserable Indian natives, whom they had made to work in their mines and fields, were not so robust and proper for those purposes as negroes brought from Africa: wherefore they, about that time, began to import negroes for that end into *Hispaniola*, from the Portuguese settlements on the Guinea coasts; and also afterwards for their sugar-works."

It was about the year 1551, towards the latter end of the reign of *Edward VI.* when some London merchants sent out the first English ship on a trading voyage to the coast of Guinea. This was soon followed by several others to the same parts; but the English not having then any plantations in the West Indies, and consequently no occasion for negroes, such ships traded only for gold, elephants teeth, and Guinea pepper. This trade was carried on at the hazard of losing their ships and cargoes, if they had fallen into the hands of the Portuguese, who claimed an exclusive right of trade, on account of the several settlements they had made there. In 1553, we find captain *Thomas Windham* trading along the coast with 140 men, in three ships, and sailing as far as *Benin*, which lies about 3000 miles down the coast, to take in a load of pepper. Next year *John Lock* traded along the coast of Guinea, as far as *D'Elmina*, when he brought away considerable quantities of gold and ivory. He speaks well of the natives, and says, "That whoever will deal with them must behave civilly, for they will not traffic if ill used." In 1555, *William Towerfon* traded in a peaceable manner with the natives, who made complaint to him of the Portuguese, who were then settled in their castle at *D'Elmina*; saying, "They were bad men; who made them slaves if they could take them, putting irons on their legs."

vol. i.
p. 148.

This bad example of the Portuguese was soon followed by some evil disposed Englishmen: for the same captain Towerfon relates*, "That in the course of his voyage, he perceived the natives near D'Elmina unwilling to come to him, and that he was at last attacked by them; which he understood was done in revenge for the wrong done them the year before by one captain Gainsh, who had taken away the negro captain's son and three others, with their gold, &c. This caused them to join the Portuguese, notwithstanding their hatred of them, against the English." The next year captain Towerfon brought these men back again; whereupon the negroes showed him much kindness. Quickly after this, another instance of the same kind occurred in the case of captain George Fenner, who being on the coast with three vessels, was also attacked by the negroes, who wounded several of his people, and violently carried three of his men to their town. The captain sent a messenger, offering any thing they desired for the ransom of his men: but they refused to deliver them; letting him know, "That three weeks before, an English ship, which came in the road, had carried off three of their people; and that till they were brought again, they would not restore his men, even though they should give their three ships to release them." It was probably the evil conduct of these and some other Englishmen which was the occasion of what is mentioned in Hill's Naval History, viz. "That when captain Hawkins returned from his first voyage to Africa, queen Elizabeth sent for him, when she expressed her concern, lest any of the African negroes should be carried off without their free consent; which she declared would be detestable, and would call down the vengeance of heaven upon the undertakers." Hawkins made great promises, which nevertheless he did not perform; for his next voyage to the coast appears to have been principally calculated to procure negro slaves, in order to sell them to the Spaniards in the West Indies; which occasioned the same author to use these remarkable words: "Here began the horrid practice of forcing the Africans into slavery: an injustice and barbarity, which, so sure as there is vengeance in heaven for the worst of crimes, will some time be the destruction of all who act or who encourage it." This captain Hawkins, afterwards Sir John Hawkins, seems to have been the first Englishman who gave public countenance to this wicked traffic: for Anderson, before mentioned, at p. 401, says, "That in the year 1562, captain Hawkins, assisted by subscription of sundry gentlemen, now fitted out three ships; and having learnt that negroes were a very good commodity in Hispaniola, he sailed to the coast of Guinea, took in negroes, and sailed with them for Hispaniola, where he sold them, and his English commodities, and loaded his three vessels with hides, sugar, ginger, &c. with which he returned home anno 1563, making a prosperous voyage." As it proved a lucrative business, the trade was continued both by Hawkins and others, as appears from the Naval Chronicle, p. 55; where it is said, "That on the 18th of October 1564, captain John Hawkins, with two ships of 700 and 140 tons, sailed for Africa; that on the 8th of December they anchored to the South of Cape Verd, where the captain manned the boat, and sent 80 men in armour into the country, to see if they could

Vol. VIII. Part I.

take some negroes; but the natives flying from them, they returned to their ships, and proceeded farther down the coast. Here they staid certain days, sending their men ashore, in order (as the author says) to burn and spoil their towns and take the inhabitants. The land they observed to be well cultivated, there being plenty of grain and fruit of several sorts, and the towns prettily laid out. On the 25th, being informed by the Portuguese of a town of negroes called *Bymba*, where there was not only a quantity of gold, but 140 inhabitants, they resolved to attack it, having the Portuguese for their guide; but by mismanagement they took but ten negroes, having seven of their own men killed and 27 wounded. They then went farther down the coast; when having procured a number of negroes, they proceeded to the West Indies, where they sold them to the Spaniards." And in the same Naval Chronicle, at p. 76, it is said, "That in the year 1567, Francis Drake, before performing his voyage round the world, went with Sir John Hawkins in his expedition to the coast of Guinea, where taking in a cargo of slaves, they determined to steer for the Caribbee islands." How queen Elizabeth suffered so grievous an infringement of the rights of mankind to be perpetrated by her subjects, and how she was persuaded, about the 30th year of her reign, to grant patents for carrying on a trade from the north part of the river Senegal to 100 leagues beyond Sierra Leona, which gave rise to the African Company†, is hard to account for, any otherwise than that it arose from the misrepresentation made to her of the situation of the negroes, and of the advantages it was pretended they would reap from being made acquainted with the Christian religion. This was the case of Louis XIII. of France: who, Labat, in his account of the isles of America, tells us, "was extremely uneasy at a law by which the negroes of his colonies were to be made slaves; but it being strongly urged to him as the readiest means of their conversion to Christianity, he acquiesced therewith." Nevertheless, some of the Christian powers did not so easily give way in this matter: for we find*, "That cardinal Cibo, one of the pope's principal ministers of state, wrote a letter on behalf of the college of cardinals, or great council at Rome, to the missionaries in Congo, complaining that the pernicious and abominable abuse of selling slaves was yet continued; requiring them to remedy the same if possible; but this the missionaries saw little hopes of accomplishing, by reason that the trade of the country lay wholly in slaves and ivory."

It has been urged in justification of this trade, that by purchasing the captives taken in battle, they save the lives of so many human creatures, who otherwise would be sacrificed to the implacable revenge of the victors. But this pretence has been refuted by an appeal to reason and fact. For if the negroes apprehended they should be cruelly put to death if they were not sent away; why, it is asked, do they manifest such reluctance and dread as they generally do, at being brought from their native country? Smith, in his Account, p. 28. says, "The Gambians abhor slavery, and will attempt any thing, though ever so desperate, to avoid it." And Thomas Philips, in his account of a voyage he performed to the coast of Guinea, writes, "They (the negroes) are so loth to

Guinea.

Guinea. leave their own country, that they have often leaped out of the canoe, boat, or ship, into the sea, and kept under water till they were drowned, to avoid being taken up." But had the fact even been otherwise, the above plea is urged with an extreme bad grace, when it is notorious that the very wars said to be productive of such cruelty were fomented by the infamous arts of the Europeans. From the foregoing accounts, as well as other authentic publications of this kind, it appears, that it was the unwarrantable lust of gain which first stimulated the Portuguese, and afterwards other Europeans, to engage in this horrid traffic. By the most unquestionable relations of those early times, the natives were an inoffensive people, who, when civilly used, traded amicably with the Europeans. It is recorded of those of Benin, the largest kingdom in Guinea, that they were a gentle, loving, people; and Reynold says, "They found more sincere proofs of love and good will from the natives, than they could find from the Spaniards and Portuguese, even though they had relieved them from the greatest misery." And from the same relations there is no reason to think otherwise, but that they generally lived in peace amongst themselves; there occurring no accounts of any wars at that early period, nor of any sale of captives taken in battle.

In fact, it was long after the Portuguese had made a practice of violently forcing the natives of Africa into slavery, that we read of the different negro nations making war upon each other, and selling their captives. And probably this was not the case, till those bordering on the coast, who had been used to supply the vessels with necessaries, had become corrupted by their intercourse with the Europeans, and were excited by drunkenness and avarice to join them in carrying on those wicked schemes, by which those unnatural wars were perpetrated; the inhabitants kept in continual alarms; the country laid waste; and, as Moore expresses it, "infinite numbers sold into slavery." But that the Europeans are the principal cause of these devastations, is particularly evidenced by one whose connection with the trade would rather induce him to represent it in the fairest colours, viz. Captain Smith, the person sent in the year 1726 by the African company to survey their settlements; who, from the information he received of one of the factors who had resided ten years in that country, says, "That the discerning natives account it their greatest unhappiness, that they were ever visited by the Europeans." "That we Christians introduced the traffic of slaves; and that before our coming they lived in peace."

In the accounts relating to the African trade, we find this melancholy truth farther asserted by some of the principal directors in the different factories; particularly A. Brue says †, "That the Europeans were far from desiring to act as peace-makers amongst the negroes; which would be acting contrary to their interest, since the greater the wars, the more slaves were procured." And William Bosman also remarks ‡, "That one of the former commanders gave large sums of money to the negroes of one nation, to induce them to attack some of the neighbouring nations; which occasioned a battle which was more bloody than the wars of the negroes, usually are." This is confirmed by J. Barbot, who says, "That the country of D'El-

mina, which was formerly very powerful and populous, was in his time so much drained of its inhabitants by the intestine wars fomented amongst the negroes by the Dutch, that there did not remain inhabitants enough to till the country."

It has also been advanced as an argument in favour of keeping the negroes in bondage, that there are slaves in Guinea, and that those amongst us might be so in their own country. Not to dwell upon the inconsistency of our giving any countenance to slavery, because the Africans, whom we esteem a barbarous and savage people, allow of it, and perhaps the more from our example; the very circumstance stated, when inquired into, must afford cause of blushing, rather than serve as a palliation of such iniquitous conduct: for it will appear, that the slavery endured in Guinea is by no means so grievous as that in the colonies. Captain Moore, speaking of the natives living on the river Gambia, says, "That some of the negroes have many house slaves, which are their greatest glory; that those slaves live so well and easy, that it is sometimes a hard matter to know the slaves from their masters or mistresses. And that though in some parts of Africa they sell their slaves born in the family, yet on the river Gambia they think it a very wicked thing." The author adds, "He never heard of but one that ever sold a family slave, except for such crimes as they would have been sold for if they had been free." And in Aspley's Collection, speaking of the customs of the negroes in that large extent of country further down the coast, particularly denominated the *Coast of Guinea*, it is said, "They have not many slaves on the coast; none but the king or nobles are permitted to buy or sell any; so that they are allowed only what are necessary for their families, or tilling the ground." The same author adds, "That they generally use their slaves well, and seldom correct them."

From the foregoing accounts of the natural disposition of the negroes, and the fruitfulness of most parts of Guinea, which are confirmed by authors of candour, who have written from their own knowledge, it may well be concluded, that the negroes acquaintance with the Europeans might have been a happiness to them: but these, forgetful of their duty as men and Christians, have conducted themselves in so iniquitous a manner, as must necessarily raise in the minds of the thoughtful and well-disposed negroes the utmost scorn and detestation of the very name of Christians. All other considerations have given way to an insatiable desire of gain, which has been the principal and moving cause of the most detestable and barbarous scene that was perhaps ever acted upon the face of the earth; instead of making use of that superior knowledge with which the Almighty, the common Parent of mankind, had favoured them, to strengthen the principle of peace and good will in the breasts of the incautious negroes, the Europeans have, by their bad example, led them into excess of drunkenness, debauchery, and avarice: whereby every passion of corrupt nature being inflamed, they have been easily prevailed upon to make war and captivate one another, as well to furnish means for the excesses they had been habituated to, as to satisfy the greedy desire of gain in their profligate employers; who to this intent have furnished them with prodigious quantities of arms and ammunition.

p. 98.

§ p. 31.

Guinea. tion. Thus they have been hurried into confusion, distress, and all the extremities of temporal misery; every thing, even the power of their kings, has been made subservient to this wicked purpose; for instead of being protectors of their subjects, some of those rulers, corrupted by the excessive love of spirituous liquors, and the tempting baits laid before them by the factors, have invaded the liberties of their unhappy subjects, and are become their oppressors.

Here it may be necessary to observe, that the accounts we have of the inhabitants of Guinea are chiefly given by persons engaged in the trade, who, from self-interested views, have described them in such colours as were least likely to excite compassion and respect, and endeavoured to reconcile so manifest a violation of the rights of mankind to the minds of the purchasers; yet they cannot but allow the negroes to be possessed of some good qualities, though they contrive as much as possible to cast a shade over them. A particular instance of this appears in Astley's Collection, vol. ii. p. 73; where the author, speaking of the Mandingos settled at Galem, which is situated 900 miles up the Senegal, after saying that they carry on a commerce to all the neighbouring kingdoms, and amass riches, adds, "That excepting the vices peculiar to the blacks, they are a good sort of people, honest, hospitable, just to their word, laborious, industrious, and very ready to learn arts and sciences." Here it is difficult to imagine what vices can be peculiarly attendant on a people so well disposed as the author describes these to be. With respect to the charge some authors have brought against them, as being void of all natural affection, it is frequently contradicted by others. In vol. ii. of the Collection, p. 275 and 629, the negroes of North Guinea and the Gold Coast are said to be fond of their children, whom they love with tenderness. And Bosman says, p. 340, "Not a few in his country (viz. Holland) fondly imagine, that parents here sell their children, men their wives, and one brother the other: but those who think so, deceive themselves; for this never happens on any other account but that of necessity, or some great crime." The same is repeated by J. Barbot, p. 326, and also confirmed by Sir Hans Sloane in the introduction to his natural history of Jamaica; where, speaking of the negroes, he says, "they are usually thought to be haters of their own children; and therefore it is believed that they sell and dispose of them to strangers for money: but this is not true; for the negroes of Guinea being divided into several captainships, as well as the Indians of America, have wars; and besides those slain in battle, many prisoners are taken, who are sold as slaves, and brought thither: but the parents here, although their children are slaves for ever, yet have so great love for them, that no masters dare sell or give away one of their little ones, unless they care not whether their parents hang themselves or no." J. Barbot, speaking of the occasion of the natives of Guinea being represented as a treacherous people, ascribes it to the Hollanders (and doubtless other Europeans) usurping authority, and fomenting divisions between the negroes. At p. 110, he says, "It is well known that many of the European nations trading amongst these people, have very unjustly and inhumanly, without any provocation, stolen away, from time to time,

abundance of the people, not only on this coast, but almost every where in Guinea, who have come on board their ships in a harmless and confiding manner: these they have in great numbers carried away, and sold in the plantations, with other slaves which they had purchased." And although some of the negroes may be justly charged with indolence and supineness, yet many others are frequently mentioned by authors as a careful, industrious, and even laborious people.

By an inquiry into the laws and customs formerly in use, and still in force amongst the negroes, particularly on the Gold Coast, it will be found, that provision was made for the general peace, and for the safety of individuals; even in W. Bosman's time, long after the Europeans had established the slave-trade, the natives were not publicly enslaved, any otherwise than in punishment for crimes, when prisoners of war, or by a violent exertion of the power of their corrupted kings. Where any of the natives were stolen in order to be sold to the Europeans, it was done secretly, or at least only connived at by those in power: this appears from Barbot and Bosman's account of the matter, both agreeing that man-stealing was not allowed on the Gold Coast. The first says, "Kidnapping or stealing of human creatures is punished there, and even sometimes with death." And Bosman, whose long residence on the coast enabled him to speak with certainty, says, "That the laws were severe against murder, thievery, and adultery;" and adds, "That man-stealing was punished on the Gold Coast with rigid severity, and sometimes with death itself." Hence it may be concluded, that the sale of the greatest part of the negroes to the Europeans is supported by violence, in defiance of the laws, through the knavery of their principal men, who (as is too often the case with those in European countries), under pretence of encouraging trade, and increasing the public revenue, disregard the dictates of justice, and trample upon those liberties which they are appointed to preserve.

Moore also mentions man-stealing as being discountenanced by the negro governments on the river Gambia; and speaks of the enslaving the peaceable inhabitants, as a violence which only happens under a corrupt administration of justice. He says, "The kings of that country generally advise with their head men, scarcely doing any thing of consequence without consulting them first, except the king of Barsailay, who being subject to hard drinking, is very absolute. It is to this king's insatiable thirst for brandy, that his subjects freedoms and families are in so precarious a situation. Whenever this king wants goods or brandy, he sends a messenger to the English governor at James Fort, to desire he would send a sloop there with a cargo: *this news being not at all unwelcome*, the governor sends accordingly; against the arrival of the sloop, the king goes and ransacks some of his enemies towns, seizing the people, and selling them for such commodities as he is in want of, which commonly are brandy, guns, powder, balls, pistols, and cutlasses, for his attendants and soldiers; and coral and silver for his wives and concubines. In case he is not at war with any neighbouring king, he then falls upon one of his own towns, which are numerous, and uses them in the same manner. He often goes with some of his troops by a town in the day time, and returning in the night, sets fire

Slaves. to three parts of it, and putting guards at the fourth, there seizes the people as they run out from the fire; he ties their arms behind them, and marches them either to Joar or Cohone, where he sells them to the Europeans."

* *Astley*,
vol. ii.
p. 69.

Mr Brue, the French director, gives much the same account, and says *, "That having received goods, he wrote to the king, that if he had a sufficient number of slaves, he was ready to trade with him. This prince, as well as the other negro monarchs, has always a sure way of supplying his deficiencies, by selling his own subjects, for which they seldom want a pretence. The king had recourse to this method, by seizing 300 of his own people, and sent word to the director that he had the slaves ready to deliver for the goods." It seems the king wanted double the quantity of goods which the factor would give him for these 300 slaves; but the factor refusing to trust him as he was already in the company's debt, and perceiving that this refusal had put the king much out of temper, he proposed that he should give him a licence for taking so many more of his people as the goods he still wanted were worth: but this the king refused, saying, "It might occasion a disturbance amongst his subjects." Except in the above instance, and some others, where the power of the negro kings is unlawfully exerted over their subjects, the slave-trade is carried on in Guinea with some regard to the laws of the country, which allow of none to be sold but prisoners taken in their national wars, or people adjudged to slavery in punishment for crimes; but the largeness of the country, the number of kingdoms or commonwealths, and the great encouragement given by the Europeans, afford frequent pretences and opportunities to the bold designing profligates of one kingdom, to surprize and seize upon not only those of a neighbouring government, but also the weak and helpless of their own; and the unhappy people, taken on those occasions, are, with impunity, sold to the Europeans. These practices are doubtless disapproved of by the most considerate amongst the negroes; for Bosman acquaints us, that even their national wars are not agreeable to such. He says, "If the person who occasioned the beginning of the war be taken, they will not easily admit him to ransom, though his weight in gold should be offered, for fear he should in future form some new design against their repose."

We shall conclude this article with the following account of the shocking methods used in the carrying on of the slave-trade, as described by factors of different nations.

† p. 28.

Mr Moore †, factor for the English African Company on the river Gambia, writes, "That there are a number of negro traders, called *joncoes*, or merchants, who follow the slave-trade as a business; their place of residence is so high up the country as to be six weeks travel from James Fort, which is situated at the mouth of that river. These merchants bring down elephants teeth, and in some years 2000 slaves, most of which, they say, are prisoners taken in war. They buy them from the different princes who take them; many of them are Bombrongs and Petcharies; nations who each of them have different languages, and are brought from a vast way inland. Their way of bringing them is tying them by the neck with leather thongs, at about

a yard distant from each other, 30 or 40 in a string, having generally a bundle of corn or elephants teeth upon each of their heads. In their way from the mountains, they travel through very great woods, where they cannot for some days get water; so they carry in skin bags enough to support them for a time. I cannot (adds Moore) be certain of the number of merchants who follow this trade, but there may, perhaps, be about 100, who go up into the inland country with the goods which they buy from the white men, and with them purchase, in various countries, gold, slaves, and elephants teeth. Besides the slaves which the merchants bring down, there are many bought along the river: These are either taken in war, as the former are, or men condemned for crimes; or else people stolen, which is very frequent.—Since the slave-trade has been used, all punishments are changed into slavery; there being an advantage on such condemnation, they strain for crimes very hard, in order to get the benefit of selling the criminal."

John Barbot, the French factor, in his account of the manner by which the slaves are procured, says, "The slaves sold by the negroes are for the most part prisoners of war, or taken in the incursions they make into their enemies territories; others are stolen away by their neighbours, when found abroad on the road, or in the woods; or else in the corn fields, at the time of the year when their parents keep them there all the day to scare away the devouring small birds." Speaking of the transactions on that part of Guinea called the *Slave Coast*, where the Europeans have the most factories, and from whence they bring away much the greatest number of slaves, the same author says, "The inhabitants of Coto do much mischief in stealing those slaves they sell to the Europeans from the upland country.—That the inhabitants of Popo excel the former; being endowed with a much larger share of courage, they rob more successfully, by which means they increase their riches and trade." The author particularly remarks, "That they are encouraged in this practice by the Europeans: sometimes it happens, according to the success of their inland excursions, that they are able to furnish 200 slaves or more in a few days." And he says, "The blacks of Fida, or Whidah, are so expeditious in trading for slaves, that they can deliver 1000 every month."—"If there happens to be no flock of slaves there, the factor must trust the blacks with his goods, to the value of 150 l. or 200 l. which goods they carry up into the inland country to buy slaves at all markets for above 600 miles up the country, where they are kept like cattle in Europe; the slaves sold there being generally prisoners of war, taken from their enemies like other booty, and perhaps some few sold by their own countrymen, in extreme want, or upon a famine, as also some as a punishment of heinous crimes." So far Barbot's account. That given by Bosman is as follows: "When the slaves which are brought from the inland countries come to Whidah, they are put in prison together; when we treat concerning buying them, they are all brought out together in a large plain, where, by our surgeons, they are thoroughly examined, and that naked, both men and women, without the least distinction or modesty. Those which are approved as good, are set on one side; in the mean while a burning iron, with the arms or name

Guinea.

name of the company, lies in the fire, with which ours are marked on the breast. When we have agreed with the owners of the slaves, they are returned to their prisons; where, from that time forward, they are kept at our charge, and cost us two pence a day each slave, which serves to subsist them like criminals on bread and water; so that to save charges, we send them on board our ships the very first opportunity: before which, their masters strip them of all they have on their backs, so that they come on board stark naked, as well women as men. In which condition they are obliged to continue, if the master of the ship is not so charitable (which he commonly is) as to bestow something on them to cover their nakedness. Six or seven hundred are sometimes put on board a vessel, where they lie as close together as it is possible for them to be crowded."

When the great income which arises to the negro kings on the Slave Coast, from the slaves brought through their several governments to be shipped on board the European vessels, is considered, we have no cause to wonder that they give so great a countenance to that trade. Bosman says, "That each ship which comes to Whidah to trade, reckoning one with another, either by toll, trade, or custom, pays about 400*l.* and sometimes 50 ships come hither in a year." Barbot confirms the same, and adds, "That in the neighbouring kingdom of Ardah, the duty to the king is the value of 70 or 80 slaves for each trading ship;" which is near half as much more as at Whidah. Nor can the Europeans concerned in the trade, with any degree of propriety, blame the African kings for countenancing it, while they continue to send vessels on purpose to take in the slaves which are thus stolen, and that they are permitted, under the sanction of national laws, to sell them to the colonies.

According to a late sensible writer, Mr Ramsay, the annual British exports to these coasts are estimated at 500,000*l.* including a considerable quantity that is annually exchanged with American and other foreign traders there; about 50,000*l.* of this is returned in ivory, gold dust, gum, &c. The greatest part of the profits of the slave trade is raised on the sugar plantations. If by establishing factories, and encouraging civilization on the coast of Africa, and returning some of our West Indian slaves to their original country, we tried to make up for our past treachery to the natives, and instructed the inhabitants in the culture of tobacco, indigo, cotton, rice, &c. to barter with us for our manufactures, and supply us with those articles, our demand for which has been so advantageous to America, great would be our profits. Were Africa civilized, and could we preoccupy the affections of the natives, and introduce gradually our religion, manners, and language among them, we should open a market that would fully employ our manufacturers and seamen, morally speaking, till the end of time. And while we enriched ourselves, we should contribute to their happiness. For Africa, in its highest probable state of culture, could not possibly interfere with the staple of Britain, so as to hinder an extensive and mutually advantageous trade from being carried on between the countries. The great difference of climate and soil must always distinguish the supplies and wants of each.

The slave-trade indeed has been long considered as disgraceful to an enlightened age; and in this country

a spirit is arisen which seems bent on annihilating it altogether, or so changing the nature of it as to blend humanity with policy. During the Session 1788, the philanthropy of parliament, supported by that of the nation, paid a very particular attention to this odious branch of traffic. It was, however, a subject of too comprehensive a nature, and too materially connected with our African commerce at large and our West Indian colonies, to come to an immediate decision upon it. Parliament, therefore, was obliged to content itself for that time with a temporary bill to regulate the shipping and carrying slaves in British vessels from those coasts. But the public attention has been since kept awake by a great variety of publications on both sides of the question; and the final arrangement of this important business, in which the honour of the British commerce and the British character, as well as the happiness of millions of our sable African brethren, is involved, is expected to take place during the present session 1791.—This traffic in human beings is not, however, without its advocates. But the most specious arguments of its ablest defenders reach no further than political expediency, which can never alter the real nature of things. That in question would not remain less an unjust, cruel, and wicked trade, in its very nature essentially and unalterably wrong. Its abolition, therefore, not in a rash, but in as gentle and equitable a way as circumstances will allow, is devoutly to be wished, and it is hoped may be accomplished.

New GUINEA, a long and narrow island of the East Indies, very imperfectly known. It was supposed to be connected with New Holland, until Captain Cook discovered the strait which separates them. *New Guinea*, including *Papua*, its north-western part (which according to Bougainville's conjecture is separated from it by a strait), reaches from the equator to the 12th degree of south latitude, and from 131 to 150 degrees east longitude; in one part it does not appear to be above 50 miles broad. It was first visited by an European ship in 1529. Saavedra, a Portuguese, who made the discovery of the north west part of this country, called it *Terra de Papuas* or *Paper*. Van Schouten, a Dutch discoverer, afterwards gave the name of *New-Guinea* to its south-western part. Admiral Roggewain also touched here; and before him Dampier, 1st January 1700. Captain Cook made the coast of *New-Guinea*, in latitude 6 degrees 15 minutes, longitude 138 east, on the 3d of September, and landed in the pinnace, accompanied by Mr Banks, Doctor Solander, nine of the ship's crew, and servants well armed, and leaving two seamen to take care of the boat, advanced some little way up the country; but coming to the skirts of a thick wood, they judged it prudent to proceed no further, lest they should fall into an ambuscade of the natives, and their retreat to the boat be cut off. Having advanced about a quarter of a mile from the boat, three Indians rushed out of the wood with a hideous shout; they threw their darts, and showed such a hostile disposition, that the party, to prevent the destruction of these people, returned to the boat, as they had no intention forcibly to invade their country, either to gratify their appetites or curiosity, and it was evident nothing could be done upon friendly terms. When they got on board the boat, they rowed along the shore, and the number of Indians as-

Guise.

sembled seemed to be between 60 and 100. They made much the same appearance as the New-Hollanders, being stark naked, and their hair cropped short. All the while they were shouting defiance, and throwing something out of their hand which burnt exactly like gun-powder, but made no report; what these fires were, or for what purpose intended, could not be guessed at; those who discharged them had in their hands a short piece of stick, possibly a hollow cane, which they swung sidewise from them, and immediately fire and smoke issued, exactly resembling the discharge of a musket, and of no longer duration. This wonderful phenomenon was observed from the ship; and the deception was so great, that the people on board thought they had fire-arms; and even in the boat if they had not been so near as that they must have heard the report, if there had been any, they should have thought they had been firing volleys. After looking at them attentively for some time, without taking any notice of their flashing and vociferation, the sailors fired some muskets over their heads. Upon hearing the balls rattle among the trees, they walked leisurely away, and the boat returned to the ship. Upon examining some weapons which the natives had thrown, they were found to be light darts, about four feet long, very ill made, of a reed or bamboo cane, and pointed with hard wood, in which there were many barbs. They were discharged with great force, for at 60 yards distance they went beyond the party; but in what manner they were thrown could not be exactly seen. But the general opinion was, that they were thrown with a stick in the manner practised by the New-Hollanders.

The land here is very low, as is every other part of the coast; but it is covered with a luxuriance of wood and herbage that can scarcely be conceived. Here the cocoa-nut, plantain, and bread-fruit, flourish in the highest perfection.

GUINEA, a gold coin, struck and current in Britain. The value or rate of guineas has varied: it was first struck on the footing of 20 s. by the scarcity of gold was afterwards advanced to 21 s. 6 d. but it is now sunk to 21 s.

The pound weight troy of gold is cut into 44 parts and a half; each part makes a guinea.—This coin took its denomination *guinea*, because the gold, whereof the first was struck, was brought from that part of Africa called *Guinea*; for which reason it likewise bore the impression of an elephant.

GUINEA Company. See COMPANY (African.)

GUINEA-Hen, in ornithology. See NUMIDA.

GUINEA-Pig, in zoology. See MUS.

GUINEA-Wheat. See ZEA.

GUIPUSCOA, the north-east division of the province of Biscay in Spain, situated on the confines of Navarre.

GUISE, a small town of France in Picardy, and in Tierache, with a very strong castle, and the title of a duchy. It is seated on the river Ouse, in E. Long. 3. 42. N. Lat. 49. 54.

GUISE (Henry) of Lorraine, duke of Guise (eldest son of Francois of Lorraine duke of Guise), memorable in the history of France as a gallant officer; but an imperious, turbulent, seditious subject, who placed himself at the head of an armed force, and called his rebel

band, *The League*. The plan was formed by the cardinal, his younger brother; and under the pretext of defending the Roman Catholic religion, the king Henry III. and the freedom of the state, against the design of the Huguenots, or French Protestants, they carried on a civil war, massacred the Huguenots, and governed the king, who forbid his appearance at Paris: but Guise now became an open rebel, entered the city against the king's express order, and put to the sword all who opposed him; the streets being barricaded to prevent his progress, this fatal day is called in the French history, *The day of the barricades*. Masters of Paris, the policy of the Guises failed them: for they suffered the king to escape to Blois, though he was deserted in his palace at Paris by his very guards. At Blois, Henry convened an assembly of the states of France; the duke of Guise had the boldness to appear to a summons sent him for that purpose; a forced reconciliation took place between him and the king, by the advice of this assembly; but it being accidentally discovered, that Guise had formed a design to dethrone the king, that weak monarch, instead of resolutely bringing him to justice, had him privately assassinated, December 23. 1558, in the 38th year of his age. His brother the cardinal shared the same fate the next day.

GUITTAR, GUITARRA, a musical instrument of the stringed kind, with five double rows of strings; of which those that are brads are in the middle, except it be for the burden, an octave lower than the fourth. —This instrument was first used in Spain and by the Italians. In the former country it is still greatly in vogue. There are few of that nation who cannot play on the guitar; and with this instrument they serenade their mistresses at night. At Madrid, and other cities in that country, it is common to meet in the streets young men equipped with a guitar and a dark lanthorn, who, taking their station under the windows, sing, and accompany their voices with this instrument; and there is scarce an artificer or day-labourer in any of the cities or principal towns who does not entertain himself with his guitar.

GULDENSTAEDT (John Anthony), was born at Riga, April 26. 1745; received the rudiments of his education in that town; and in 1763 was admitted into the medical college of Berlin. He completed his studies at Frankfort upon the Oder, and in 1767 received the degree of M. D. in that university. On account of his knowledge of foreign languages, and the considerable progress he had made in natural history, he was considered as a fit person to engage in the expeditions which were planned by the imperial academy. Being invited to St Petersburg, he arrived in that city in 1768, was created adjunct of the academy, and afterwards, in 1770, member of that society, and professor of natural history. In June 1761 he set out upon his travels, and was absent seven years. From Moscow, where he continued till March 1769, he passed to Voronetz, Tzaritzin, Astracan, and Kislar, a fortress upon the western shore of the Caspian, and close to the confines of Persia. In 1770 he examined the districts watered by the rivers Terek, Sunsha, and Alk-fai, in the eastern extremity of Caucasus; and in the course of the ensuing year penetrated into Ossitia, in the highest part of the same mountain; where he collected

lected vocabularies of the languages spoken in those regions, made inquiries into the history of the people, and discovered some traces of Christianity among them. Having visited Cabarda and the northern chain of the Caucasus, he proceeded to Georgia, and was admitted to an audience of prince Heraclius, who was encamped about ten miles from Teflis. Having passed the winter here, and in examining the adjacent country, he followed in spring the prince to the province of Koketia, and explored the southern districts inhabited by the Turcoman Tartars in the company of a Georgian magnate, whom he had cured of a dangerous disorder. In July he passed into Imeretia, a country which lies between the Caspian and Black Seas, and is bounded on the east by Georgia, on the north by Osetia, on the west by Mingrelia, and on the south by the Turkish dominions. He penetrated into the middle chain of mount Caucasus, visited the confines of Mingrelia, Middle Georgia, and Eastern and Lower Imeretia; and, after escaping many imminent dangers from the banditti of those parts, fortunately returned to Kiflar on the 18th of November, where he passed the winter, collecting various information concerning the neighbouring Tartar tribes of the Caucasus, and particularly the Lesgees. In the following summer he journeyed to Cabarda Major, continued his course to mount Beshton, the highest point of the first ridge of the Caucasus; inspected the mines of Madshar, and went to Tcherkash upon the Don. From thence he made expeditions to Azof and Taganrog, and then, along the new limits to the Dnieper, he finished this year's route at Kremenshuk, in the government of New Russia. In the ensuing spring, he was proceeding to Crim Tartary; but receiving an order of recal, he returned through the Ukraine to Moscow and St Petersburg, where he arrived in the month of March 1775. Upon his return, he was employed in arranging his papers; but before he could finish them for the press, was seized with a violent fever, which carried him to the grave in March 1781. His writings which have been hitherto published consist of a number of curious treatises, of which a list is given in Coxe's Travels, Vol. I. p. 162.

GULA, in anatomy, the œsophagus or gullet; that conduit by which animals take down food into the stomach. See ANATOMY, n° 92.

GULE of AUGUST, the day of St Peter *ad vincula*, which is celebrated on the first of August. It is called the *gule of August*, from the Latin *gula*, "a throat," for this reason, that one Quirinus, a tribune, having a daughter that had a disease in her throat, went to Pope Alexander, the sixth from St Peter, and desired of him to see the chains that St Peter was chained with under Nero; which request being granted, and she, kissing the chains, was cured of her disease; whereupon the Pope instituted this feast in honour of St Peter; and, as before, this day was termed only the calends of August, it was on this occasion called indifferently either the day of St Peter *ad vincula*, from what wrought the miracle; or the *gule of August*, from that part of the virgin whereon it was wrought.

GULES, in heraldry, a corruption of the French word *gueules*, which in this science signifies "red," and

is represented in engraving by perpendicular lines. It may serve of itself to denote martial prowess, boldness, and hardiness: for the ancients used this colour to make themselves terrible to their enemies, to stir up magnanimity, and to prevent the seeing of blood, by the likeness of the colours; for which reason perhaps it is used by the English. But, according to G. Leigh, if this tincture is compounded with

Or.	} it signifies	Desire.
Arg.		Envy.
Azu.		Ardour.
Ver.		Strength.
Pur.		Justice.
Sab.		Weariness.

This colour is by the generality of the English heralds ranked before azure; but French heralds, N. Upton and his followers, prefer azure to it.

GULL, in ichthyology. See LARUS.

GULF, a broad and capacious bay comprehended between two promontories, and sometimes taking the name of a *sea* when it is very extensive; but particularly when it only communicates with the sea by means of a strait. Such are the Euxine or Black Sea, otherwise called the *Gulf of Constantinople*; the Adriatic Sea, called also the *Gulf of Venice*; the gulph of Sidra near Barbary; and the gulph of Lions near France. All these gulfs are in the Mediterranean. There are, besides the gulf of Mexico, the gulf of St Lawrence, and the gulph of California, which are in North America. There are also the gulf of Persia, otherwise called the *Red Sea*, between Persia and Arabia; the gulf of Bengal in India; and the gulfs of CochinChina and Kamtschatka, near the countries of the same name.

The word comes from the French *golfe*, and that from the Italian *golfo*, which signify the same. Some deduce these further from the Greek γολφός; which Guishart again derives from the Hebrew גולב *gob*. Du Cange derives them from the barbarous Latin *gulfum*, or *gulfus*, which signify the same thing.

GULLET. See GULA.

GUM (*Gummi*), is a concrete vegetable juice, of no particular smell or taste, becoming viscous and tenacious when moistened with water; totally dissolving in water into a liquid, more or less glutinous in proportion to the quantity of the gum; not dissolving in vinous spirits or in oils; burning in the fire to a black coal, without melting or catching flame; suffering no dissipation in the heat of boiling water.

The true gums are gum arabic, gum tragacanth, gum senega, the gum of cherry and plum trees, and such like. All else have more or less of resin in them.

Gum Arabic is the produce of a species of *MIMOSA*; which see.

The medical character of gum arabic is its glutinous quality, in consequence of which it serves to incrassate and obtund thin acrid humours, so proves useful in tickling coughs, alvine fluxes, hoarsenesses, in fluxes of the belly with gripes, and where the mucus is abraded from the bowels or from the urethra. In a dysuria the true gum arabic is more cooling than the other simple gums, so should be preferred.

One ounce of gum arabic renders a pint of water considerably glutinous: four ounces gives it a thick syrupy

Gulf
||
Gum.

Gum.

consistence: but for mucilage, one part gum to two parts water is required; and for some purposes an equal proportion will be necessary.

Vol. i.
319 &c.

In Dr Percival's Essays we have the following curious account, by Mr Henry, of the faculty which this gum hath of dissolving and keeping suspended in water not only resinous but also other substances, which should seem not likely to be at all affected by it.

"One scruple of balsam of tolu, rubbed with half an ounce of distilled rain-water, added gradually to it for 15 minutes, formed a mixture, which on standing about a minute subsided, but re-united by shaking: being set by a few days, the balsam became a concrete mass, not again miscible by shaking up the bottle. The same quantity required more trituration to mix it with common pump-water. One scruple of the same, rubbed with 15 grains of gum arabic, was nearly as long in perfectly uniting with half an ounce of distilled water as that without the gum. This was perhaps owing to the latter piece being more resinous; however, though on long standing there was a small sediment, it immediately reunited a week after by agitation. Fifteen grains of balsam capivi united very smoothly with half an ounce of distilled water, by the medium of three grains of gum arabic. Five grains of the gum were not so effectual with pump-water. Balsam Peru ten drops, with gum arabic three grains, distilled water half an ounce, formed a neat white emulsion, but with common water a very unequal mixture. Gum myrrh (powdered that there might be no difference in the several quantities used), half a scruple, dissolved readily with gum arabic three grains, in both kinds of water, and even mixed with them by longer trituration without any medium, but more easily with distilled than common spring water. Olibanum, mastich, gum guaiacum, and galbanum, may likewise be mixed with water by rubbing, without any gum arabic or egg. The spring-water made use of in these experiments was very aluminous.

"In the making of all the saline preparations, when any considerable quantities of water are used, distilled or pure rain or river water is greatly to be preferred; for the calcareous, aluminous, and selenitical matter, which so much abounds in most spring water, will render any salt dissolved in it very impure.

"The solution of crude mercury with mucilage of gum arabic being so easily accomplished, and it being very disagreeable to many patients, and to some almost impossible, to swallow pills, boluses, or electuaries, I was induced to try whether calomel, cinnabar, and the other heavy and metalline bodies commonly administered only under these forms, might not by the same means be rendered miscible with water, so as to be given more agreeably in a liquid form. I accordingly rubbed ten grains of cinnabar of antimony and a scruple of gum arabic, with a sufficient quantity of distilled water to form a mucilage, and added a drachm of simple syrup and three drachms more of water. This makes an agreeable little draught; and having stood about half an hour without depositing any sediment, I added three drachms more of water to it; and notwithstanding the mucilage was rendered so much more dilute, very little of the cinnabar subsided even after it had stood some days.

"Steel simply prepared, and prepared tin, were both
N^o 145.

Gum.

mixed with water by their own weight of gum arabic, and remained suspended, except a very small portion of each, which was not reduced to a sufficiently fine powder.

"Five grains of calomel were mixed with two drachms of distilled water and half a drachm of simple syrup by means of five grains of gum arabic, which kept it sufficiently suspended: a double quantity of the gum preserved the mixture uniform still longer. In this form it will be much more easily given to children than in syrups, conserves, &c. as a great part of it is generally wasted, in forcing those viscid vehicles into them; and it may be joined with scammony and other resinous purgatives by the same method, and of these perhaps the gum arabic would be the best corrector.

"Gum arabic likewise greatly abates the disagreeable taste of the corrosive sublimate, mixed with water instead of brandy; and (from the few trials I have made) sits easier on the stomach, and will not be so apt to betray the patient by the smell of the brandy.

"Mr Plenck, who first instructed us in the method of mixing quicksilver with mucilage, observes (and experience confirms the truth of it), that this preparation is not so apt to bring on a spitting as the *argent. viv.* mixed by any other medium, or as the saline and other mercurial preparations.—How far the theory by which he accounts for it may be just is not of much importance; but it may perhaps be worth while to inquire, whether it would not be equally effectual in preventing calomel, and the other preparations of mercury, from affecting the mouth.—If so, is it not improper, where a salivation is intended, to give emulsions with gum arabic and other mucilaginous liquors for the patient's common drink, as by that means the spitting may be retarded? And, on the contrary, may it not be a useful medicine to diminish the discharge when too copious?

"The following case may in some measure serve to confirm the above observation.—A gentleman, always easily affected by mercurials, having taken about 26 grains of calomel in doses from one to three grains, notwithstanding he was purged every third day, was suddenly seized with a salivation. He spat plentifully, his breath was very fetid, teeth loose, and his gums, fauces, and the margin of his tongue, greatly ulcerated and inflamed. He was directed to use the following gargle. *R. Gum. arab. semiunc. solve in aquæ font. bullient. selib. & adde mel. rosac. unc. unam. M. ft. gargar.* And to drink freely of a ptisan prepared with *aq. bord. lib. ij. gum. arabic. unc. ij. nitr. pur. drachm. ij. sacchar. alb. unc. j.* His purgative was repeated the succeeding morning. The next day his gums were less inflamed, but the sloughs on his tongue, &c. were still as foul: his spitting was much the same: he had drank about a pint of the ptisan. Some *spt. vitrioli* was added to the gargle. From this day to the fourth he was purged every day without effect, his salivation still continued, his mouth was no better, he had neglected the mucilaginous drink. This evening he was persuaded to drink about a pint of it which remained, and he had it repeated, and drank very freely of it that night. On the fifth morning the purgative was again repeated. Though it operated very little, yet the change was very surprising: his mouth was nearly well, and his ptyalism greatly decreased. The ptisan was repeated; and

Gum. and on the sixth day, being quite well, he was permitted to go abroad."

In Mr Hæffelquist's Travels we have an instance of the extraordinary nutritive virtues of this gum. "The Abyssinians (says he) make a journey every year to Cairo, to sell the products of their country. They must travel over terrible deserts, and their journey depends as much on the weather as a voyage at sea: consequently they know as little as a seaman how long they must be on their journey; and the necessaries of life may chance to fail them when the journey lasts too long. This happened to the Abyssinian caravan in the year 1740, their provisions being consumed when they had still two months to travel. They were then obliged to search for something among their merchandise wherewith they might support nature; and found nothing more proper than gum arabic, of which they had carried a considerable quantity along with them. This served to support above 1000 persons for two months; and the caravan at last arrived at Cairo without any great loss of people either by hunger or diseases."

Gum Seneca, is a gum extremely resembling gum arabic. It is brought to us from the country through which the river Senega runs, in loose or single drops: but these are much larger than those of the gum arabic usually are; sometimes it is of the bigness of an egg, and sometimes much larger: the surface is very rough or wrinkled, and appears much less bright than the inner substance where the masses are broken. It has no smell, and scarce any taste. It is probably produced from a tree of the same kind with the former. The virtues of it are the same with the gum arabic; but it is rarely used in medicine, unless as mixed with the gum arabic: the dyers and other artificers consume the great quantities of it that are annually imported hither. The negroes dissolve it in milk, and in that state make it a principal ingredient in many of their dishes, and often feed on it thus alone.

Gum Tragacanth, the gum of the tragacanth, a thorny bush growing in Crete, Asia, and Greece. See *ASTRAGALUS*.

Other substances known by the name of *gums* are as follow:

Gum Ammoniac. See *AMMONIAC*.

Gum Elemi. See *AMYRIS*.

Gum Keno. See *KENO*.

Gum Guaiacum. See *GUAIAECUM*.

Gum Lacca. See *COCCUS* and *LACCA*.

GUM, among gardeners, a kind of gangrene incident to fruit-trees of the stone kind, arising from a corruption of the sap, which, by its viscosity, not being able to make its way through the fibres of the tree, is, by the protrusion of other juice, made to extravasate and ooze out upon the bark.

When the distemper surrounds the branch, it admits of no remedy; but when only on one part of a bough, it should be taken off to the quick, and some cowdung clapped on the wound, covered over with a linen cloth, and tied down. M. Quintinie directs to cut off the morbid branch two or three inches below the part affected.

GUMMA, a sort of venereal excrescence on the periosteum of the bones.

GUMS, in anatomy, the hard fleshy substance in

either jaw, through which the teeth spring from the jawbone. See *ANATOMY*, n° 102.

The gums are apt to become spongy, and to separate from the teeth; but the cause is frequently a stony kind of crust, which forms itself therein, which when separated, the gums soon return to their former state, especially if rubbed with a mixture of the infusion of roses four parts, and the tincture of myrrh one part.—The scurvy is another disorder which affects the gums. This disorder, when not manifest in any other part, sometimes appears in this: indeed, when a scorbutic disorder invades the whole habit, its first symptom is a putrid state of the gums.

GUN, in the military art, a fire-arm, or weapon of offence, which forcibly discharges a ball or other hard and solid matter through a cylindric tube, by means of inflamed gun-powder. See *GUN-POWDER*.

The word gun now includes most of the species of fire-arms; pistols and mortars being almost the only ones excepted from this denomination. They are divided into great and small guns: the former including all that we also call cannon, ordnance, or artillery; the latter includes musquets, carabines, musquetoons, blunderbusses, fowling-pieces, &c.

It is not known at what time these weapons were first invented. Though, comparatively speaking, the introduction of guns into the western part of the world is but of a modern date; yet it is certain that in some parts of Asia they have been used, though in a very rude and imperfect manner, for many ages.—Philostratus speaks of a city near the river Hyphasis in the Indies, which was said to be impregnable, and that its inhabitants were relations of the gods, because they threw thunder and lightning upon their enemies. Hence some imagine that guns were used by the eastern nations even in the time of Alexander the Great; but however this may be, many of our modern travellers assert that they were used in China as far back as the year of Christ 85, and have continued in use ever since.

The first hint of the invention of guns in Europe is in the works of Roger Bacon, who flourished in the 13th century. In a treatise written by him about the year 1280, he proposes to apply the violent explosive force of gun-powder for the destruction of armies. In 1320, Bartholomew Schwartz, a German monk, is commonly said to have invented gun-powder, though it is certainly known that this composition is described by Bacon in some of his treatises long before the time of Schwartz. The following is said to have been the manner in which Schwartz invented gun-powder. Having pounded the materials for it in a mortar, which he afterwards covered with a stone, a spark of fire accidentally fell into the mortar and set the mixture on fire; upon which the explosion blew the stone to a considerable distance. Hence it is probable that Schwartz might be taught the simplest method of applying it in war; for Bacon seems rather to have conceived the manner of using it to be by the violent effort of the flame unconfined, and which is indeed capable of producing astonishing effects*. The figure and name of *mortars* * See *Gun-powder*. given to a species of old artillery, and their employment (which was throwing great stone-bullets at an elevation), very much corroborates this conjecture.

Soon after the time of Schwartz, we find guns commonly made use of as instruments of war. Great

Gun. guns were first used. They were originally made of iron-bars soldered together, and fortified with strong iron-hoops; some of which are still to be seen, viz. one in the Tower of London, two at Woolwich, and one in the royal arsenal at Lisbon. Others were made of thin sheets of iron rolled up together and hooped; and on emergencies they were made of leather, with plates of iron or copper. These pieces were made in a rude and imperfect manner, like the first essays of many new inventions. Stone-balls were thrown out of them, and a small quantity of powder used on account of their weakness. These pieces had no ornaments, were placed on their carriages by rings, and were of a cylindrical form. When or by whom they were made is uncertain: the Venetians, however, used cannon at the siege of Claudia Jessa, now called *Chioggia*, in 1366, which were brought thither by two Germans, with some powder and leaden balls; as likewise in their wars with the Genoese in 1379. King Edward III. made use of cannon at the battle of Cressy in 1346, and at the siege of Calais in 1347. Cannon were made use of by the Turks at the siege of Constantinople, then in possession of the Christians, in 1394, and in that of 1452, that threw a weight of 100lb. but they generally burst either the first, second, or third shot. Louis XII. had one cast at Tours, of the same size, which threw a ball from the Bastile to Charenton. One of those famous cannon was taken at the siege of Dieu in 1546, by Don John de Castro; and is in the castle of St Juliao da Barra, 10 miles from Lisbon: its length is 20 feet 7 inches, diameter at the centre 6 feet 3 inches, and it discharges a ball of 100lb. It has neither dolphins, rings, nor button; is of a curious kind of metal; and has a large Indostan inscription upon it, which says it was cast in 1400.

Formerly the cannon were dignified with uncommon names; for, in 1503, Louis XII. had 12 brass cannon cast, of an extraordinary size, called after the names of the 12 peers of France. The Spanish and Portuguese called them after their saints. The emperor Charles V. when he marched before Tunis, founded the 12 apostles. At Milan there is a 70 pounder, called the *Pimontelle*; and one at Bois-le-duc, called the *Devil*. A 60 pounder at Dover-castle, called *Queen Elizabeth's pocket-pistol*. An 80 pounder in the Tower of London (formerly in Edinburgh-castle), called *Mounts-meg*. An 80 pounder in the royal arsenal at Berlin, called the *Thunderer*. An 80 pounder at Malaga, called the *Terrible*. Two curious 60 pounders in the arsenal at Bremen, called the *Messengers of bad news*. And, lastly, an uncommon 70 pounder in the castle of St Angelo at Rome, made of the nails that fastened the copper-plates which covered the ancient Pantheon, with this inscription upon it: *Ex clavis trabalibus porticus Agrippæ*.

In the beginning of the 15th century these uncommon names were generally abolished, and the following more universal ones took place, viz.

	Pounders.	Cwt.
Cannon royal, or carthoun	= 48	about 90
Bastard cannon, or $\frac{1}{2}$ carthoun	= 36	79
$\frac{1}{3}$ Carthoun	= 24	60
Whole culverins	= 18	50

	Pounders.	Cwt.
Demi culverins	= 9	30
Falcon	= 6	25
Sacker { lowest sort	= 5	13
{ ordinary	= 6	15
{ largest size	= 8	18
Basilisk	= 48	85
Serpentine	= 4	8
Aspic	= 2	7
Dragon	= 6	12
Syren	= 60	81
Falconet	= 3, 2, & 1	15, 10, 5.

Moyens, which carried a ball of 10 or 12 ounces, &c.
Rabinet, which carried a ball of 16 ounces.

These curious names of beasts and birds of prey were adopted on account of their swiftness in motion or of their cruelty; as the falconet, falcon, sacker, and culverin, &c. for their swiftness in flying; the basilisk, serpentine, aspike, dragon, syren, &c. for their cruelty.

At present cannon take their names from the weight of the ball they discharge. Thus a piece that discharges a ball of 24 pounds, is called a 24 pounder; one that carries a ball of 12 pounds, is called a 12 pounder; and so of the rest, divided into the following sorts, viz.

Ship-guns, consisting in 42, 36, 32, 24, 18, 12, 9, 6, and 3 pounders.

Garrison-guns, in 42, 32, 24, 18, 12, 9, and 6 pounders.

Battering-guns, in 24, 18, and 12 pounders.

Field-pieces, in 12, 9, 6, 3, 2, $1\frac{1}{2}$, 1, and $\frac{1}{2}$ pounders.

Mortars are thought to have been fully as ancient as cannon. They were employed in the wars of Italy, to throw balls of red-hot iron, stones, &c. long before the invention of shells. These last are thought to be of German invention, and the use of them in war to have been taught by the following accident. A citizen of Venlo, at a certain festival celebrated in honour of the duke of Cleves, threw a number of shells, one of which fell on a house and set fire to it, by which misfortune the greatest part of the town was reduced to ashes. The first account of shells used for military purposes is in 1435, when Naples was besieged by Charles VIII. History informs us with more certainty, that shells were thrown out of mortars at the siege of Wachtendonk, in Guelderland, in 1588, by the Earl of Mansfield. Mr Malter, an English engineer, first taught the French the art of throwing shells, which they practised at the siege of Motte in 1634. The method of throwing red-hot balls out of mortars was first certainly put in practice at the siege of Stralsund in 1675 by the elector of Brandenburg; though some say in 1653 at the siege of Bremen. For the proper dimensions of guns, their weight, the metal of which they are formed, &c. see the article GUNNERY.

Muskets were first used at the siege of Rhege in the year 1521. The Spaniards were the first who armed part of their foot with these weapons. At first they were very heavy, and could not be used without a rest. They had match-locks, and did execution at a great distance. On their march the soldiers carried only the rests and ammunition, and had boys to bear their muskets after them. They were very slow in loading, not only by reason of the unwieldiness of their pieces, and

Gundelia.
Gunnellus.

and because they carried the powder and ball separate, but from the time it took to prepare and adjust the match; so that their fire was not near so brisk as ours is now. Afterwards a lighter matchlock-musket came in use: and they carried their ammunition in bandeliers, to which were hung several little cases of wood covered with leather, each containing a charge of powder. The balls were carried loose in a pouch, and a priming-horn hanging by their side. The muskets with rests were used as late as the beginning of the civil wars in the time of Charles I. The lighter kind succeeded them, and continued till the beginning of the present century, when they also were disused, and the troops throughout Europe armed with firelocks.

GUNDELIA, in botany: A genus of the polygamia segregatae order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositae*. There is scarce any calyx, but quinqueflorous, with tubular hermaphrodite florets; the receptacle bristly, with scarce any pappus.

GUNELLUS, in ichthyology. See **BLENNIUS**.

GUNNER, an officer appointed for the service of the cannon, or one skilled to fire the guns.

Gunner,
Gunnera.

In the Tower of London, and other garrisons, as well as in the field, this officer carries a field staff, and a large powder-horn in a string over his left shoulder: he marches by the guns; and when there is any apprehension of danger, his field-staff is armed with match. His business is to lay the gun to pass, and to help to load and traverse her.

Master GUNNER, a patent-officer of the ordnance, who is appointed to teach all such as learn the art of gunnery, and to certify to the master-general the ability of any person recommended to be one of the king's gunners. To every scholar he administers an oath not to serve, without leave, any other prince or state; or teach any one the art of gunnery but such as have taken the said oath.

GUNNERA, in botany; a genus of the diandria order, belonging to the gynandria class of plants. The amentum consists of uniflorous scales; there is neither calyx nor corolla; the germen is bidentate, with two styles and one seed.

G U N N E R Y,

IS the art of charging, directing, and exploding fire-arms, as cannons, mortars, muskets, &c. to the best advantage.—As this art depends greatly on having the guns and shot of a proper size and figure, and well adapted to each other, it hence follows that the proper dimensions, &c. of cannon and small arms come properly to be considered under the present article.

SECT. I. *History of Gunnery.*

History.

THE ancients, who knew not the use of gunpowder and fire-arms, had notwithstanding machines which were capable of discharging stones, darts, and arrows, with great force. These were actuated chiefly by the elastic force of ropes, or of strong springs, and required a great number of men to work them; for which reason, the explosion of gunpowder, as acting instantaneously, and seemingly with irresistible force, seemed to be a most proper succedaneum for all the powers by which the military engines in former times were actuated. It soon appeared, however, that this force was not very easily applied. Though the experiment of Bartholomew Schwartz, mentioned under the article **GUN**, had given a good hint towards this application in a successful manner, yet the violent reaction of the inflamed powder on the containing vessels rendered them very apt to burst, to the great danger of those who stood near them. The gunpowder in those days, therefore, was much weaker than it is now made; though this proved a very insufficient remedy for the inconvenience above mentioned. It was also soon discovered, that iron-bullets of much less weight than stone ones would be more efficacious if impelled by greater quantities of stronger powder. This occasioned an alteration in the matter and form of the cannon, which were now cast of brass. These were lighter and more manageable than the former, at the same time that they were stronger in proportion to their bore. Thus they were capable of enduring greater charges of a better powder than what had been formerly used;

and their iron-bullets (which were from 40 to 60 pounds weight), being impelled with greater velocities, were more effectual than the heaviest stones could ever prove. This change took place about the latter end of the 15th century.

By this means powder compounded in the manner now practised over all Europe came first in use. But the change of the proportion of materials was not the only improvement it received. The method of graining it is undoubtedly a considerable advantage. At first the powder was always in the form of fine meal, such as it was reduced to by grinding the materials together. It is doubtful whether the first graining of powder was intended to increase its strength, or only to render it more convenient for filling into small charges and the charging of small arms, to which alone it was applied for many years, whilst meal-powder was still made use of for cannon. But at last the additional strength which the grained powder was found to acquire from the free passage of the air between the grains, occasioned the meal-powder to be entirely laid aside.

For the last two hundred years, the formation of cannon hath been very little improved; the best pieces of modern artillery differing little in their proportions from those used in the time of Charles V. Indeed lighter and shorter pieces have been often proposed and essayed; but though they have their advantages in particular cases, yet it seems now to be agreed that they are altogether insufficient for general service. But though the proportions of the pieces have not been much varied within that period, yet their use and application have undergone considerable alterations; the same ends being now accomplished by smaller pieces than what were formerly thought necessary. Thus the battering cannon now universally approved of are those formerly called *demi-cannons*, carrying a ball of 24 pounds weight; it being found by experience, that their stroke, though less violent than that

Theory.

of larger pieces, is yet sufficiently adapted to the strength of the usual profiles of fortification; and that the facility of their carriage and management, and the ammunition they spare, give them great advantages beyond the whole cannons formerly employed in making breaches. The method also of making a breach, by first cutting off the whole wall as low as possible before its upper part is attempted to be beat down, seems also to be a considerable modern improvement in the practical part of gunnery. But the most considerable improvement in the practice is the method of firing with small quantities of powder, and elevating the piece so that the bullet may just go clear of the parapet of the enemy, and drop into their works. By this means the bullet, coming to the ground at a small angle, and with a small velocity, does not bury itself, but bounds or rolls along in the direction in which it was fired: and therefore, if the piece be placed in a line with the battery it is intended to silence, or the front it is to sweep, each shot rakes the whole length of that battery or front; and has thereby a much greater chance of disabling the defendants, and dismounting their cannon, than it would have if fired in the common manner. This method was invented by Vauban, and was by him styled *Batterie à Ricochet*. It was first put in practice in the year 1692 at the siege of Aeth.—Something similar to this was put in practice by the king of Prussia at the battle of Rosbach in 1757. He had several six-inch mortars, made with trunnions and mounted on travelling carriages, which fired obliquely on the enemy's lines, and amongst their horse. They were charged with eight ounces of powder, and elevated at an angle of one degree fifteen minutes, and did great execution; for the shells rolling along the lines with burning-fuses made the stoutest of the enemy not wait for their bursting.

SECT. II. *Theory of Gunnery.*

²
Theory of
gunnery
first at-
tempted by
Tartalea.

THE use of fire-arms had been known for a long time before any theory concerning them was attempted. The first author who wrote professedly on the flight of cannon-shot was Tartalea. In 1537 he published a book, at Venice, intitled *Nova Scientia*; and afterwards another, intitled *Quasiti et Inventioni diversi*, printed at the same place in 1546, in which he treats professedly on these motions. His discoveries were but few, on account of the imperfect state of mechanical knowledge at that time. However, he determined, that the greatest range of cannon was with an elevation of 45 degrees. He likewise determined, (contrary to the opinion of practitioners), that no part of the tract described by a bullet was a right line; although the curvature was in some cases so little, that it was not attended to. He compared it to the surface of the sea; which, though it appears to be a plane, is yet undoubtedly incurvated round the centre of the earth. He also assumes to himself the invention of the gunner's quadrant, and often gave shrewd guesses at the event of some untried methods. But as he had not opportunities of being conversant in the practice, and founded his opinions only on speculation, he was condemned by most of the succeeding writers, though often without any sufficient reason. The philosophers of those times also intermeddled in the que-

stions hence arising; and many disputes on motion were set on foot (especially in Italy), which continued till the time of Galileo, and probably gave rise to his celebrated *Dialogues on motion*. These were published in the year 1638; but in this interval, and before Galileo's doctrine was thoroughly established, many theories of the motion of military projectiles, and many tables of their comparative ranges at different elevations, were published; all of them egregiously fallacious, and utterly irreconcilable with the motions of these bodies. Very few of the ancients indeed refrained from indulging themselves in speculations concerning the difference betwixt natural, violent, and mixed motions; although scarce any two of them could agree in their theories.

It is strange, however, that, during all these con-
Experiments by different persons on the ranges of artillery.
tests, so few of those who were intrusted with the charge of artillery thought it worth while to bring these theories to the test of experiment. Mr Robins informs us, in his Preface to the *New Principles of Gunnery*, that he had met with no more than four authors who had treated on this subject. The first of these is Collado, who has given the ranges of a falconet carrying a three-pound shot to each point of the gunner's quadrant. But from his numbers it is manifest, that the piece was not charged with its customary allotment of gun-powder. The results of his trials were, that the point-blank shot, or that in which the path of the ball did not sensibly deviate from a right line, extended 268 paces. At an elevation of one point (or $7^{\circ}\frac{1}{2}$ of the gunner's quadrant) the range was 594 paces; at an elevation of two points, 794 paces; at three points, 954 paces; at four, 1010; at five, 1040; and at six, 1053 paces. At the seventh point, the range fell between those of the third and fourth; at the eighth point, it fell between the ranges of the second and third; at the ninth point, it fell between the ranges of the first and second; at the tenth point, it fell between the point-blank distance and that of the first point; and at the eleventh point, it fell very near the piece.—The paces spoke of by this author are not geometrical ones, but common steps.

The year after Collado's treatise, another appeared on the same subject by one Bourne an Englishman. His elevations were not regulated by the points of the gunner's quadrant, but by degrees; and he ascertains the proportions between the ranges at different elevations and the extent of point-blank shot. According to him, if the extent of the point-blank shot be represented by 1, the range at 5° elevation will be $2\frac{2}{3}$, at 10° it will be $3\frac{1}{3}$, at 15° it will be $4\frac{1}{3}$, at 20° it will be $4\frac{2}{3}$, and the greatest random will be $5\frac{1}{3}$. This last, he tells us, is in a calm day when the piece is elevated to 42° ; but according to the strength of the wind, and as it favours or opposes the flight of the shot, it may be from 45° to 36° .—He hath not informed us with what piece he made his trials; though by his proportions it seems to have been a small one. This however ought to have been attended to, as the relation between the extent of different ranges varies extremely according to the velocity and density of the bullet.

After him Eldred and Anderson, both Englishmen, published treatises on this subject. The first published

GUNNERY.

Plate C CXXIV.

^{Theory.} lished his treatise in 1646, and has given the actual ranges of different pieces of artillery at small elevations all under ten degrees. His principles were not rigorously true, though not liable to very considerable errors; yet, in consequence of their deviation from the truth, he found it impossible to make some of his experiments agree with his principles.

⁴ Galileo's theory. In 1638, Galileo printed his dialogues on motion. In these he pointed out the general laws observed by nature in the production and composition of motion; and was the first who described the action and effects of gravity on falling bodies. On these principles he determined, that the flight of a cannon shot, or any other projectile, would be in the curve of a parabola, except in as far as it was diverted from that track by the resistance of the air. He has also proposed the means of examining the inequalities which arise from thence, and of discovering what sensible effects that resistance would produce in the motion of a bullet at some given distance from the piece.

Though Galileo had thus shown, that, independent of the resistance of the air, all projectiles would, in their flight, describe the curve of a parabola; yet those who came after him, seem never to have imagined that it was necessary to consider how far the operations of gunnery were affected by this resistance. The subsequent writers indeed boldly asserted, without making the experiment, that no considerable variation could arise from the resistance of the air in the flight of shells or cannon shot. In this persuasion they supported themselves chiefly by considering the extreme rarity of the air, compared with those dense and ponderous bodies; and at last it became an almost generally established maxim, that the flight of these bodies was nearly in the curve of a parabola.

⁵ New theory by Anderson. In 1674, Mr Anderson above-mentioned published his treatise on the nature and effects of the gun; in which he proceeds on the principles of Galileo, and strenuously asserts, that the flight of all bullets is in the curve of a parabola; undertaking to answer all objections that could be brought to the contrary. The same thing was also undertaken by Mr Blondel, in a treatise published at Paris in 1683; where, after long discussion, the author concludes, that the variations from the air's resistance are so slight as scarce to merit notice. The same subject is treated of in the Philosophical Transactions, N^o 216. p. 68. by Dr Halley; and he also, swayed by the very great disproportion between the density of the air and that of iron or lead, thinks it reasonable to believe, that the opposition of the air to large metal shot is scarcely discernible; although in small and light shot he owns that it must be accounted for.

But though this hypothesis went on smoothly in speculation; yet Anderson, who made a great number of trials, found it impossible to support it without some new modification. For though it does not appear that he ever examined the comparative ranges of either cannon or musket shot when fired with their usual velocities, yet his experiments on the ranges of shells thrown with small velocities (in comparison of those above-mentioned), convinced him that their whole tract was not parabolical. But instead of making the proper inferences from hence, and concluding the resistance of the air to be of considerable efficacy, he

framed a new hypothesis; which was, that the shell or bullet, at its first discharge, flew to a certain distance in a right line, from the end of which line only it began to describe a parabola. And this right line, which he calls the *line of the impulse of the fire*, he supposes to be the same in all elevations. Thus, by assigning a proper length to this line of impulse, it was always in his power to reconcile any two shots made at different angles, let them differ as widely as we please to suppose. But this he could not have done with three shots; nor indeed doth he ever tell us the event of his experiments when three ranges were tried at one time.

When Sir Isaac Newton's *Principia* was published, he particularly considered the resistance of the air to projectiles which moved with small velocities; but as he never had an opportunity of making experiments on those which move with such prodigious swiftness, he did not imagine that a difference in velocity could make such differences in the resistance as are now found to take place. Sir Isaac found, that, in small velocities, the resistance was increased in the duplicate proportion of the swiftness with which the body moved; that is, a body moving with twice the velocity of another of equal magnitude, would meet with four times as much resistance as the first, with thrice the velocity it would meet with nine times the resistance, &c.—This principle itself is now found to be erroneous with regard to military projectiles; though, if it had been properly attended to, the resistance of the air might even from thence have been reckoned much more considerable than was commonly done. So far, however, were those who treated this subject scientifically, from giving a proper allowance for the resistance of the atmosphere, that their theories differed most egregiously from the truth. Huygens alone seems to have attended to this principle: for, in the year 1690, he published a treatise on Gravity, in which he gave an account of some experiments tending to prove, that the track of all projectiles moving with very swift motions was widely different from that of a parabola. All the rest of the learned acquiesced in the justness of Galileo's doctrine, and very erroneous calculations concerning the ranges of cannon were accordingly given. Nor was any notice taken of these errors till the year 1716. At that time Mr Resson, a French officer of artillery, distinguished by the number of sieges at which he had served, by his high military rank, and by his abilities in his profession, gave in a memoir to the Royal Academy, of which he was a member, importing, that, "although it was agreed, that theory joined with practice did constitute the perfection of every art; yet experience had taught him, that theory was of very little service in the use of mortars: That the works of M. Blondel had justly enough described the several parabolic lines, according to the different degrees of the elevation of the piece; but that practice had convinced him, there was no theory in the effect of gunpowder; for having endeavoured, with the greatest precision, to point a mortar agreeably to these calculations, he had never been able to establish any solid foundation upon them."

From the history of the academy, it doth not appear that the sentiments of Mr Resson were at any time controverted, or any reason offered for the failure of the

Theory

gunpow-
der.

the theory of projectiles when applied to use. Nothing farther, however, was done till the time of Benjamin Robins, who in 1742 published a treatise, intitled, *New Principles of Gunnery*, in which he hath treated particularly not only of the resistance of the atmosphere, but almost every thing else relating to the flight of military projectiles, and indeed advanced the theory of gunnery much nearer perfection than ever it was before.

The first thing considered by Mr Robins, and which is indeed the foundation of all other particulars relative to gunnery, is the explosive force of gunpowder. This he determined to be owing to an elastic fluid similar to our atmosphere, having its elastic force greatly increased by the heat. "If a red-hot iron (says he) be included in a receiver, and the receiver be exhausted, and gunpowder be then let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of powder which was let fall on the iron.—The same production likewise takes place when gunpowder is fired in the air: for if a small quantity of powder is placed in the upper part of a glass tube, the lower part of which is immersed in water, and the fluid be made to rise so near the top, that only a small portion of air is left in that part where the gunpowder is placed; if in this situation the communication of the upper part of the tube with the external air is closed, and the gunpowder fired, which may be easily done by means of a burning-glass, the water will in this experiment descend on the explosion, as the quicksilver did in the last; and will always continue depressed below the place at which it stood before the explosion. The quantity of this depression will be greater if the quantity of powder be increased, or the diameter of the tube be diminished.

"When any considerable quantity of gunpowder is fired in an exhausted receiver, by being let fall on a red-hot iron, the mercurial gage instantly descends upon the explosion, and as suddenly ascends again. After a few vibrations, none of which except the first are of any great extent, it seemingly fixes at a point lower than where it stood before the explosion. But even when the gage has acquired this point of apparent rest, it still continues rising for a considerable time, although by such imperceptible degrees, that it can only be discovered by comparing its place at distant intervals: however, it will not always continue to ascend; but will rise slower and slower, till at last it will be absolutely fixed at a point lower than where the mercury stood before the explosion. The same circumstances nearly happen, when powder is fired in the upper part of an unexhausted tube, whose lower part is immersed in water.

"That the elasticity or pressure of the fluid produced by the firing of gunpowder is, *ceteris paribus*, directly as its density, may be proved from hence, that if in the same receiver a double quantity of powder be let fall, the mercury will subside twice as much as in the firing of a single quantity. Also the descents of the mercury, when equal quantities of powder are fired in different receivers, are reciprocally as the capacities of those receivers, and consequently as the density of

produced fluid in each. But as, in the usual method of trying this experiment, the quantities of powder are so very small that it is difficult to ascertain these proportions with the requisite degree of exactness, I took a large receiver containing about 520 inches, and letting fall at once on the red-hot iron one drachm or the sixteenth part of an ounce avoirdupois of powder, the receiver being first nearly exhausted; the mercury, after the explosion, was subsided two inches exactly, and all the powder had taken fire. Then heating the iron a second time, and exhausting the receiver as before, two drachms were let down at once, which sunk the mercury three inches and three quarters; and a small part of the powder had fallen beside the iron, which (the bottom of the receiver being wet) did not fire, and the quantity which thus escaped did appear to be nearly sufficient, had it fallen on the iron, to have sunk the mercury a quarter of an inch more; in which case the two descents, viz. two inches and four inches, would have been accurately in the proportion of the respective quantities of powder; from which proportion, as it was, they very little varied.

"As different kinds of gunpowder produce different quantities of this fluid, in proportion to their different degrees of goodness, before any definite determination of this kind can take place, it is necessary to ascertain the particular species of powder that is proposed to be used. (Here Mr Robins determines in all his experiments to make use of government-powder, as consisting of a certain and invariable proportion of materials, and therefore preferable to such kinds as are made according to the fancy of private persons.)

"This being settled, we must further premise these two principles: 1. That the elasticity of this fluid increases by heat and diminishes by cold, in the same manner as that of the air; 2. That the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air, having the same elasticity and the same temperature. Now from the last experiment it appears, that $\frac{1}{8}$ of an ounce avoirdupois or about 27 grains Troy of powder, sunk the gage, on its explosion, two inches; and the mercury in the barometer standing at near 30 inches, $\frac{1}{8}$ ths of an ounce avoirdupois, or 410 grains Troy, would have filled the receiver with a fluid whose elasticity would have been equal to the whole pressure of the atmosphere, or the same with the elasticity of the air we breathe; and the content of the receiver being about 520 cubic inches, it follows, that $\frac{1}{8}$ ths of an ounce of powder will produce 520 cubic inches of a fluid possessing the same degree of elasticity with the common air; whence an ounce of powder will produce near 575 cubic inches of such a fluid.

"But in order to ascertain the density of this fluid, we must consider what part of its elasticity, at the time of this determination, was owing to the heat it received from the included hot-iron and the warm receiver. Now the general heat of the receiver being manifestly less than that of boiling water, which is known to increase the elasticity of the air to somewhat more than $\frac{1}{4}$ of its augmented quantity; I collect from hence and other circumstances, that the augmentation of elasticity from this cause was about $\frac{1}{7}$ of the whole: that is, if the fluid arising from the explosion had been reduced to the temperature of the external air, the descent of
the

Theory.

Theory.

the mercurial gage, instead of two inches, would have been only $1\frac{1}{2}$ inch; whence 575, reduced in the proportion of five to four, becomes 460; and this last number represents the cubic inches of an elastic fluid equal in density and elasticity with common air, which are produced from the explosion of 1 ounce avoirdupois of gunpowder; the weight of which quantity of fluid, according to the usual estimation of the weight of air, is 131 grains; whence the weight of this fluid is $\frac{1}{4}\frac{1}{3}$ or $\frac{3}{10}$ ths nearly of the weight of the generating powder. The ratio of the bulk of gunpowder to the bulk of this fluid may be determined from considering that 17 drams avoirdupois of powder fill two cubic inches, if the powder be well shook together: therefore, augmenting the number last found in the proportion of 16 to 17, the resulting term $488\frac{1}{2}$ is the number of cubic inches of an elastic fluid, equal in density with the air produced from two cubic inches of powder: whence the ratio of the respective bulk of the powder, and of the fluid produced from it, is in round numbers as 1 to 244."—This calculation was afterwards justified by experiments.

"If this fluid, instead of expanding when the powder was fired, had been confined in the same space which the powder filled before the explosion; then it would have had, in that confined state, a degree of elasticity 244 times greater than that of common air; and this independent of the great augmentation this elasticity would receive from the action of the fire in that instant.

"Hence, then, we are certain, that any quantity of powder, fired in a confined space, which it adequately fills, exerts, at the instant of its explosion, against the sides of the vessel containing it, and the bodies it impels before it, a force at least 244 times greater than the elasticity of the common air, or, which is the same thing, than the pressure of the atmosphere; and this without considering the great addition which this force will receive from the violent degree of heat with which it is affected at that time.

"To determine how far the elasticity of air is augmented when heated to the extremest degree of red-hot iron, I took a piece of a musket-barrel about six inches in length, and ordered one end to be closed up entirely; but the other end was drawn out conically, and finished in an aperture of about $\frac{1}{8}$ of an inch in diameter. The tube thus fitted, was heated to the extremity of a red heat in a smith's forge; and was then immersed with its aperture downwards in a bucket of water, and kept there till it was cool; after which it was taken out carefully, and the water which had entered it in cooling was exactly weighed. The heat given to the tube at each time, was the beginning of what workmen call a *white heat*; and to prevent the rushing in of the aqueous vapour at the immersion, which would otherwise drive out great part of the air, and render the experiment fallacious, I had an iron wire filed tapering, so as to fit the aperture of the tube, and with this I always stopped it up before it was taken from the fire, letting the wire remain in till the whole was cool, when, removing it, the due quantity of water would enter. The weight of the water thus taken in at three different trials was 610 grains, 595 grains, and 600 grains, respectively. The content of the whole cavity of the tube was 796 grains of water; whence

Theory.

the spaces remaining unfilled in these three experiments were 186, 201, and 196 grains respectively. These spaces undoubtedly contained all the air which, when the tube was red-hot, extended through its whole concavity; consequently the elasticity of the air, when heated to the extreme heat of red-hot iron, was to the elasticity of the same air, when reduced to the temperature of the ambient atmosphere, as the whole capacity of the tube to the respective spaces taken up by the cooled air; that is, as 796 to 186, 201, 196; or, taking the medium of these three trials, as 796 to 194 $\frac{1}{2}$.

"As air and this fluid appear to be equally affected by heat and cold, and consequently have their elasticities equally augmented by the addition of equal degrees of heat to each; if we suppose the heat with which the flame of fired powder is endowed to be the same with that of the extreme heat of red-hot iron, then the elasticity of the generated fluid will be greater at the time of the explosion than afterwards, when it is reduced to the temperature of the ambient air, in the ratio of 796 to 194 $\frac{1}{2}$ nearly. It being allowed then, (which surely is very reasonable), that the flame of gunpowder is not less hot than red-hot iron, and the elasticity of the air, and consequently of the fluid generated by the explosion, being augmented in the extremity of this heat in the ratio of 194 $\frac{1}{2}$ to 796, it follows, that if 244 be augmented in this ratio, the resulting number, which is 999 $\frac{1}{2}$, will determine how many times the elasticity of the flame of fired powder exceeds the elasticity of common air, supposing it to be confined in the same space which the powder filled before it was fired.—Hence then the absolute quantity of the pressure exerted by gunpowder at the moment of its explosion may be assigned; for, since the fluid then generated has an elasticity of 999 $\frac{1}{2}$, or in round numbers 1000 times greater than that of the atmosphere, and since common air by its elasticity exerts a pressure on any given surface equal to the weight of the incumbent atmosphere with which it is in equilibrio, the pressure exerted by fired powder before it dilated itself is 1000 times greater than the pressure of the atmosphere: and consequently the quantity of this force, on a surface of an inch square, amounts to above six ton weight; which force, however, diminishes as the fluid dilates itself.

It
Prodigious
power of
fired powder.

"But though we have here supposed that the heat of gunpowder, when fired in any considerable quantity, is the same with iron heated to the extremity of red heat, or to the beginning of a white heat, yet it cannot be doubted but that the fire produced in the explosion is somewhat varied (like all other fires) by a greater or lesser quantity of fuel; and it may be presumed, that, according to the quantity of powder fired together, the flame may have all the different degrees, from a languid red heat to that sufficient for the vitrification of metals. But as the quantity of powder requisite for the production of this last mentioned heat, is certainly greater than what is ever fired together for any military purpose, we cannot be far from our scope, if we suppose the heat of such quantities as are usually fired to be nearly the same with that of red-hot iron; allowing a gradual augmentation to this heat in larger quantities, and diminishing it when the quantities are very small."

Having

Theory.

12
Mr Robins's method of determining the velocities of balls.

Having thus determined the force of the gunpowder, Mr Robins next proceeds to determine the velocity with which the ball is discharged. The solution of this problem depends on the two following principles. 1. That the action of the powder on the bullet ceases as soon as the bullet is got out of the piece. 2. That all the powder of the charge is fired and converted into elastic fluid before the bullet is sensibly moved from its place.

"The first of these (says Mr Robins) will appear manifest when it is considered how suddenly the flame will extend itself on every side, by its own elasticity, when it is once got out of the mouth of the piece; for by this means its force will then be dissipated, and the bullet no longer sensibly affected by it.

13
Instantaneous firing of powder.

"The second principle is indeed less obvious, being contrary to the general opinion of almost all writers on this subject. It might, however, be sufficient for the proof of this position, to observe the prodigious compression of the flame in the chamber of the piece. Those who attend to this circumstance, and to the easy passage of the flame through the intervals of the grains, may soon satisfy themselves, that no one grain contained in that chamber can continue for any time uninflamed, when thus surrounded and pressed by such an active fire. However, not to rely on mere speculation in a matter of so much consequence, I considered, that if part only of the powder is fired, and that successively; then by laying a greater weight before the charge (suppose two or three bullets instead of one), a greater quantity of powder would necessarily be fired, since a heavier weight would be a longer time in passing through the barrel. Whence it should follow, that two or three bullets would be impelled by a much greater force than one only. But the contrary to this appears by experiment; for firing one, two, and three bullets laid contiguous to each other with the same charge respectively, I have found that their velocities were not much different from the reciprocal of their subduplicate quantities of matter; that is, if a given charge would communicate to one bullet a velocity of 1700 feet in a second, the same charge would communicate to two bullets a velocity from 1250 to 1300 feet in a second, and to three bullets a velocity from 1050 to 1110 feet in the same time. From hence it appears, that, whether a piece is loaded with a greater or less weight of bullet, the action is nearly the same; since all mathematicians know, that if bodies containing different quantities of matter are successively impelled through the same space by the same power acting with a determined force at each point of that space; then the velocities given to these different bodies will be reciprocally in the subduplicate ratio of their quantities of matter. The excess of the velocities of the two and three bullets above what they ought to have been by this rule (which are that of 1200 and 980 feet in a second), undoubtedly arises from the flame, which, escaping by the side of the first bullet, acts on the surface of the second and third.

14
Why some powder is blown out of the mouth of a cannon without being fired.

"Now, this excess has in many experiments been imperceptible, and the velocities have been reciprocally in the subduplicate ratios of the number of bullets, to sufficient exactness; and where this error has been greater, it has never arisen to an eighth part of

No 145.

the whole: but if the common opinion was true, that a small part only of the powder fires at first, and other parts of it successively as the bullet passes through the barrel, and that a considerable part of it is often blown out of the piece without firing at all; then the velocity which three bullets received from the explosion ought to have been much greater than we have found it to be.—But the truth of this second postulate more fully appears from those experiments, by which it is shown, that the velocities of bullets may be ascertained to the same exactness when they are acted on through a barrel of four inches in length only, as when they are discharged from one of four feet.

"With respect to the grains of powder which are often blown out unfired, and which are always urged as a proof of the gradual firing of the charge, I believe Diego Uffano, a person of great experience in the art of gunnery, has given the true reason for this accident; which is, that some small part of the charge is often not rammed up with the rest, but is left in the piece before the wad, and is by this means expelled by the blast of air before the fire can reach it. I must add, that, in the charging of cannon and small arms, especially after the first time, this is scarcely to be avoided by any method I have yet seen practised. Perhaps, too, there may be some few grains in the best powder, of such an heterogeneous composition as to be less susceptible of firing; which, I think, I have myself observed: and these, though they are surrounded by the flame, may be driven out unfired.

"These postulates being now allowed to be just, let AB represent the axis of any piece of artillery, A the breech, and B the muzzle; DC the diameter of its bore, and DEGC a part of its cavity filled with powder. Suppose the ball that is to be impelled to lie with its hinder surface at the line GE; then the pressure exerted at the explosion on the circle of which GE is the diameter, or, which is the same thing, the pressure exerted in the direction FB on the surface of the ball, is easily known from the known dimensions of that circle. Draw any line FH perpendicular to FB, and AI parallel to FH; and through the point H, to the asymptotes IA and AB, describe the hyperbola KHNQ; then, if FH represents the force impelling the ball at the point F, the force impelling the ball at any other point as at M, will be represented by the line MN, the ordinate to the hyperbola at that point. For when the fluid impelling the body along has dilated itself to M, its density will be then to its original density in the space DEGC reciprocally as the spaces through which it is extended; that is, as FA to MA, or as MN to FH; but it has been shown, that the impelling force or elasticity of this fluid is directly as its density; therefore, if FH represents the force at the point F, MN will represent the like force at the point M.

"Since the absolute quantity of the force impelling the ball at the point F is known, and the weight of the ball is also known, the proportion between the force with which the ball is impelled and its own gravity is known. In this proportion take FH to FL, and draw LP parallel to FB; then, MN the ordinate to the hyperbola in any point will be to its part MR, cut off by the line LP, as the impelling force of the powder in that point M to the gravity of the ball; and con-

Theory. consequently the line LP will determine a line proportional to the uniform force of gravity in every point; whilst the hyperbola HNQ determines in like manner such ordinates as are proportional to the impelling force of the powder in every point; whence by the 39th Prop. of lib 1. of Sir Isaac Newton's Principia, the areas FLPB and FHQB are in the duplicate proportion of the velocities which the ball would acquire when acted upon by its own gravity through the space FB, and when impelled through the same space by the force of the powder. But since the ratio of AF to AB and the ratio of FH to FL are known, the ratio of the area FLPB to the area FHQB is known; and thence its subduplicate. And since the line FB is given in magnitude, the velocity which a heavy body would acquire when impelled through this line by its own gravity is known; being no other than the velocity it would acquire by falling through a space equal to that line: find then another velocity to which this last mentioned velocity bears the given ratio of the subduplicate of the area FLPB to the area FHQB; and this velocity thus found is the velocity the ball will acquire when impelled through the space FB by the action of the inflamed powder.

"Now to give an example of this: Let us suppose AB, the length of the cylinder, to be 45 inches, its diameter DC, or rather the diameter of the ball, to be $\frac{1}{4}$ ths of an inch; and AF, the extent of the powder, to be $2\frac{1}{8}$ th inches; to determine the velocity which will be communicated to a leaden bullet by the explosion, supposing the bullet to be laid at first with its surface contiguous to the powder.

"By the theory we have laid down, it appears, that at the first instant of the explosion the flame will exert, on the bullet lying close to it, a force 1000 times greater than the pressure of the atmosphere. The medium pressure of the atmosphere is reckoned equal to a column of water 33 feet in height; whence, lead being to water as 11,345 to 1, this pressure will be equal to that of a column of lead 34.9 inches in height. Multiplying this by 1000, therefore, a column of lead 34900 inches (upwards of half a mile) in height, would produce a pressure on the bullet equal to what is exerted by the powder in the first instant of the explosion; and the leaden ball being $\frac{1}{4}$ ths of an inch in diameter, and consequently equal to a cylinder of lead of the same base half an inch in height, the pressure at first acting on it will be equal to 34900×2 , or 69800 times its weight: whence FL to FH as 1 to 69800; and FB to FA as $45 - 2\frac{1}{8}$; or $42\frac{3}{8}$ to $2\frac{1}{8}$; that is, as 339 to 21; whence the rectangle FLPB is to the rectangle AFHS as 339 to 21×69800 , that is, as 1 to 4324.—And from the known application of the logarithms to the mensuration of the hyperbolic spaces it follows, that the rectangle AFHS is to the area FHQB

as 43,429, &c. is to the tabular logarithm of $\frac{AB}{AF}$; that is, of $\frac{45}{2\frac{1}{8}}$ which is 1,2340579; whence the ratio of the rectangle FLPB to the hyperbolic area FHQB is compounded of the ratios of 1 to 4324— and of 43429, &c. to 1,2340579; which together make up the ratio of 1 to 12263, the subduplicate of which is the ratio of 1 to 110.7; and in this ratio is the velocity which the bullet would acquire by gravity in fall-

VOL. VIII. Part I.

ing through a space equal to FB, to the velocity the bullet will acquire from the action of the powder impelling it through FB. But the space FB being $42\frac{3}{8}$ inches, the velocity a heavy body will acquire in falling through such a space is known to be what would carry it nearly at the rate of 15.07 feet in a second; whence the velocity to which this has the ratio of 1 to 110.7 is a velocity which would carry the ball at the rate of 1668 feet in one second. And this is the velocity which, according to the theory, the bullet in the present circumstances would acquire from the action of the powder during the time of its dilatation.

"Now this velocity being once computed for one case, is easily applied to any other; for if the cavity DEGC left behind the bullet be only in part filled with powder, then the line HF, and consequently the area FHQB will be diminished in the proportion of the whole cavity to the part filled. If the diameter of the bore be varied, the lengths AB and AF remaining the same, then the quantity of powder and the surface of the bullet which it acts on, will be varied in the duplicate proportion of the diameter, but the weight of the bullet will vary in the triplicate proportion of the diameter; wherefore the line FH, which is directly as the absolute impelling force of the powder, and reciprocally as the gravity of the bullet, will change in the reciprocal proportion of the diameter of the bullet. If AF, the height of the cavity left behind the bullet be increased or diminished, the rectangle of the hyperbola, and consequently the area corresponding to ordinates in any given ratio, will be increased or diminished in the same proportion. From all which it follows, that the area FHQB, which is in the duplicate proportion of the velocity of the impelled body, will be directly as the logarithm $\frac{AB}{AF}$ (where AB re-

presents the length of the barrel, and AF the length of the cavity left behind the bullet); also directly as the part of that cavity filled with powder; and inversely, as the diameter of the bore, or rather of the bullet, likewise directly as AF, the height of the cavity left behind the bullet. Consequently the velocity being computed as above, for a bullet of a determined diameter, placed in a piece of a given length, and impelled by a given quantity of powder, occupying a given cavity behind that bullet; it follows, that by means of these ratios, the velocity of any other bullet may be thence deduced; the necessary circumstances of its position, quantity of powder, &c. being given. Where note, That in the instance of this supposition, we have supposed the diameter of the ball to be $\frac{1}{4}$ ths of an inch; whence the diameter of the bore will be something more, and the quantity of powder contained in the space DEGC will amount exactly to 12 pennyweight, a small wad of tow included.

"In order to compare the velocities communicated to bullets by the explosion, with the velocities resulting from the theory by computation, it is necessary that the actual velocities with which bullets move should be discovered. The only methods hitherto practised for this purpose, have been either by observing the time of the flight of a shot through a given space, or by measuring the range of a shot at a given elevation; and thence computing, on the parabolic hypothesis,

B b

Theory.

Theory. thefis, what degree of velocity would produce this range.—The first method labours under this insurmountable difficulty, that the velocities of these bodies are often so swift, and consequently the time observed is so short, that an imperceptible error in that time may occasion an error in the velocity thus found of 2, 3, 4, 5, or 600 feet, in a second. The other method is so fallacious, by reason of the resistance of the atmosphere (to which inequality the first is also liable), that the velocities thus assigned may not perhaps be the tenth part of the actual velocities sought.

16
Machine
discovering
the veloci-
ties of bul-
lets.

“The simplest method of determining this velocity is by means of the instrument represented fig. 2. where ABCD represents the body of the machine composed of the three poles B, C, D, spreading at bottom, and joining together at the top A; being the same with what is vulgarly used in lifting and weighing very heavy bodies, and is called by workmen the *triangles*. On two of these poles, towards their tops, are screwed on the sockets RS; and on these sockets the pendulum EFGHIK is hung by means of its cross-piece EF, which becomes its axis of suspension, and on which it must be made to vibrate with great freedom. The body of this pendulum is made of iron, having a broad part at bottom, and its lower part is covered with a thick piece of wood GKIH, which is fastened to the iron by screws. Something lower than the bottom of the pendulum there is a brace OP, joining the two poles to which the pendulum is suspended; and to this brace there is fastened a contrivance MNU, made with two edges of steel, bearing on each other in the line UN, something in the manner of a drawing-pen; the strength with which these edges press on each other being diminished or increased at pleasure by means of a screw Z going through the upper piece. There is fastened to the bottom of the pendulum a narrow ribbon LN, which passes between these steel edges, and which afterwards, by means of an opening cut in the lower piece of steel, hangs loosely down, as at W.

17
Method of
using the
machine.

“This instrument thus fitted, if the weight of the pendulum be known, and likewise the respective distances of its centre of gravity, and of its centre of oscillation from its axis of suspension, it will thence be known what motion will be communicated to this pendulum by the percussion of a body of a known weight moving with a known degree of celerity, and striking it in a given point; that is, if the pendulum be supposed at rest before the percussion, it will be known what vibration it ought to make in consequence of such a determined blow; and, on the contrary, if the pendulum, being at rest, is struck by a body of a known weight, and the vibration which the pendulum makes after the blow is known, the velocity of the striking body may from thence be determined.

“Hence then, if a bullet of a known weight strikes the pendulum, and the vibration, which the pendulum makes in consequence of the stroke, be ascertained; the velocity with which the ball moved is thence to be known.

“Now the extent of the vibration made by the pendulum after the blow, may be measured to great accuracy by the ribbon LN. For let the pressure of the edges UN on the ribbon be so regulated by the screw Z, that the motion of the ribbon between them may

be free and easy, though with some minute resistance; then settling the pendulum at rest, let the part LN between the pendulum and the edges be drawn strait, but not strained, and fix a pin in that part of the ribbon which is then contiguous to the edges: let now a ball impinge on the pendulum; then the pendulum swinging back will draw out the ribbon to the just extent of its vibration, which will consequently be determined by the interval on the ribbon between the edges UN and the place of the pin.

“The weight of the whole pendulum, wood and all, was 56 lb. 3 oz. its centre of gravity was 52 inches distant from its axis of suspension, and 200 of its small swings were performed in the time of 253 seconds; whence its centre of oscillation (determined from hence) is $62\frac{1}{2}$ inches distant from that axis. The centre of the piece of wood GKIH is distant from the same axis 66 inches.

“In the compound ratio of 66 to $62\frac{1}{2}$, and 66 to 52, take the quantity of matter of the pendulum to a 4th quantity, which will be 42 lb. $\frac{1}{2}$ oz. Now geometers will know, that if the blow be struck on the centre of the piece of wood GKIH, the pendulum will resist to the stroke in the same manner as if this last quantity of matter only (42 lb. $\frac{1}{2}$ oz.) was concentrated in that point, and the rest of the pendulum was taken away: whence, supposing the weight of the bullet impinging in that point to be the $\frac{1}{12}$ th of a pound, or the $\frac{1}{3024}$ th of this quantity of matter nearly, the velocity of the point of oscillation after the stroke will, by the laws observed in the congress of such bodies as rebound not from each other, be the $\frac{1}{864}$ th of the velocity the bullet moved with before the stroke; whence the velocity of this point of oscillation after the stroke being ascertained, that multiplied by 505 will give the velocity with which the ball impinged.

“But the velocity of the point of oscillation after the stroke is easily deduced from the chord of the arch, through which it ascends by the blow; for it is a well-known proposition, that all pendulous bodies ascend to the same height by their vibratory motion as they would do, if they were projected directly upwards from their lowest point, with the same velocity they have in that point: wherefore, if the versed sine of the ascending arch be found (which is easily determined from the chord and radius being given), this versed sine is the perpendicular height to which a body projected upwards with the velocity of the point of oscillation would arise; and consequently what that velocity is, can be easily computed by the common theory of falling bodies.

“For instance, the chord of the arch, described by the ascent of the pendulum after the stroke measured on the ribbon, has been sometimes $17\frac{1}{4}$ th inches; the distance of the ribbon from the axis of suspension is $71\frac{1}{8}$ th inches; whence reducing $17\frac{1}{4}$ th in the ratio of $71\frac{1}{8}$ th to 66, the resulting number, which is nearly 16 inches, will be the chord of the arch through which the centre of the board GKIH ascended after the stroke; now the versed sine of the arch, whose chord is 16 inches, and its radius 66, is 1.93939; and the velocity which would carry a body to this height, or, which is the same thing, the velocity which a body would acquire by descending through this space, is nearly that of $3\frac{1}{4}$ th feet in 1”.

“To

Theory.

Theory.

"To determine then the velocity with which the bullet impinged on the centre of the wood, when the chord of the arch described by the ascent of the pendulum, in consequence of the blow, was $17\frac{1}{4}$ th inches measured on the ribbon, no more is necessary than to multiply $3\frac{1}{4}$ th by 505, and the resulting number 1641 will be the feet which the bullet would describe in 1", if it moved with the velocity it had at the moment of its percussion: for the velocity of the point of the pendulum, on which the bullet struck, we have just now determined to be that of $3\frac{1}{4}$ th feet in 1"; and we have before shown, that this is the $\frac{1}{8}$ th of the velocity of the bullet. If then a bullet weighing $\frac{1}{16}$ th of a pound strikes the pendulum in the centre of the wood GKIH, and the ribbon be drawn out $17\frac{1}{4}$ th inches by the blow; the velocity of the bullet is that of 1641 feet in 1". And since the length the ribbon is drawn is always nearly the chord of the arch described by the ascent, (it being placed so as to differ insensibly from those chords which most frequently occur), and these chords are known to be in the proportion of the velocities of the pendulum acquired from the stroke; it follows, that the proportion between the lengths of ribbon drawn out at different times, will be the same with that of the velocities of the impinging bullets; and consequently, by the proportion of these lengths of ribbon to $17\frac{1}{4}$ th, the proportion of the velocity with which the bullets impinge, to the known velocity of 1641 feet in 1", will be determined.

18
Cautions to be observed in making these experiments.

"Hence then is shown in general how the velocities of bullets of all kinds may be found out by means of this instrument; but that those who may be disposed to try these experiments may not have unforeseen difficulties to struggle with, we shall here subjoin a few observations, which it will be necessary for them to attend to, both to secure success to their trials and safety to their persons.

"And first, that they may not conceive the piece of wood GKIH to be an unnecessary part of the machine, we must inform them, that if a bullet impelled by a full charge of powder should strike directly on the iron, the bullet would be beaten into shivers by the stroke, and these shivers will rebound back with such violence, as to bury themselves in any wood they chance to light on, as I have found by hazardous experience; and besides the danger, the pendulum will not in this instance ascertain the velocity of the bullet, because the velocity with which the parts of it rebound is unknown.

"The weight of the pendulum, and the thickness of the wood, must be in some measure proportioned to the size of the bullets which are used. A pendulum of the weight here described will do very well for all bullets under three or four ounces, if the thickness of the board be increased to seven or eight inches for the heaviest bullets; beech is the toughest and properest wood for this purpose.

"It is hazardous standing on the side of the pendulum, unless the board be so thick, that the greatest part of the bullet's force is lost before it comes at the iron; for if it strikes the iron with violence, the shivers of lead, which cannot return back through the wood, will force themselves out between the wood and iron, and will fly to a considerable distance.

"As there is no effectual way of fastening the wood

to the iron but by screws, the heads of which must come through the board; the bullets will sometimes light on those screws, from whence the shivers will disperse themselves on every side.

"When in these experiments so small a quantity of powder is used, as will not give to the bullet a velocity of more than 400 or 500 feet in 1"; the bullet will not stick in the wood, but will rebound from it entire, and (if the wood be of a very hard texture) with a very considerable velocity. Indeed I have never examined any of the bullets which have thus rebounded, but I have found them indented by the bodies they have struck against in their rebound.

"To avoid then these dangers, to the braving of which in philosophical researches no honour is annexed; it will be convenient to fix whatsoever barrel is used, on a strong heavy carriage, and to fire it with a little slow match. Let the barrel too be very well fortified in all its length; for no barrel (I speak of musket barrels) forged with the usual dimensions will bear many of the experiments without bursting. The barrel I have most relied on, and which I procured to be made on purpose, is nearly as thick at the muzzle as at the breech; that is, it has in each place nearly the diameter of its bore in thickness of metal.

"The powder used in these experiments should be exactly weighed: and that no part of it be scattered in the barrel, the piece must be charged with a ladle in the same manner as is practised with cannon; the wad should be of tow, of the same weight each time, and no more than is just necessary to confine the powder in its proper place: the length of the cavity left behind the ball should be determined each time with exactness; for the increasing or diminishing that space will vary the velocity of the shot, although the bullet and quantity of powder be not changed. The distance of the mouth of the piece from the pendulum ought to be such, that the impulse of the flame may not act on the pendulum; this will be prevented in a common barrel charged with $\frac{1}{2}$ an ounce of powder, if it be at the distance of 16 or 18 feet: in larger charges the impulse is sensible farther off; I have found it to extend to above 25 feet; however, between 25 and 18 feet is the distance I have usually chosen."

19
With this instrument, or others similar to it, Mr Account of Robins made a great number of experiments on barrels of different lengths, and with different charges of Mr Robins's experiments, powder. He hath given us the results of 61 of these; and having compared the actual velocities with the computed ones, his theory appears to have come as near the truth as could well be expected. In seven of the experiments there was a perfect coincidence; the charges of powder being six or twelve pennyweights; the barrels 45, 24.312, and 7.06 inches in length. The diameter of the first (marked A) was $\frac{3}{4}$ ths of an inch; of the second (B) was the same; and of D, $\frac{8}{16}$ of an inch. In the rest of the experiments, another barrel (C) was used, whose length was 12.375 inches, and the diameter of its bore $\frac{3}{4}$ th inches.—In 14 more of the experiments, the difference between the length of the chord of the pendulum's arch shown by the theory and the actual experiment was $\frac{1}{10}$ th of an inch over or under. This showed an error in the theory varying according to the different lengths of the chord from $\frac{1}{11}$ to $\frac{1}{47}$ of the whole; the charges of powder

Theory. were the same as in the last.—In 16 other experiments the error was $\frac{2}{10}$ ths of an inch, varying from $\frac{1}{8}$ th to $\frac{1}{4}$ th of the whole; the charges of powder were 6, 8, 9, or 12 pennyweights.—In seven other experiments, the error was $\frac{1}{10}$ ths of an inch, varying from $\frac{1}{8}$ th to $\frac{1}{4}$ th of the whole; the charges of powder six or twelve pennyweights. In eight experiments, the difference was $\frac{4}{10}$ ths of an inch, indicating an error from $\frac{1}{4}$ th to $\frac{1}{2}$ th of the whole; the charges being 6, 9, 12, and 24 pennyweights of powder. In three experiments, the error was $\frac{5}{10}$ ths, varying from $\frac{1}{3}$ th to $\frac{1}{2}$ th of the whole; the charges 8 and 12 pennyweights of powder. In two experiments the error was $\frac{6}{10}$ ths, in one case amounting to something less than $\frac{1}{2}$ th, in the other to $\frac{1}{2}$ th of the whole; the charges 12 and 36 pennyweights of powder. By one experiment the error was seven, and by another eight, tenths; the first amounting to $\frac{1}{10}$ th nearly, the latter to almost $\frac{1}{2}$ th of the whole: the charges of powder 6 or 12 pennyweights. The last error, however, Mr Robins ascribes to the wind. The two remaining experiments varied from theory by 1.3 inches, somewhat more than $\frac{1}{2}$ th of the whole: the charges of powder were 12 pennyweights in each; and Mr Robins ascribes the error to the dampness of the powder. In another case, he ascribes an error of $\frac{6}{10}$ ths to the blast of the powder on the pendulum.

20
His conclusions from them.

From these experiments Mr Robins deduces the following conclusions. “The variety of these experiments, and the accuracy with which they correspond to the theory, leave us no room to doubt of its certainty.—This theory, as here established, supposes, that, in the firing of gunpowder, about $\frac{1}{10}$ ths of its substance is converted by the sudden inflammation into a permanently elastic fluid, whose elasticity, in proportion to its heat and density, is the same with that of common air in the like circumstances; it farther supposes, that all the force exerted by gunpowder in its most violent operations, is no more than the action of the elasticity of the fluid thus generated; and these principles enable us to determine the velocities of bullets impelled from fire-arms of all kinds; and are fully sufficient for all purposes where the force of gunpowder is to be estimated.

“From this theory many deductions may be made of the greatest consequence to the practical part of gunnery. From hence the thickness of a piece, which will enable it to confine, without bursting, any given charge of powder, is easily determined, since the effort of the powder is known. From hence appears the inconclusiveness of what some modern authors have advanced, relating to the advantages of particular forms of chambers for mortars and cannon; for all their laboured speculations on this head are evidently founded on very erroneous opinions about the action of fired powder. From this theory too we are taught the necessity of leaving the same space behind the bullet when we would, by the same quantity of powder, communicate to it an equal degree of velocity; since, on the principles already laid down, it follows, that the same powder has a greater or less degree of elasticity, according to the different spaces it occupies. The method which I have always practised for this purpose has been by marking the rammer; and this is a maxim which ought not to be dispensed with when

cannon are fired at an elevation, particularly in those called by the French *batteries à ricochet*. Theory.

“From the continued action of the powder, and its manner of expanding described in this theory, and the length and weight of the piece, one of the most essential circumstances in the well directing of artillery may be easily ascertained. All practitioners are agreed, that no shot can be depended on, unless the piece be placed on a solid platform: for if the platform shakes with the first impulse of the powder, it is impossible but the piece must also shake: which will alter its direction, and render the shot uncertain. To prevent this accident, the platform is usually made extremely firm to a considerable depth backwards; so that the piece is not only well supported in the beginning of its motion, but likewise through a great part of its recoil. However, it is sufficiently obvious, that when the bullet is separated from the piece, it can be no longer affected by the trembling of the piece or platform; and, by a very easy computation, it will be found, that the bullet will be out of the piece before the latter hath recoiled half an inch: whence, if the platform be sufficiently solid at the beginning of the recoil, the remaining part of it may be much slighter; and hence a more compendious method of constructing platforms may be found out.

“From this theory also it appears how greatly these authors have been mistaken, who have attributed the force of gunpowder, or at least a considerable part of it, to the action of the air contained either in the powder or between the intervals of the grains: for they have supposed that air to exist in its natural elastic state, and to receive all its addition of force from the heat of the explosion. But from what hath been already delivered concerning the increase of the air's elasticity by heat, we may conclude that the heat of the explosion cannot augment this elasticity to five times its common quantity; consequently the force arising from this cause only cannot amount to more than the 200th part of the real force exerted on the occasion.

“If the whole substance of the powder was converted into an elastic fluid at the instant of the explosion, then from the known elasticity of this fluid assigned by our theory, and its known density, we could easily determine the velocity with which it would begin to expand, and could thence trace out its future augmentations in its progress through the barrel: but as we have shown that the elastic fluid, in which the activity of the gunpowder consists, is only $\frac{1}{10}$ ths of the substance of the powder, the remaining $\frac{9}{10}$ ths will, in the explosion, be mixed with the elastic part, and will by its weight retard the activity of the explosion; and yet they will not be so completely united as to move with one common motion; but the unelastic part will be less accelerated than the rest, and some will not even be carried out of the barrel, as appears by the considerable quantity of unctuous matter which adheres to the inside of all fire-arms after they have been used.—These inequalities in the expansive motion of the flame oblige us to recur to experiments for its accurate determination.

“The experiments made use of for this purpose were of two kinds. The first was made by charging the barrel A with 12 pennyweights of powder, and a small

powder.

small wad of tow only; and then placing its mouth 19 inches from the centre of the pendulum. On firing it in this situation, the impulse of the flame made it ascend through an arch whose chord was 13.7 inches; whence, if the whole substance of the powder was supposed to strike against the pendulum, and each part to strike with the same velocity, that common velocity must have been at the rate of about 2650 feet in a second.—But as some part of the velocity of the flame was lost in passing through 19 inches of air; I made the remaining experiments in a manner not liable to this inconvenience.

“ I fixed the barrel A on the pendulum, so that its axis might be both horizontal and also perpendicular to the plane HK; or, which is the same thing, that it might be in the plane of the pendulum's vibration: the height of the axis of the piece above the centre of the pendulum was six inches; and the weight of the piece, and of the iron that fastened it, &c. was 12½ lb. The barrel in this situation being charged with 12 penny-weights of powder, without either ball or wad, only put together with the rammer; on the discharge the pendulum ascended through an arch whose chord was 10 inches, or reduced to an equivalent blow in the centre of the pendulum, supposing the barrel away, it would be 14.4 inches nearly.—The same experiment being repeated, the chord of the ascending arch was 10.1 inches, which, reduced to the centre, is 14.6 inches.

“ To determine what difference of velocity there was in the different parts of the vapour, I loaded the piece again with 12 penny-weights of powder, and rammed it down with a wad of tow, weighing one penny-weight. Now, I conceived that this wad being very light, would presently acquire that velocity with which the elastic part of the fluid would expand itself when uncompressed; and I accordingly found, that the chord of the ascending arch was by this means increased to 12 inches, or at the centre to 17.3: whence, as the medium of the other two experiments is 14.5, the pendulum ascended through an arch 2.8 inches longer, by the additional motion of one penny-weight of matter, moving with the velocity of the swiftest part of the vapour; and consequently the velocity with which this penny-weight of matter moved, was that of about 7000 feet in a second.

“ It will perhaps be objected to this determination, that the augmentation of the arch through which the pendulum vibrated in this case was not all of it owing to the quantity of motion given to the wad, but part of it was produced by the confinement of the powder, and the greater quantity thereby fired. But if it were true that a part only of the powder fired when there was no wad, it would not happen that in firing different quantities of powder without a wad the chord would increase and decrease nearly in the ratio of these quantities; which yet I have found it to do: for with nine pennyweights that chord was 7.3 inches, which with 12 pennyweights we have seen was only 10, and 10.1 inches; and even with three pennyweights the chord was two inches; deficient from this proportion by .5 only; for which defect too other valid reasons are to be assigned.

“ And there is still a more convincing proof that

all the powder is fired, although no wad be placed before the charge, which is, that the part of the recoil arising from the expansion of powder alone, is found to be no greater when it impels a leaden bullet before it, than when the same quantity is fired without any wad to confine it. We have seen that the chord of the arch through which the pendulum rose from the expansive force of the powder alone is 10, or 10.1; and the chord of that arch, when the piece was charged in the customary manner with a bullet and wad, I found to be the first time 21½, and the second 22½, or at a medium 22.56. Now the impulse of the ball and wad, if they were supposed to strike the pendulum in the same place in which the barrel was suspended, with the velocity they had acquired at the mouth of the piece, would drive it through an arch whose chord would be about 12.3; as is known from the weight of the pendulum, the weight and position of the barrel, and the velocity of the bullet determined by our former experiments; whence, subtracting this number 12.3 from 22.56, the remainder 10.26 is nearly the chord of the arch which the pendulum would have ascended through from the expansion of the powder alone with a bullet laid before it. And this number, 10.26, differs but little from 10.1, which we have above found to be the chord of the ascending arch, when the same quantity of powder expanded itself freely without either bullet or wad before it.

“ Again, that this velocity of 7000 feet in a second is not much beyond what the most active part of the flame acquires in expanding, is evinced from hence, that in some experiments a ball has been found to be discharged with a velocity of 2400 feet in a second; and yet it appeared not that the action of the powder was at all diminished on account of this immense celerity: consequently the degree of swiftness with which, in this instance, the powder followed the ball without losing any part of its pressure, must have been much short of what the powder alone would have expanded with, had not the ball been there.

“ From these determinations may be deduced the force of petards; since their action depends entirely on the impulse of the flame: and it appears that a quantity of powder properly disposed in such a machine, may produce as violent an effort as a bullet of twice its weight, moving with a velocity of 1400 or 1500 feet in a second.

“ In many of the experiments already recited, the ball was not laid immediately contiguous to the powder, but at a small distance, amounting, at the utmost, only to an inch and a half. In these cases the theory agreed very well with the experiments. But if a bullet is placed at a greater distance from the powder, suppose at 12, 18, or 24 inches, we cannot then apply to this ball the same principles which may be applied to those laid in contact, or nearly so, with the powder; for when the surface of the fired powder is not confined by a heavy body, the flame dilates itself with a velocity far exceeding that which it can communicate to a bullet by its continued pressure: consequently, as at the distance of 12, 18, or 24 inches, the powder will have acquired a considerable degree of this velocity of expansion, the first motion of the ball will not be produced by the continued pressure of the powder, but by the actual percussion of the flame;”

Theory.

tance from
the powder.

Theory. flame; and it will therefore begin to move with a quantity of motion proportioned to the quantity of this flame, and the velocities of its respective parts.

“From hence then it follows, that the velocity of the bullet, laid at a considerable distance before the charge, ought to be greater than what would be communicated to it by the pressure of the powder acting in the manner already mentioned: and this deduction from our theory we have confirmed by manifold experience; by which we have found, that a ball laid in the barrel A, with its hinder part $11\frac{1}{4}$ inches from its breech, and impelled by 12 pennyweights of powder, has acquired a velocity of about 1400 feet in a second; when, if it had been acted on by the pressure of the flame only, it would not have acquired a velocity of 1200 feet in a second. The same we have found to hold true in all other greater distances (and also in lesser, though not in the same degree), and in all quantities of powder: and we have likewise found, that these effects nearly correspond with what has been already laid down about the velocity of expansion and the elastic and unelastic parts of the flame.

“From hence too arises another consideration of great consequence in the practice of gunnery; which is, that no bullet should at any time be placed at a considerable distance before the charge, unless the piece is extremely well fortified: for a moderate charge of powder, when it has expanded itself through the vacant space, and reaches the ball, will, by the velocity each part has acquired, accumulate itself behind the ball, and thereby be condensed prodigiously; whence, if the barrel be not extremely firm in that part, it must, by means of this re-inforced elasticity, infallibly burst. The truth of this reasoning I have experienced in an exceeding good Tower-musket, forged of very tough iron; for charging it with 12 pennyweights of powder, and placing the ball 16 inches from the breech, on firing it, the part of the barrel just behind the bullet was swelled out to double its diameter like a blown bladder, and two large pieces of two inches long were burst out of it.

“Having seen that the entire motion of a bullet laid at a considerable distance from the charge, is acquired by two different methods in which the powder acts on it; the first being the percussion of the parts of the flame with the velocity they had respectively acquired by expanding, the second the continued pressure of the flame through the remaining part of the barrel; I endeavoured to separate these different actions, and to retain that only which arose from the continued pressure of the flame. For this purpose I no longer placed the powder at the breech, from whence it would have full scope for its expansion; but I scattered it as uniformly as I could through the whole cavity left behind the bullet; imagining that by this means the progressive velocity of the flame in each part would be prevented by the expansion of the neighbouring parts: and I found, that the ball being laid $11\frac{1}{4}$ inches from the breech, its velocity, instead of 1400 feet in a second, which it acquired in the last experiments, was now no more than 1100 feet in the second, which is 100 feet short of what according to the theory should arise from the continued pressure of the powder only.

“The reason of this deficiency was, doubtless, the

intestine motion of the flame: for the accension of the powder thus distributed through so much larger a space than it could fill, must have produced many reverberations and pulsations of the flame; and from these internal agitations of the fluid, its pressure on the containing surface will (as is the case of all other fluids) be considerably diminished; and in order to avoid this irregularity, in all other experiments I took care to have the powder closely confined in as small a space as possible, even when the bullet lay at some little distance from it.

“With regard to the resistance of the air, which so remarkably affects all military projectiles, it is necessary to premise, that the greatest part of authors have established it as a certain rule, that while the same body moves in the same medium, it is always resisted in the duplicate proportion of its velocity; that is, if the resisted body move in one part of its track with three times the velocity with which it moved in some other part, then its resistance to the greater velocity will be nine times the resistance to the lesser. If the velocity in one place be four times greater than in another, the resistance of the fluid will be 16 times greater in the first than in the second, &c. This rule, however, though pretty near the truth when the velocities are confined within certain limits, is excessively erroneous when applied to military projectiles, where such resistances often occur as could scarcely be effected, on the commonly received principles, even by a treble augmentation of its density.

“By means of the machine already described, I have it in my power to determine the velocity with which a ball moves in any part of its track, provided I can direct the piece in such a manner as to cause the bullet to impinge on the pendulum placed in that part: and therefore, charging a musket-barrel three times successively with a leaden ball $\frac{1}{4}$ of an inch in diameter, and about half its weight of powder; and taking such precaution in weighing of the powder and placing it, that I was assured, by many previous trials, that the velocity of the ball could not differ by 20 feet in a second from its medium quantity; I fired it against the pendulum placed at 25, 75, and 125 feet distance from the mouth of the piece respectively; and I found that it impinged against the pendulum, in the first case, with a velocity of 1670 feet in a second; in the second case, with a velocity of 1550 feet in a second; and in the third case, with a velocity of 1425 feet in a second: so that, in passing through 50 feet of air, the bullet lost a velocity of 120 or 125 feet in a second; and the time of its passing through that space being about $\frac{1}{32}$ or $\frac{1}{30}$ of a second, the medium quantity of resistance must, in these instances, have been about 120 times the weight of the ball; which (as the ball was nearly $\frac{1}{16}$ of a pound) amounts to about 10 lb. avoirdupoise.

“Now, if a computation be made according to the method laid down for compressed fluids in the 38th proposition of Newton's *Principia*, supposing the weight of water to that of air as 850 to 1, it will be found, that the resistance to a globe of $\frac{1}{4}$ of an inch diameter, moving with a velocity of about 1600 feet in a second, will not, on these principles, amount to any more than $4\frac{1}{8}$ lb. avoirdupoise; whence, as we know that the rules contained in that proposition are

very

23
Of the resistance of the air to the motion of bullets.

Theory.

very accurate with regard to slow motions, we may hence conclude, that the resistance of the air in slow motions is less than that in swift motions, in the ratio of $4\frac{1}{8}$ to 10; a proportion between that of 1 to 2, and 1 to 3.

“ Again, I charged the same piece a number of times with equal quantities of powder, and balls of the same weight, taking all possible care to give to every shot an equal velocity; and, firing three times against the pendulum placed only 25 feet from the mouth of the piece, the medium of the velocities with which the ball impinged was nearly that of 1690 feet in a second: then removing the piece 175 feet from the pendulum, I found, taking the medium of five shots, that the velocity with which the ball impinged at this distance was 1300 feet in a second; whence the ball, in passing through 150 feet of air, lost a velocity of about 390 feet in a second; and the resistance computed from these numbers, comes out something more than in the preceding instance, it amounting here to between 11 and 12 pounds avoirdupoise; whence, according to these experiments, the resisting power of the air to swift motions is greater than to slow ones, in a ratio which approaches nearer to that of 3 to 1 than in the preceding experiments.

“ Having thus examined the resistance to a velocity of 1700 feet in a second, I next examined the resistance to smaller velocities: and for this purpose, I charged the same barrel with balls of the same diameter, but with less powder, and placing the pendulum at 25 feet distance from the piece, I fired against it five times with an equal charge each time: the medium velocity with which the ball impinged, was that of 1180 feet in a second; then, removing the pendulum to the distance of 250 feet, the medium velocity of five shots, made at this distance, was that of 950 feet in a second: whence the ball, in passing through 225 feet of air, lost a velocity of 230 feet in a second: and as it passed through that interval in about $\frac{1}{4}$ of a second, the resistance to the middle velocity will come out to be near $33\frac{1}{2}$ times the gravity of the ball, or 2 lb. 10 oz. avoirdupoise. Now, the resistance to the same velocity, according to the laws observed in slower motions, amounts to $\frac{1}{4}$ of the same quantity; whence, in a velocity of 1065 feet in a second, the resisting power of the air is augmented in no greater a proportion than that of 7 to 11; whereas we have seen in the former experiments, that to still greater degrees of velocity the augmentation approached very near the ratio of one to three.

“ But farther, I fired three shot, of the same size and weight with those already mentioned, over a large piece of water; so that their dropping into the water being very discernible, both the distance and time of their flight might be accurately ascertained. Each shot was discharged with a velocity of 400 feet in a second; and I had satisfied myself by many previous trials of the same charge with the pendulum, that I could rely on this velocity to ten feet in a second. The first shot flew 313 yards in four seconds and a quarter, the second flew 319 yards in four seconds, and the third 373 yards in five seconds and an half. According to the theory of resistance established for slow motions, the first shot ought to have spent no more than 3.2 seconds in its flight, the second 3.28, and the third 4 seconds: whence it is evident, that every shot was

retarded considerably more than it ought to have been had that theory taken place in its motion; consequently the resistance of the air is very sensibly increased, even in such a small velocity as that of 400 feet in a second.

“ As no large shot are ever projected in practice with velocities exceeding that of 1700 feet in a second, it will be sufficient for the purposes of a practical gunner to determine the resistance to all lesser velocities; which may be thus exhibited. Let AB be taken to AC, in the ratio of 1700 feet in a second to the given velocity to which the resisting power of the air is required. Continue the line AB to D, so that BD may be to AD, as the resisting power of the air to slow motions is to its resisting power to a velocity of 1700 feet in a second; then shall CD be to AD as the resisting power of the air to slow motions is to its resisting power to the given velocity represented by AC.

“ From the computations and experiments already mentioned, it plainly appears, that a leaden ball of $\frac{1}{4}$ of an inch diameter, and weighing nearly $1\frac{1}{2}$ oz. avoirdupoise, if it be fired from a barrel of 45 inches in length, with half its weight of powder, will issue from that piece with a velocity which, if it were uniformly continued, would carry it near 1700 feet in a second. — If, instead of a leaden ball, an iron one, of an equal diameter, was placed in the same situation in the same piece, and was impelled by an equal quantity of powder, the velocity of such an iron-bullet would be greater than that of the leaden one in the subduplicate ratio of the specific gravities of lead and iron; and supposing that ratio to be as three to two, and computing on the principles already laid down, it will appear, that an iron-bullet of 24 lb. weight, shot from a piece of 10 feet in length, with 16 lb. of powder, will acquire from the explosion a velocity which, if uniformly continued, would carry it nearly 1650 feet in a second.

“ This is the velocity which, according to our theory, a cannon-ball of 24 lb. weight is discharged with when it is impelled by a full charge of powder; but if, instead of a quantity of powder weighing two-thirds of the ball, we suppose the charge to be only half the weight of it, then its velocity will on the same principles be no more than 1490 feet in a second. The same would be the velocities of every lesser bullet fired with the same proportions of powder, if the lengths of all pieces were constantly in the same ratio with the diameters of their bore; and although, according to the usual dimensions of the smaller pieces of artillery, this proportion does not always hold, yet the difference is not great enough to occasion a very great variation from the velocities here assigned; as will be obvious to any one who shall make a computation thereon. But in these determinations we suppose the windage to be no more than is just sufficient for putting down the bullet easily; whereas in real service, either through negligence or unskillfulness, it often happens, that the diameter of the bore so much exceeds the diameter of the bullet, that great part of the inflamed fluid escapes by its side; whence the velocity of the shot in this case may be considerably less than what we have assigned. However, this perhaps may be compensated by the greater heat which in all probability attends the firing of these large quantities of powder.

24
Solution
of the diffi-
culty con-
cerning
point-blank
shot.

† See n^o 5.

“From this great velocity of cannon-shot we may clear up the difficulty concerning the point-blank shot which occasioned the invention of Anderson’s strange hypothesis †. Here our author was deceived by his not knowing how greatly the primitive velocity of the heaviest shot is diminished in the course of its flight by the resistance of the air. And the received opinion of practical gunners is not more difficult to account for; since, when they agree that every shot flies in a straight line to a certain distance from the piece, which imaginary distance they have called the *extent of the point-blank shot*, we need only suppose, that, within that distance which they thus determine, the deviation of the path of the shot from a straight line is not very perceptible in their method of pointing. Now, as a shot of 24 lb. fired with two-thirds of its weight of powder, will, at the distance of 500 yards from the piece, be separated from the line of its original direction by an angle of little more than half a degree; those who are acquainted with the inaccurate methods often used in the directing of cannon will easily allow, that so small an aberration may not be attended to by the generality of practitioners, and the path of the shot may consequently be deemed a straight line; especially as other causes of error will often intervene much greater than what arises from the incurvation of this line by gravity.

25

Plate
CCXXV.
fig. 3.

“We have now determined the velocity of the shot both when fired with two-thirds of its weight and with half its weight of powder respectively; and on this occasion I must remark, that on the principles of our theory, the increasing the charge of powder will increase the velocity of the shot, till the powder arrives at a certain quantity; after which, if the powder be increased, the velocity of the shot will diminish. The quantity producing the greatest velocity, and the proportion between that greatest velocity and the velocity communicated by greater and lesser charges, may be thus assigned. Let AB represent the axis of the piece; draw AC perpendicular to it, and to the asymptotes AC and AB draw any hyperbola LF, and draw BF parallel to AC; find out now the point D, where the rectangle ADEG is equal to the hyperbolic area DEFB; then will AD represent that height of the charge which communicates the greatest velocity to the shot: whence AD being to AB as 1 to 2.71828, as appears from the table of logarithms, from the length of the line AD thus determined, and the diameter of the bore, the quantity of powder contained in this charge is easily known. If, instead of this charge, any other filling the cylinder to the height AI be used, draw IH parallel to AC, and through the point H to the same asymptotes AC and AB describe the hyperbola HK; then the greatest velocity will be to the velocity communicated by the charge AI, in the subduplicate proportion of the rectangle AE to the same rectangle diminished by the trilinear space KKE.

26
Exceeding
great re-
sistance of
the air.

“It hath been already shown, that the resistance of the air on the surface of a bullet of $\frac{1}{4}$ of an inch diameter, moving with a velocity of 1670 feet in a second, amounted to about 10 lb. It hath also been shown, that an iron-bullet weighing 24 lb. if fired with 16 lb. of powder (which is usually esteemed its proper battering charge), acquires a velocity of about 1650 feet in a second, scarcely differing from the other: whence,
N^o 146.

as the surface of this last bullet is more than 54 times greater than the surface of a bullet of $\frac{1}{4}$ of an inch diameter, and their velocities are nearly the same, it follows, that the resistance on the larger bullet will amount to more than 540 lb. which is near 23 times its own weight.

“The two last propositions are principally aimed against those theorists who have generally agreed in supposing the flight of shot and shells to be nearly in the curve of a parabola. The reason given by those authors for their opinion is the supposed inconsiderable resistance of the air; since, as it is agreed on all sides that the tract of projectiles would be a perfect parabola if there was no resistance, it has from thence been too rashly concluded, that the interruption which the ponderous bodies of shells and bullets would receive from such a rare medium as air would be scarcely sensible, and consequently that their parabolic flight would be hereby scarcely affected.

“Now the prodigious resistance of the air to a bullet of 24 lb. weight, such as we have here established it, sufficiently confutes this reasoning; for how erroneous must that hypothesis be, which neglects as inconsiderable a force amounting to more than 20 times the weight of the moving body?” But here it is necessary to assume a few particulars, the demonstrations of which, on the commonly received principles, may be seen under the article PROJECTILES.

“1. If the resistance of the air be so small that the motion of a projected body is in the curve of a parabola, then the axis of that parabola will be perpendicular to the horizon, and consequently the part of the curve in which the body ascends will be equal and similar to that in which it descends.

“2. If the parabola in which the body moves be terminated on a horizontal plane, then the vertex of the parabola will be equally distant from its two extremities.

“3. Also the moving body will fall on that horizontal plane in the same angle, and with the same velocity with which it was first projected.

“4. If a body be projected in different angles but with the same velocity, then its greatest horizontal range will be when it is projected in an angle of 45° with the horizon.

“5. If the velocity with which the body is projected be known, then this greatest horizontal range may be thus found. Compute, according to the common theory of gravity, what space the projected body ought to fall through to acquire the velocity with which it is projected: then twice that space will be the greatest horizontal range, or the horizontal range when the body is projected in an angle of 45° with the horizon.

“6. The horizontal ranges of a body, when projected with the same velocity at different angles, will be between themselves as the sines of twice the angle in which the line of projection is inclined to the horizon.

“7. If a body is projected in the same angle with the horizon but with different velocities, the horizontal ranges will be in the duplicate proportion of those velocities.

“These postulates which contain the principles of the modern art of gunnery are all of them false; for

Theory.

it hath been already shown, that a musket-ball $\frac{1}{4}$ of an inch in diameter, fired with half its weight of powder, from a piece 45 inches long, moves with a velocity of near 1700 feet in a second. Now, if this ball flew in the curve of a parabola, its horizontal range at 45° would be found by the fifth postulate to be about 17 miles. But all the practical writers assure us, that this range is really short of half a mile. Diego Ufano assigns to an arquebus, four feet in length, and carrying a leaden ball of $1\frac{1}{2}$ oz. weight (which is very near our dimensions), an horizontal range of 797 common paces, when it is elevated between 40 and 50 degrees, and charged with a quantity of fine powder equal in weight to the ball. Merfennus also tells us, that he found the horizontal range of an arquebus at 45° to be less than 400 fathom, or 800 yards; whence, as either of these ranges are short of half an English mile, it follows, that a musket shot, when fired with a reasonable charge of powder at the elevation of 45° , flies not $\frac{1}{4}$ part of the distance it ought to do if it moved in a parabola. Nor is this great contraction of the horizontal range to be wondered at, when it is considered that the resistance of this bullet when it first issues from the piece amounts to 120 times its gravity, as hath been experimentally demonstrated, n^o 23.

"To prevent objections, our next instance shall be in an iron-bullet of 24 lb. weight, which is the heaviest in common use for land-service. Such a bullet fired from a piece of the common dimensions with its greatest allotment of powder hath a velocity of 1650 feet in a second, as already shown. Now, if the horizontal range of this shot, at 45° , be computed on the parabolic hypothesis by the fifth postulate, it will come out to be about 16 miles, which is between five and six times its real quantity; for the practical writers all agree in making it less than three miles.

"But farther, it is not only when projectiles move with these very great velocities that their flight sensibly varies from the curve of a parabola; the same aberration often takes place in such as move slow enough to have their motion traced out by the eye: for there are few projectiles that can be thus examined, which do not visibly disagree with the first, second, and third postulate; obviously descending thro' a curve, which is shorter and less inclined to the horizon than that in which they ascended. Also the highest point of their flight, or the vertex of the curve, is much nearer the place where they fall to the ground than to that from whence they were at first discharged.

"I have found too by experience, that the fifth, sixth, and seventh postulates are excessively erroneous when applied to the motions of bullets moving with small velocities. A leaden bullet $\frac{1}{4}$ of an inch in diameter, discharged with a velocity of about 400 feet in a second, and in an angle of $19^\circ 5'$ with the horizon, ranged on the horizontal plane no more than 448 yards: whereas its greatest horizontal range being found by the fifth postulate to be at least 1700 yards, the range at $19^\circ 5'$ ought by the sixth postulate to have been 1050 yards; whence, in this experiment, the range was not $\frac{1}{3}$ of what it must have been had the commonly received theory been true."

From this and other experiments it is clearly proved, that the track described by the flight even of

Vol. VIII. Part I.

the heaviest shot, is neither a parabola, nor approaching to a parabola, except when they are projected with very small velocities. The nature of the curve really described by them is explained under the article PROJECTILES. But as a specimen of the great complication of that subject, we shall here insert an account of a very extraordinary circumstance which frequently takes place therein.

"As gravity acts perpendicularly to the horizon, it is evident, that if no other power but gravity deflected a projected body from its course, its motion would be constantly performed in a plane perpendicular to the horizon, passing through the line of its original direction: but we have found, that the body in its motion often deviates from this plane, sometimes to the right hand and at other times to the left; and this in an incurvated line, which is convex towards that plane: so that the motion of a bullet is frequently in a line having a double curvature, it being bent towards the horizon by the force of gravity, and again bent out of its original direction to the right or left by some other force: in this case no part of the motion of the bullet is performed in the same plane, but its track will lie in the surface of a kind of cylinder, whose axis is perpendicular to the horizon.

"This proposition may be indisputably proved by the experience of every one in the least conversant with the practice of gunnery. The same piece which will carry its bullet within an inch of the intended mark at 10 yards distance, cannot be relied on to 10 inches in 100 yards, much less to 30 inches in 300 yards. Now this inequality can only arise from the track of the bullet being incurvated sideways as well as downwards: for by this means the distance between that incurvated line and the line of direction will increase in a much greater ratio than that of the distance; these lines being coincident at the mouth of the piece, and afterwards separating in the manner of a curve and its tangent, if the mouth of the piece be considered as the point of contact.—To put this matter out of all doubt, however, I took a barrel carrying a ball $\frac{1}{4}$ of an inch diameter, and fixing it on a heavy carriage, I satisfied myself of the steadiness and truth of its direction, by firing at a board $1\frac{1}{2}$ feet square, which was placed at 180 feet distance; for I found, that in 16 successive shots I missed the mark but once. Now, the same barrel being fixed on the same carriage, and fired with a smaller quantity of powder, so that the shock on the discharge would be much less, and consequently the direction less changed, I found, that at 760 yards distance the ball flew sometimes 100 yards to the right of the line it was pointed on, and sometimes as much to the left. I found, too, that its direction in the perpendicular line was not less uncertain, it falling one time above 200 yards short of what it did at another; although, by the nicest examination of the piece after the discharge, it did not appear to have started in the least from the position it was placed in.

"The reality of this doubly curvated track being thus demonstrated, it may perhaps be asked, What can be the cause of a motion so different from what has been hitherto supposed? And to this I answer, That the deflection in question must be owing to some power acting obliquely to the progressive motion of the body;

C c

29

motion of
bullets a
great source
of dissec-
tion.

Theory.

body; which power can be no other than the resistance of the air. If it be farther asked, how the resistance of the air can ever come to be oblique to the progressive motion of the body? I farther reply, that it may sometimes arise from inequalities in the resisted surface; but that its general cause is doubtless a whirling motion acquired by the bullet about its axis: for by this motion of rotation, combined with the progressive motion, each part of the bullet's surface will strike the air very differently from what it would do if there was no such whirl; and the obliquity of the action of the air arising from this cause will be greater as the motion of the bullet is greater in proportion to its progressive one.

"This whirling motion undoubtedly arises from the friction of the bullet against the sides of the piece; and as the rotatory motion will in some part of its revolution conspire with the progressive one, and in another part be equally opposed to it; the resistance of the air on the fore part of the bullet will be hereby affected, and will be increased in that part where the whirling motion conspires with the progressive one, and diminished where it is opposed to it: and by this means the whole effort of the resistance, instead of being opposite to the direction of the body, will become oblique thereto, and will produce those effects already mentioned. If it was possible to predict the position of the axis round which the bullet should whirl, and if that axis was unchangeable during the whole flight of the bullet, then the aberration of the bullet by this oblique force would be in a given direction; and the incurvation produced thereby would regularly extend the same way from one end of its track to the other. For instance, if the axis of the whirl was perpendicular to the horizon, then the incurvation would be to the right or left. If that axis was horizontal, and perpendicular to the direction of the bullet, then the incurvation would be upwards or downwards. But as the first position of this axis is uncertain, and as it may perpetually shift in the course of the bullet's flight; the deviation of the bullet is not necessarily either in one certain direction, or tending to the same side in one part of its track that it does in another, but more usually is continually changing the tendency of its deflection, as the axis round which it whirls must frequently shift its position to the progressive motion by many inevitable accidents.

"That a bullet generally acquires such a rotatory motion, as here described, is, I think, demonstrable: however, to leave no room for doubt or dispute, I confirmed it, as well as some other parts of my theory, by the following experiments.

"I caused the machine to be made represented Plate CCXXV. fig. 4. BCDE is a brass barrel, moveable on its axis, and so adjusted by means of friction-wheels, not represented in the figure, as to have no friction worth attending to. The frame in which this barrel is fixed is so placed that its axis may be perpendicular to the horizon. The axis itself is continued above the upper plate of the frame, and has fastened on it a light hollow cone, AFG. From the lower part of this cone there is extended a long arm of wood, GH, which is very thin, and cut feather-edged. At its extremity there is a contrivance for fixing on the body, whose resistance is to be investigated (as here the

globe P); and to prevent the arm GH from swaying out of its horizontal position by the weight of the annexed body P, there is a brace, AH, of fine wire, fastened to the top of the cone which supports the end of the arm.

"Round the barrel BCDE, there is wound a fine silk line, the turns of which appear in the figure; and after this line hath taken a sufficient number of turns, it is conducted nearly in a horizontal direction to the pulley L over which it is passed, and then a proper weight M is hung to its extremity. If this weight be left at liberty, it is obvious that it will descend by its own gravity, and will, by its descent, turn round the barrel BCDE, together with the arm GH, and the body P fastened to it. And whilst the resistance on the arm GH and on the body P is less than the weight M, that weight will accelerate its motion; and thereby the motion of GH and P will increase, and consequently their resistance will increase, till at last this resistance and the weight M become nearly equal to each other. The motion with which M descends, and with which P revolves, will not then sensibly differ from an equable one. Whence it is not difficult to conceive, that, by proper observations made with this machine, the resistance of the body P may be determined. The most natural method of proceeding in this investigation is as follows: Let the machine first have acquired its equable motion, which it will usually do in about five or six turns from the beginning; and then let it be observed, by counting a number of turns, what time is taken up by one revolution of the body P: then taking off the body P and the weight M, let it be examined what smaller weight will make the arm GH revolve in the same time as when P was fixed to it: this smaller weight being taken from M, the remainder is obviously equal in effort to the resistance of the revolving body P; and this remainder being reduced in the ratio of the length of the arm to the semidiameter of the barrel, will then become equal to the absolute quantity of the resistance. And as the time of one revolution is known, and consequently the velocity of the revolving body, there is hereby discovered the absolute quantity of the resistance to the given body P moving with a given degree of celerity.

"Here, to avoid all objections, I have generally chose, when the body P was removed, to fix in its stead a thin piece of lead of the same weight, placed horizontally; so that the weight which was to turn round the arm GH, without the body P, did also carry round this piece of lead. But mathematicians will easily allow that there was no necessity for this precaution.—The diameter of the barrel BCDE, and of the silk string wound round it, was 2.06 inches. The length of the arm GH, measured from the axis to the surface of the globe P, was 49.5 inches. The body P, the globe made use of, was of pasteboard; its surface very neatly coated with marbled paper. It was not much distant from the size of a 12 lb. shot, being in diameter 4.5 inches, so that the radius of the circle described by the centre of the globe was 51.75 inches. When this globe was fixed at the end of the arm, and a weight of half a pound was hung at the end of the string at M, it was examined how soon the motion of the descending weight M, and of the revolving body P, would become equable as to sense. With this view,

three

resistance.

Theory.

three revolutions being suffered to elapse, it was found that the next 10 were performed in $27\frac{3}{4}$ ", 20 in less than 55", and 30 in $82\frac{1}{2}$ "; so that the first 10 were performed in $27\frac{3}{4}$ ", the second in $27\frac{1}{4}$ ", and the third in $27\frac{1}{2}$ ".

"These experiments sufficiently evince, that even with half a pound, the smallest weight made use of, the motion of the machine was sufficiently equable after the first three revolutions.

"The globe above mentioned being now fixed at the end of the arm, there was hung on at M a weight of $3\frac{1}{4}$ lb.; and 10 revolutions being suffered to elapse, the succeeding 20 were performed in $21\frac{1}{2}$ ". Then the globe being taken off, and a thin plate of lead, equal to it in weight, placed in its room; it was found, that instead of $3\frac{1}{4}$ lb. a weight of one pound would make it revolve in less time than it did before; performing now 20 revolutions after 10 were elapsed in the space of 19".

"Hence then it follows, that from the $3\frac{1}{4}$ lb. first hung on, there is less than 1 lb. to be deducted for the resistance on the arm; and consequently the resistance on the globe itself is not less than the effort of $2\frac{1}{4}$ lb. in the situation M; and it appearing from the former measures, that the radius of the barrel is nearly $\frac{1}{30}$ of the radius of the circle, described by the centre of the globe; it follows, that the absolute resistance of the globe, when it revolves 20 times in $21\frac{1}{2}$ ", (about 25 feet in a second), is not less than the 50th part of two pounds and a quarter, or of 36 ounces; and this being considerably more than half an ounce, and the globe nearly the size of a twelve-pound shot, it irrefragably confirms a proposition I had formerly laid down from theory, that the resistance of the air to a 12 lb. iron shot, moving with a velocity of 25 feet in a second, is not less than half an ounce.

"The rest of the experiments were made in order to confirm another proposition, namely, that the resistance of the air within certain limits is nearly in the duplicate proportion of the velocity of the resisted body. To investigate this point, there were successively hung on at M, weights in the proportion of the numbers 1, 4, 9, 16; and letting 10 revolutions first elapse, the following observations were made on the rest.—With $\frac{1}{2}$ lb. the globe went 20 turns in $54\frac{1}{2}$ ", with 2 lb. it went 20 turns in $27\frac{1}{4}$ ", with $4\frac{1}{2}$ lb. it went 30 turns in $27\frac{1}{2}$ ", and with 8 lb. it went 40 turns in $27\frac{1}{2}$ ".—Hence it appears, that to resistances proportioned to the numbers 1, 4, 9, 16, there correspond velocities of the resisted body in the proportion of the numbers 1, 2, 3, 4; which proves, with great nicety, the proposition above mentioned.

"With regard to the rotatory motion, the first experiment was to evince, that the whirling motion of a ball combining with its progressive motion would produce such an oblique resistance and deflective power as already mentioned. For this purpose a wooden ball of $4\frac{1}{2}$ inches diameter was suspended by a double string, about eight or nine feet long. Now, by turning round the ball and twisting the double string, the ball when left to itself would have a revolving motion given it from the untwisting of the string again. And if, when the string was twisted, the ball was drawn to a considerable distance from the perpendicular, and there let go; it would at first, before it had acquired

Theory.

its revolving motion, vibrate steadily enough in the same vertical plane in which it first began to move: but when, by the untwisting of the string, it had acquired a sufficient degree of its whirling motion, it constantly deflected to the right or left of its first track; and sometimes proceeded so far as to have its direction at right angles to that in which it began its motion; and this deviation was not produced by the string itself, but appeared to be entirely owing to the resistance being greater on the one part of the leading surface of the globe than the other. For the deviation continued when the string was totally untwisted; and even during the time that the string, by the motion the globe had received, was twisting the contrary way. And it was always easy to predict, before the ball was let go, which way it would deflect, only by considering on which side the whirl would be combined with the progressive motion; for on that side always the deflective power acted, as the resistance was greater here than on the side where the whirl and progressive motion were opposed to one another."

Though Mr Robins considered this experiment as an incontestable proof of the truth of his theory, he undertook to give ocular demonstration of this deflection of musket-bullets even in the short space of 100 yards.

"As all projectiles," says he, "in their flight, are acted upon by the power of gravity, the deflection of a bullet from its primary direction, supposes that deflection to be upwards or downwards in a vertical plane; because, in the vertical plane, the action of gravity is compounded and entangled with the deflective force. And for this reason my experiments have been principally directed to the examination of that deflection which carries the bullet to the right or left of that plane in which it began to move. For if it appears at any time that the bullet has shifted from that vertical plane in which the motion began, this will be an incontestable proof of what we have advanced.—Now, by means of screens of exceeding thin paper, placed parallel to each other at proper distances, this deflection in question may be many ways investigated. For by firing bullets which shall traverse the screens, the flight of the bullet may be traced; and it may easily appear whether they do or do not keep invariably to one vertical plane. This examination may proceed on three different principles, which I shall here separately explain.

"For first, an exactly vertical plane may be traced out upon all these screens, by which the deviation of any single bullet may be more readily investigated, only by measuring the horizontal distance of its trace from the vertical plane thus delineated; and by this means the absolute quantity of its aberration may be known. Or if the description of such a vertical plane should be esteemed a matter of difficulty and nicety, a second method may be followed; which is that of resting the piece in some fixed notch or socket, so that though the piece may have some little play to the right and left, yet all the lines in which the bullet can be directed shall intersect each other in the centre of that fixed socket: by this means, if two different shot are fired from the piece thus situated, the horizontal distances made by the two bullets on any two screens ought to be in the same proportion to each other as the

Theory. the respective distances of the screens from the socket in which the piece was laid. And if these horizontal distances differ from that proportion, then it is certain that one of the shot at least hath deviated from a vertical plane, although the absolute quantity of that deviation cannot hence be assigned; because it cannot be known what part of it is to be imputed to one bullet, and what to the other.

"But if the constant and invariable position of the notch or socket in which the piece was placed, be thought too hard an hypothesis in this very nice affair; the third method, and which is the simplest of all, requires no more than that two shot be fired through three screens without any regard to the position of the piece each time: for in this case, if the shots diverge from each other, and both keep to a vertical plane, then if the horizontal distances of their traces on the first screen be taken from the like horizontal distances on the second and third, the two remainders will be in the same proportion with the distances of the second and third screen from the first. And if they are not in this proportion, then it will be certain that one of them at least hath been deflected from the vertical plane; though here, as in the last case, the quantity of that deflection in each will not be known.

31
Remark-
able devia-
tions of
bullets to
the right
and left.

"All these three methods I have myself made use of at different times, and have ever found the success agreeable to my expectation. But the most eligible method seemed to be a compound of the two last. The apparatus was as follows.—Two screens were set up in the larger walk in the charter-house garden; the first of them at 250 feet distance from the wall, which was to serve for a third screen; and the second 200 feet from the same wall. At 50 feet before the first screen, or at 300 feet from the wall, there was placed a large block weighing about 200 lb. weight, and having fixed into it an iron bar with a socket at its extremity, in which the piece was to be laid. The piece itself was of a common length, and bored for an ounce ball. It was each time loaded with a ball of 17 to the pound, so that the windage was extremely small, and with a quarter of an ounce of good powder. The screens were made of the thinnest issue paper; and the resistance they gave to the bullet (and consequently their probability of deflecting it) was so small, that a bullet lighting one time near the extremity of one of the screens, left a fine thin fragment of it towards the edge entire, which was so very weak that it was difficult to handle it without breaking. These things thus prepared, five shot were made with the piece rested in the notch above mentioned; and the horizontal distances between the first shot, which was taken as a standard, and the four succeeding ones, both on the first and second screen and on the wall, measured in inches, were as follows:

	1st Screen.	2d Screen.	Wall.
1 to 2	1,75 R.	3,15 R.	16,7 R.
3	10 L.	15,6 L.	69,25 L.
4	1,25 L.	4,5 L.	15,0 L.
5	2,15 L.	5,1 L.	19,0 L.

"Here the letters R and L denote that the shot in question went either to the right or left of the first.

"If the position of the socket in which the piece was placed be supposed fixed, then the horizontal distances measured above on the first and second screen,

Theory. and on the wall, ought to be in proportion to the distances of the first screen, the second screen, and the wall from the socket. But by only looking over these numbers, it appears, that none of them are in that proportion; the horizontal distance of the first and third, for instance, on the wall being above nine inches more than it should be by this analogy.

"If, without supposing the invariable position of the socket, we examine the comparative horizontal distances according to the third method described above, we shall in this case discover divarications still more extraordinary; for, by the numbers set down, it appears, that the horizontal distances of the second and third shot on the two screens, and on the wall, are as under.

1st Screen.	2d Screen.	Wall.
11.75	18.75	83.95

Here, if, according to the rule given above, the distance on the first screen be taken from the distances on the other two, the remainder will be 7, and 74.2: and these numbers, if each shot kept to a vertical plane, ought to be in the proportion of 1 to 5; that being the proportion of the distances of the second screen, and of the wall from the first: but the last number 74.2 exceeds what it ought to be by this analogy by 39.2; so that between them there is a deviation from the vertical plane of above 39 inches, and this too in a transit of little more than 80 yards.

"But farther, to show that these irregularities do not depend on any accidental circumstance of the balls fitting or not fitting the piece, there were five shots more made with the same quantity of powder as before; but with smaller bullets, which ran much looser in the piece. And the horizontal distances being measured in inches from the trace of the first bullet to each of the succeeding ones, the numbers were as under.

	1st Screen.	2d Screen.	Wall.
1 to 2	15.6 R.	31.1 R.	94.0 R.
3	6.4 L.	12.75 L.	23.0 L.
4	4.7 R.	8.5 R.	15.5 R.
5	12.6 R.	24.0 R.	63.5 R.

Here, again, on the supposed fixed position of the piece, the horizontal distance on the wall between the first and third will be found above 15 inches less than it should be if each kept to a vertical plane; and like irregularities, though smaller, occur in every other experiment. And if they are examined according to the third method set down above, and the horizontal distances of the third and fourth, for instance, are compared, those on the first and second screen, and on the wall, appear to be thus.

1st Screen.	2d Screen.	Wall.
11.1	21.25	38.5

And if the horizontal distance on the first screen be taken from the other two, the remainders will be 10.15, and 27.4; where the least of them, instead of being five times the first, as it ought to be, is 23.35 short of it; so that here is a deviation of 23 inches.

"From all these experiments, the deflection in question seems to be incontestably evinced. But to give some farther light to this subject, I took a barrel of the same bore with that hitherto used; and bent it at about three or four inches from its muzzle to the left, the bend making an angle of three or four degrees with

Theory.

with the axis of the piece. This piece thus bent was fired with a loose ball, and the same quantity of powder hitherto used, the screens of the last experiment being still continued. It was natural to expect, that if this piece was pointed by the general direction of its axis, the ball would be canted to the left of that direction by the bend near its mouth. But as the bullet, in passing through that bent part, would, as I conceived, be forced to roll upon the right-hand side of the barrel, and thereby its left side would turn up against the air, and would increase the resistance on that side; I predicted to the company then present, that if the axis on which the bullet whirled, did not shift its position after it was separated from the piece; then, notwithstanding the bent of the piece to the left, the bullet itself might be expected to incurvate towards the right; and this, upon trial, did most remarkably happen. For one of the bullets fired from this bent piece passed through the first screen about $1\frac{1}{2}$ inch distant from the trace of one of the shot fired from the straight piece in the last set of experiments. On the second screen, the traces of the same bullets were about three inches distant; the bullet from the crooked piece passing on both screens to the left of the other: but comparing the places of these bullets on the wall, it appeared that the bullet from the crooked piece, though it diverged from the track on the two screens, had now crossed that track, and was deflected considerably to the right of it; so that it was obvious, that though the bullet from the crooked piece might first be canted to the left, and had diverged from the track of the other bullet with which it was compared, yet by degrees it deviated again to the right, and a little beyond the second screen crossed that track from which it before diverged, and on the wall was deflected 14 inches, as I remember, on the contrary side. And this experiment is not only the most convincing proof of the reality of this deflection here contended for; but is likewise the strongest confirmation that it is brought about in the very manner and by the very circumstances which we have all along described.

"I have now only to add, that as I suspected the consideration of the revolving motion of the bullet, compounded with its progressive one, might be considered as a subject of mathematical speculation, and that the reality of any deflecting force thence arising might perhaps be denied by some computists upon the principles hitherto received of the action of fluids; I thought proper to annex a few experiments, with a view of evincing the strange deficiency of all theories of this sort hitherto established, and the unexpected and wonderful varieties which occur in these matters: The proposition which I advanced for this purpose being, That two equal surfaces meeting the air with the same degree of obliquity, may be so differently resisted, that though in one of them the resistance is less than that of a perpendicular surface meeting the same quantity of air, yet in another it shall be considerably greater.

"To make out this proposition, I made use of the machine already described: and having prepared a pasteboard pyramid, whose base was four inches square, and whose planes made angles of 45° with the plane of its base; and also a parallelogram four inches in

breadth, and $5\frac{1}{2}$ in length, which was equal to the surface of the pyramid, the globe P was taken off from the machine, and the pyramid was first fixed on; and 2 lb. being hung at M, and the pyramid so fitted as to move with its vertex forwards, it performed 20 revolutions after the first ten were elapsed in $33''$. Then the pyramid being turned, so that its base, which was a plane of four inches square, went foremost, it now performed 20 revolutions with the same weight in $38\frac{1}{4}''$.—After this, taking off the pyramid, and fixing on the parallelogram with its longer side perpendicular to the arm, and placing its surface in an angle of 45° with the horizon by a quadrant, the parallelogram, with the same weight, performed 20 revolutions in $43\frac{1}{2}''$.

"Now here this parallelogram and the surface of the pyramid are equal to each other, and each of them met the air in an angle of 45° ; and yet one of them made 20 revolutions in $33''$, whilst the other took up $43\frac{1}{2}''$. And at the same time it appears, that a flat surface, such as a base of a pyramid, which meets the same quantity of air perpendicularly, makes 20 revolutions in $38\frac{1}{4}''$, which is the medium between the other two.

"But to give another and still more simple proof of this principle; there was taken a parallelogram four inches broad and $8\frac{1}{4}$ long. This being fixed at the end of the arm, with its long side perpendicular thereto, and being placed in an angle of 45° with the horizon, there was a weight hung on at M of $3\frac{1}{2}$ lb. with which the parallelogram made 20 revolutions in $40\frac{1}{2}''$. But after this, the position of the parallelogram was shifted, and it was placed with its shorter side perpendicular to the arm, though its surface was still inclined to an angle of 45° with the horizon; and now, instead of going slower, as might be expected from the greater extent of part of its surface from the axis of the machine, it went round much faster: for in this last situation it made 20 revolutions in $35\frac{1}{4}''$, so that there were 5'' difference in the time of 20 revolutions; and this from no other change of circumstance than as the larger or shorter side of the oblique plane was perpendicular to the line of its direction."

In the 73d volume of the Philosophical Transactions, several experiments on this subject, but upon a larger scale, are related by Lovell Edgeworth, Esq. They confirm the truth of what Mr Robins advances, but nothing is said to explain the reason of it.

These are the principal experiments made by Mr Robins in confirmation of his theory, and which not only far exceed every thing that had been formerly done, but even bid fair for advancing the art of gunnery to its *ne plus ultra*. It must be observed, however, that in this art it is impossible we should ever arrive at absolute perfection; that is, it can never be expected that a gunner, by any method of calculation whatever, could be enabled to point his guns in such a manner, that the shot would hit the mark if placed any where within its range. Aberrations, which can by no means be either foreseen or prevented, will take place from a great number of different causes. A variation in the density of the atmosphere, in the dampness of the powder, or in the figure of the shot, will cause variations in the range of the bullet, which cannot by any means be reduced to rules, and consequently must

Theory.

32
Strange anomaly in the resistance of the air.

33
Why the art of gunnery cannot become perfect.

Theory.

must render the event of each shot very precarious. The resistance of the atmosphere simply considered, without any of those anomalies arising from its density at different times, is a problem which, notwithstanding the labours of Mr Robins and others, hath not been completely solved: and, indeed, if we consider the matter in a physical light, we shall find, that without some other data than those which are yet obtained, an exact solution of it is impossible.

34
The air
acts as a
moving
power as
well as a
resisting
one.

It is an objection that hath been made to the mathematical philosophy, and to which in many cases it is most certainly liable, that it considers the *resistance* of matter more than its capacity of giving motion to other matter. Hence, if in any case matter acts both as a resisting and a moving power, and the mathematician overlooks its effort towards motion, founding his demonstrations only upon its property of resisting, these demonstrations will certainly be false, tho' they should be supported by all the powers of geometry. It is to an error of this kind that we are to attribute the great differences already taken notice of between the calculations of Sir Isaac Newton, with regard to the resisting force of fluids, and what actually takes place upon trial. These calculations were made upon the supposition that the fluid through which a body moved could do nothing else but resist it; yet it is certain, that the air (the fluid with which we have to do at present) proves a source of *motion*, as well as resistance, to all bodies which move in it.

Plate
CCXXV.
fig. 5.

To understand this matter fully, let ABC represent a crooked tube made of any solid matter, and *a, b*, two pistons which exactly fill the cavity. If the space between these pistons is full of air, it is plain they cannot come into contact with each other on account of the elasticity of the included air, but will remain at some certain distance as represented in the figure. If the piston *b* is drawn up, the air which presses in the direction *Cb* acts as a resisting power, and the piston will not be drawn up with such ease as if the whole was in *vacuo*. But though the column of air pressing in the direction *Cb* acts as a resisting power on the piston *b*, the column pressing in the direction *Aa* will act as a moving power upon the piston *a*. It is therefore plain, that if *b* is moved upwards till it comes to the place marked *d*, the other will descend to that marked *c*. Now, if we suppose the piston *a* to be removed, it is plain, that when *b* is pulled upwards to *d*, the air descending through the leg *AaCB* will press on the under side of the piston *b*, as strongly as it would have done upon the upper side of the piston *a*, had it been present. Therefore, though the air passing down through the leg *CB* resists the motion of the piston *b* when drawn upwards, the air pressing down through the leg *AB* forwards it as much; and accordingly the piston *b* may be drawn up or pushed down at pleasure, and with very little trouble. But if the orifice at *A* is stopped, so that the air can only exert its resisting power on the piston *b*, it will require a considerable degree of strength to move the piston from *b* to *d*.

If now we suppose the tube to be entirely removed (which indeed answers no other purpose than to render the action of the air more evident), it is plain, that if the piston is moved either up or down, or in any other direction we can imagine, the air presses as much upon the back part of it as it resists it on the fore part; and

of consequence, a ball moving through the air with any degree of velocity, ought to be as much accelerated by the action of the air behind, as it is retarded by the action of that before.—Here then it is natural to ask, If the air accelerates a moving body as much as it retards it, how comes it to make any resistance at all? yet certain it is, that this fluid doth resist, and that very considerably. To this it may be answered, that the air is always kept in some certain state or constitution by another power which rules all its motions, and it is this power undoubtedly which gives the resistance. It is not to our purpose at present to inquire what that power is; but we see that the air is often in very different states: one day, for instance, its parts are violently agitated by a storm; and another, perhaps, they are comparatively at rest in a calm. In the first case, nobody hesitates to own, that the storm is occasioned by some cause or other, which violently resists any other power that would prevent the agitation of the air. In a calm, the case is the same; for it would require the same exertion of power to excite a tempest in a calm day, as to allay a tempest in a stormy one. Now it is evident, that all projectiles, by their motion, agitate the atmosphere in an unnatural manner; and consequently are resisted by that power, whatever it is, which tends to restore the equilibrium, or bring back the atmosphere to its former state.

If no other power besides that above mentioned acted upon projectiles, it is probable, that all resistance to their motion would be in the duplicate proportion of their velocities; and accordingly, as long as the velocity is small, we find it generally is so. But when the velocity comes to be exceedingly great, other sources of resistance arise. One of these is a subtraction of part of the moving power; which though not properly a *resistance*, or opposing another power to it, is an equivalent thereto. This subtraction arises from the following cause. The air, as we have already observed, presses upon the hinder part of the moving body by its gravity, as much as it resists the forepart of it by the same property. Nevertheless, the velocity with which the air presses upon any body by means of its gravity, is limited; and it is possible that a body may change its place with so great velocity that the air hath not time to rush in upon the back part of it, in order to assist its progressive motion. When this happens to be the case, there is in the first place a deficiency of the moving power equivalent to 15 pounds on every square inch of surface; at the same time that there is a positive resistance of as much more on the forepart, owing to the gravity of the atmosphere, which must be overcome before the body can move forward.

This deficiency of moving power, and increase of resistance, do not only take place when the body moves with a very great degree of velocity, but in all motions whatever. It is not in all cases perceptible, because the velocity with which the body moves, frequently bears but a very small proportion to the velocity with which the air presses in behind it. Thus, supposing the velocity with which the air rushes into a vacuum to be 1200 feet in a second, if a body moves with a velocity of 30, 40, or 50 feet in a second, the force with which the air presses on the back part is but $\frac{1}{4}$ at the utmost less than that which resists on the forepart of it, which

Theory.

Theory.

which will not be perceptible: but if, as in the case of bullets, the velocity of the projectile comes to have a considerable proportion to the velocity wherewith the air rushes in behind it; then a very perceptible and otherwise unaccountable resistance is observed, as we have seen in the experiments already related by Mr Robins. Thus, if the air presses in with a velocity of 1200 feet in a second, if the body changes its place with a velocity of 600 feet in the same time, there is a resistance of 15 pounds on the fore part, and a pressure of only $7\frac{1}{2}$ on the back part. The resistance therefore not only overcomes the moving power of the air by $7\frac{1}{2}$ pounds, but there is a deficiency of other $7\frac{1}{2}$ pounds owing to the want of half the pressure of the atmosphere on the back part, and thus the whole loss of the moving power is equivalent to 15 pounds; and hence the exceeding great increase of resistance observed by Mr Robins beyond what it ought to be according to the common computations.—The velocity with which the air rushes into a vacuum is therefore a desideratum in gunnery. Mr Robins supposes that it is the same with the velocity of sound; and that when a bullet moves with a velocity greater than that of 1200 feet in a second, it leaves a perfect vacuum behind it. Hence he accounts for the great increase of resistance to bullets moving with such velocities; but as he doth not take notice of the loss of the air's moving power, the anomalies of all lesser velocities are inexplicable on his principles. Nay, he even tells us, that Sir Isaac Newton's rule for computing resistances may be applied in all velocities less than 1100 or 1200 feet in a second, though this is expressly contradicted by his own experiments mentioned n^o 23.

35
It resists by
its elasticity
as well as
gravity.

Though for these reasons it is evident how great difficulties must occur in attempting to calculate the resistance of the air to military projectiles, we have not even yet discovered all the sources of resistance to these bodies when moving with immense velocities. Another power by which they are opposed (and which at last becomes greater than any of those hitherto mentioned), is the air's elasticity. This, however, will not begin to show itself in the way of resistance till the velocity of the moving body becomes considerably greater than that by which the air presses into a vacuum. Having therefore first ascertained this velocity, which we shall suppose to be 1200 feet in a second, it is plain, that if a body moves with a velocity of 1800 feet in a second, it must compress the air before it; because the fluid hath neither time to expand itself in order to fill the vacuum left behind the moving body, nor to rush in by its gravity. This compression it will resist by its elastic power, which thus becomes a new source of resistance, increasing, without any limit, in proportion to the velocity of the moving body. If now we suppose the moving body to set out with a velocity of 2400 feet in a second, it is plain, that there is not only a vacuum left behind the body, but the air before it is compressed into half its natural space. The loss of motion in the projectile therefore is now very considerable. It first loses 15 pounds on every square inch of surface on account of the deficiency of the moving power of the air behind it; then it loses 15 pounds more on account of the resistance of the air before it; again it loses 15 pounds on account of the elasticity of the compressed air; and lastly another 15 pounds on ac-

Theory.

count of the vacuum behind, which takes off the weight of the atmosphere, that would have been equivalent to one half of the elasticity of the air before it. The whole resistance therefore upon every square inch of surface moving with this velocity is 60 pounds, besides that which arises from the power tending to preserve the general state of the atmosphere, and which increases in the duplicate proportion of the velocity as already mentioned. If the body is supposed to move with a velocity of 4800 feet in a second, the resistance from the air's elasticity will then be quadrupled, or amount to 60 pounds on the square inch of surface; which added to the other causes, produces a resistance of 105 pounds upon the square inch; and thus would the resistance from the elasticity of the air go on continually increasing, till at last the motion of the projectile would be as effectually stopped as if it was fired against a wall. This obstacle therefore we are to consider as really insuperable by any art whatever, and therefore it is not advisable to use larger charges of powder than what will project the shot with a velocity of 1200 feet in a second. To this velocity the elasticity of the air will not make great resistance, if indeed it do make any at all: for though Mr Robins hath conjectured that air rushes into a vacuum with the velocity of sound, or between 11 and 1200 feet in a second; yet we have no decisive proof of the truth of this supposition. At this velocity indeed, according to Mr Robins, a very sudden increase of resistance takes place: but this is denied by Mr Glenie*, who supposes that the resistance proceeds gradually; and indeed it seems to be pretty obvious, that the resistance cannot very suddenly increase, if the velocity is only increased in a small degree. Yet it is certain, that the swiftest motions with which cannon-balls can be projected are very soon reduced to this standard; for Mr Robins acquaints us, that "a 24-pound shot, when discharged with a velocity of 2000 feet in a second, will be reduced to that of 1200 feet in a second in a flight of little more than 500 yards."

* Hist. of
Gunnery,
P. 48, 50.

In the 71st volume of the Philosophical Transactions, Mr Thomson has proposed a new method of determining the velocities of bullets, by measuring the force of the recoil of the piece. As in all cases action and re-action are supposed to be equal to one another, it appears that the momentum of a gun, or the force of its recoil backwards, must always be equivalent to the force of its charge: that is, the velocity with which the gun recoils, multiplied into its weight, is equal to the velocity of the bullet multiplied into its weight; for every particle of matter, whether solid or fluid, that issues out of the mouth of a piece, must be impelled by the action of some power, which power must re-act with equal force against the bottom of the bore.—Even the fine invisible elastic fluid that is generated from the powder in its inflammation, cannot put itself in motion without re-acting against the gun at the same time. Thus we see pieces, when they are fired with powder alone, recoil as well as when their charges are made to impel a weight of shot, though the recoil is not in the same degree in both cases. It is easy to determine the velocity of the recoil in any given case, by suspending the gun in an horizontal position by two pendulous rods, and measuring the arc of its ascent by means of a ribbon, as mentioned under the

Theory.

the article GUNPOWDER; and this will give the momentum of the gun, its weight being known, and consequently the momentum of its charge. But in order to determine the velocity of the bullet from the momentum of the recoil, it will be necessary to know how much the weight and velocity of the elastic fluid contributes to it.

“That part of the recoil which arises from the expansion of the fluid is always very nearly the same whether the powder is fired alone, or whether the charge is made to impel one or more bullets, as has been determined by a great variety of experiments.—If therefore a gun, suspended according to the method prescribed, is fired with any given charge of powder, but without any bullet or wad, and the recoil is observed, and if the same piece is afterwards fired with the same quantity of powder, and a bullet of a known weight, the excess of the velocity of the recoil in the latter case, over that in the former, will be proportional to the velocity of the bullet; for the difference of these velocities, multiplied into the weight of the gun, will be equal to the weight of the bullet multiplied into its velocity.—Thus, if W is put equal to the weight of the gun, U = the velocity of the bullet when fired with a given charge of powder without any bullet; V = the velocity of the recoil, when the same charge is made to impel a bullet; B = the weight of the bullet, and v = its velocity; it will be $v = \frac{V-U+W}{B}$.”

To determine how far this theory agreed with practice, an experiment was made with a charge of 165 grains of powder without any bullet, which produced a recoil of 5.5 inches; and in another, with a bullet, the recoil was 5.6 inches; the mean of which is 5.55 inches; answering to a velocity of 1.1358 feet in a second. In five experiments with the same charge of powder, and a bullet weighing 580 grains, the mean was 14.6 inches; and the velocity of the recoil answering to the length just mentioned, is 2.9880 feet in a second: consequently $V-U$, or $2.9880 - 1.1358$, is equal to 1.8522 feet in a second. But as the velocities of recoil are known to be as the chords of the arcs through which the barrel ascends, it is not necessary, in order to determine the velocity of the bullet, to compute the velocities V and U ; but the quantity $V-U$, or the difference of the velocities of the recoil when the given charge is fired with and without a bullet, may be computed from the value of the difference of the chords by one operation.—Thus the velocity answering to the chord 9.05, is that of 1.8522 feet in a second, is just equal to $V-U$, as was before found.

In this experiment the weight of the barrel with its carriage was just $47\frac{1}{4}$ pounds, to which $\frac{3}{4}$ of a pound were to be added on account of the weight of the rods by which it was suspended; which makes $W=48$ pounds, or 336,000 grains. The weight of the bullet was 580 grains; whence B is to W as 580 to 336,000; that is, as 1 to 579.31 very nearly. The value of $V-U$, answering to the experiments before mentioned, was found to be 1.8522; consequently the velocity of the bullets = v , was $1.8522 + 579.31 = 1073$ feet, which differs only by 10 from 1083, the velocities found by the pendulum.

The velocities of the bullets may be found from the
N^o 146.

Theory.

recoil by a still more simple method; for the velocities of the recoil being as the chords measured upon the ribbon, if c is put equal to the chord of the recoil expressed in English inches, when the piece is fired with powder only, and C = the chord when the same piece is charged with a bullet: then $C-c$ will be as $V-U$;

and consequently as $\frac{V-U+W}{B}$ which measures the velocity of the bullet, the ratio of W to B remaining the same.—If therefore we suppose a case in which $C-c$ is equal to one inch, and the velocity of the bullet is computed from that chord, the velocity in any other case, wherein $C-c$ is greater or less than one inch, will be found by multiplying the difference of the chords C and c by the velocity that answers to the difference of one inch.—The length of the parallel rods, by which the piece was suspended being 64 inches, the velocity of the recoil, $=C-c=1$ inch measured upon the ribbon, is 0.204655 parts of a foot in one second; which in this case is also the value of $V-U$: the velocity of the bullet, or v , is therefore $0.204655 + 579.31 = 118.35$ feet in a second. Hence the velocity of the bullet may in all cases be found by multiplying the difference of the chords C and c by 118.35; the weight of the barrel, the length of the rods by which it is suspended, and the weight of the bullet remaining the same; and this whatever the charge of powder made use of may be, and however it may differ in strength and goodness.

The exactness of this second method will appear from the following experiments. On firing the piece with 145 grains of powder and a bullet, the mean of three sets of experiments was 13.25, 13.15, and 13.2; and with the same charge of powder without a bullet, the recoil was 4.5, 4.3, or 4.4: $C-c$ therefore was $13.2 - 4.4 = 8.8$ inches; and the velocity of the bullets $= 8.8 + 118.35 = 1045$ feet in a second; the velocities by the pendulum coming out 10.40 feet in the same space of time.

In the far greatest number of experiments to determine the comparative accuracy of the two methods, a surprising agreement was found betwixt the last mentioned one and that by the pendulum; but in some few the differences were very remarkable. Thus, in two where the recoil was 12.92, and 13.28 the velocity, by computation from the chords is 1030 feet per second; but in computing by the pendulum it amounted only to 900; but in these some inaccuracy was suspected in the experiment with the pendulum, and that the computation from the recoil was most to be depended upon. In another experiment, the velocity by the recoil exceeded that by the pendulum by no less than 346 feet; the former showing 2109, and the latter only 1763 feet in a second. In two others the pendulum was also deficient, though not in such a degree. In all these it is remarkable, that where the difference was considerable, it was still in favour of the recoil. The deficiency in these experiments appears to have been somewhat embarrassing to our author. “It cannot be supposed, says he, that it arose from any imperfection in Mr Robins’s method of determining the velocities of bullets; for that method is founded upon such principles as leave no room to doubt of its accuracy; and the practical errors that occur in making the experiments, and which cannot be entirely prevented, or exactly

Theory. exactly compensated, are in general so small, that the difference in the velocities cannot be attributed to them. It is true, the effect of those errors is more likely to appear in experiments made under such circumstances as the present; for the bullet being very light (A), the arc of the ascent of the pendulum was but small; and a small mistake in measuring the chord upon the ribbon would have produced a very considerable error in computing the velocity of the bullet: Thus a difference of one-tenth of an inch, more or less, upon the ribbon, in that experiment where the difference was greatest, would have made a difference in the velocity of more than 120 feet in a second. But, independent of the pains that were taken to prevent mistakes, the striking agreement of the velocities in so many other experiments, affords abundant reason to conclude, that the errors arising from those causes were in no case very considerable.—But if both methods of determining the velocities of bullets are to be relied on, then the difference of the velocities, as determined by them in these experiments, can only be accounted for by supposing that it arose from their having been diminished by the resistance of the air in the passage of the bullets from the mouth of the piece to the pendulum: and this suspicion will be much strengthened, when we consider how great the resistance of the air is to bodies that move very swiftly in it; and that the bullets in these experiments were not only projected with great velocities, but were also very light, and consequently more liable to be retarded by the resistance on that account.

“To put the matter beyond all doubt, let us see what the resistance was that these bullets met with, and how much their velocities were diminished by it. The weight of the bullet in the most erroneous experiment was 90 grains; its diameter 0.78 of an inch; and it was projected with a velocity of 2109 feet in a second. If now a computation be made according to the law laid down by Sir Isaac Newton for compressed fluids, it will be found, that the resistance to this bullet was not less than $8\frac{1}{2}$ pounds avoirdupoise, which is something more than 660 times its own weight. But Mr Robins has shown by experiment, that the resistance of the air to bodies moving in it with very great velocity, is near three times greater than Sir Isaac has determined it; and as the velocity with which this bullet was impelled is considerably greater than any in Mr Robins's experiments, it is highly probable, that the resistance in this instance was at least 2000 times greater than the weight of the bullet.

“The distance from the mouth of the piece to the pendulum was 12 feet; but, as there is reason to think that the blast of the powder, which always follows the bullet, continues to act upon it for some sensible space of time after it is out of the bore, and, by urging it on, counterbalances, or at least counteracts in a great measure, the resistance of the air, we will suppose that the resistance does not begin, or rather that the motion of the bullet does not begin to be retarded, till it has got to the distance of two feet from the muzzle. The distance, therefore, between the barrel and the pendulum, instead of 12 feet, is to be estimated at 10

VOL. VIII. Part I.

feet; and as the bullet took up about $\frac{1}{10}$ part of a second in running over that space, it must in that time have lost a velocity of about 335 feet in a second, as will appear upon making the computation; and this will very exactly account for the apparent diminution of the velocity in the experiment: for the difference of the velocities, as determined by the recoil and the pendulum $= 2109 - 1763 = 346$ feet in a second, is extremely near 335 feet in a second, the diminution of the velocity by the resistance as here determined.

“If the diminution of the velocities of the bullets in the two subsequent experiments be computed in like manner, it will turn out in one 65, and in the other 33, feet in a second: and, making these corrections, the comparison of the two methods of ascertaining the velocities will stand thus:

Velocities by the pendulum,	1763	1317	1136
Resistance of air to be added,	335	65	33
	2098	1382	1169
Velocity by the recoil,	2109	1430	1288

Difference after correction, +11 +48 +119

“It appears therefore, that notwithstanding these corrections, the velocities as determined by the pendulum, particularly in the last, were considerably deficient. But the manifest irregularity of the velocities, in those instances, affords abundant reason to conclude, that it must have arisen from some accidental cause, and therefore that little dependence is to be put upon the result of those experiments. I cannot take upon me to determine positively what the cause was which produced this irregularity, but I strongly suspect that it arose from the breaking of the bullets in the barrel by the force of the explosion: for these bullets, as has already been mentioned, were formed of lead, inclosing lesser bullets of plaster of Paris; and I well remember to have observed at the time several small fragments of the plaster which had fallen down by the side of the pendulum. I confess I did not then pay much attention to this circumstance, as I naturally concluded that it arose from the breaking of the bullet in penetrating the target of the pendulum; and that the small pieces of plaster I saw upon the ground, had fallen out of the hole by which the bullet entered. But if the bullets were not absolutely broken in pieces in firing, yet if they were considerably bruised, and the plaster, or a part of it, were separated from the lead, such a change in the form might produce a great increase in the resistance, and even their initial velocities might be affected by it; for their form being changed from that of a globe to some other figure, they might not fit the bore; and a part of the force of the charge might be lost by the windage.—That this actually happened in the experiment last-mentioned, seems very probable; as the velocity with which the bullet was projected, as it was determined by the recoil, was considerably less in proportion in that experiment than in many others which preceded and followed it in the same set.

“As allowance has been made for the resistance of the air in these cases, it may be expected that the same

D d

should

(A) They were made of lead inclosing a nucleus of Paris plaster.

Theory.

should be done in all other cases: but it will probably appear, upon inquiry, that the diminution of the velocities of the bullets, on that account, was so inconsiderable, that it might safely be neglected: thus, for instance, in the experiments with an ounce of powder, when the velocity of the bullet was more than 1750 feet in a second, the diminution turns out no more than 25 or 30 feet in a second, though we suppose the full resistance to have begun so near as two feet from the mouth of the piece; and in all cases where the velocity was less, the effect of the resistance was less in a much greater proportion: and even in this instance, there is reason to think, that the diminution of the velocity, as we have determined it, is too great; for the flame of gunpowder expands with such amazing rapidity, that it is scarcely to be supposed but that it follows the bullet, and continues to act upon it more than two feet, or even four feet, from the gun; and when the velocity of the bullet is less, its action upon it must be sensible at a still greater distance."

As this method of determining the velocities of bullets by the recoil of the piece did not occur to Mr Thomson till after he had finished his experiments with a pendulum, and taken down his apparatus, he had it not in his power to determine the comparative strength of the recoil without and with a bullet; and consequently the velocity with which the flame issues from the mouth of a piece. He is of opinion, however, that every thing relative to these matters may be determined with greater accuracy by the new method than by any other formerly practised; and he very justly remarks, that the method of determining the velocity by the recoil, gives it originally as the bullet sets out; while that by the pendulum shows it only after a part has been destroyed by the resistance of the air. In the course of his remarks, he criticises upon a part of Mr Robins's theory, that when bullets of the same diameter, but different weights, are discharged from the same piece by the same quantity of powder, their velocities are in a sub-duplicate ratio of their weight. This theory, he observes, is manifestly defective, as being founded upon a supposition, that the action of the elastic fluid, generated from the powder, is always the same in any and every given part of the bore when the charge is the same, whatever may be the weight of the bullet; and as no allowance is made for the expenditure of force required to put the fluid itself in motion, nor for the loss of it by the vent. "It is true (says he) Dr Hutton in his experiments found this law to obtain without any great error; and possibly it may hold good with sufficient accuracy in many cases; for it sometimes happens, that a number of errors or actions, whose operations have a contrary tendency, so compensate each other, that their effects when united are not sensible. But when this is the case, if any one of the causes of error is removed, those which remain will be detected.—When any given charge is loaded with a heavy bullet, more of the powder is inflamed in any very short space of time than when the bullet is lighter, and the action of the powder ought upon that account to be greater; but a heavy bullet takes up longer time in passing through the bore than a light one; and consequently more of the elastic fluid generated from the powder escapes by the vent and by windage.

Practice.

It may happen that the augmentation of the force, on account of one of these circumstances, may be just able to counterbalance the diminution of it arising from the other; and if it should be found upon trial, that this is the case in general, in pieces as they are now constructed, and with all the variety of shot that are made use of in practice, it would be of great use to know the fact: but when, with Mr Robins, concluding too hastily from the result of a partial experiment, we suppose, that because the sum total of the pressure of the elastic fluid upon the bullet, during the time of its passage through the bore, happens to be the same when bullets of different weights are made use of, that therefore it is always so, our reasonings may prove very inconclusive, and lead to very dangerous errors."

In the prosecution of his subject Mr Thomson proves mathematically, as well as by actual experiment, that the theory laid down by Mr Robins in this respect is erroneous. The excels is in favour of heavy bullets, which acquire a velocity greater than they ought to do according to Mr Robins's rule; and so considerable are the errors, that in one of Mr Thomson's experiments, the difference was no less than 2042 feet in a second. When the weight of the bullet was increased four times, the action of the powder was found to be nearly doubled; for in one experiment, when four bullets were discharged at once, the collective pressure was as 4; but when only a single bullet was made use of, it was no more than 0.5825; and on the whole he concludes, that the velocity of bullets is in the reciprocal sub-triplicate ratio of their weights. Our author observes also, that Mr Robins is not only mistaken in the particular just mentioned, but in his conclusions with regard to the absolute force of gunpowder compared with the pressure of the atmosphere; the latter being to the force of gunpowder as 1 to 1000 according to Mr Robins; but as 1 to 1308 according to Mr Thomson.

SECT. III. *Practice of Gunnery.*

WITH regard to the practical part of gunnery, which ought to consist in directing the piece in such a manner as always to hit the object against which it is pointed, there can be no certain rules given. The following maxims are laid down by Mr Robins as of use in practice.

1. In any piece of artillery whatever, the greater the quantity of powder it is charged with, the greater will be the velocity of the bullet.
2. If two pieces of the same bore, but of different lengths, are fired with the same charge of powder, the longer will impel the bullet with a greater celerity than the shorter.
3. If two pieces of artillery different in weight, and formed of different metals, have yet their cylinders of equal bores and equal lengths; then with like charges of powder and like bullets they will each of them discharge their shot with nearly the same degree of celerity.
4. The ranges of pieces at a given elevation are no just measures of the velocity of the shot; for the same piece fired successively at an invariable elevation, with the powder, bullet, and every other circumstance as

nearly

Practice. nearly the same as possible, will yet range to very different distances.

5. The greatest part of that uncertainty in the ranges of pieces which is described in the preceding maxim, can only arise from the resistance of the air.

6. The resistance of the air acts upon projectiles in a twofold manner: for it opposes their motion, and by that means continually diminishes their celerity; and it besides diverts them from the regular track they would otherwise follow; whence arise those deviations and inflections already treated of.

7. That action of the air by which it retards the motion of projectiles, though much neglected by writers on artillery, is yet, in many instances, of an immense force; and hence the motion of these resisted bodies is totally different from what it would otherwise be.

8. This retarding force of the air acts with different degrees of violence, according as the projectile moves with a greater or lesser velocity; and the resistances observe this law, That to a velocity which is double another, the resistance within certain limits is fourfold; to a treble velocity, ninefold; and so on.

9. But this proportion between the resistances to two different velocities, does not hold if one of the velocities be less than that of 1200 feet in a second, and the other greater. For in that case the resistance to the greater velocity is near three times as much as it would come out by a comparison with the smaller, according to the law explained in the last maxim.

10. To the extraordinary power exerted by the resistance of the air it is owing, that when two pieces of different bores are discharged at the same elevation, the piece of the largest bore usually ranges farthest, provided they are both fired with fit bullets, and the customary allotment of powder.

11. The greatest part of military projectiles will at the time of their discharge acquire a whirling motion round their axis by rubbing against the inside of their respective pieces; and this whirling motion will cause them to strike the air very differently from what they would do had they no other than a progressive motion. By this means it will happen, that the resistance of the air will not always be directly opposed to their flight; but will frequently act in a line oblique to their course, and will thereby force them to deviate from the regular track they would otherwise describe. And this is the true cause of the irregularities described in maxim 4.

12. From the sudden trebling the quantity of the air's resistance, when the projectile moves swifter than at the rate of 1200 feet in a second (as hath been explained in maxim 9), it follows, that whatever be the regular range of a bullet discharged with this last mentioned velocity, that range will be but little increased how much soever the velocity of the bullet may be still farther augmented by greater charges of powder.

13. If the same piece of cannon be successively fired at an invariable elevation, but with various charges of powder, the greatest charge being the whole weight of the bullet in powder, and the least not less than the fifth part of that weight; then if the elevation be not less than eight or ten degrees, it will be found, that some of the ranges with the least charge will exceed some of those with the greatest.

14. If two pieces of cannon of the same bore, but of different lengths, are successively fired at the same elevation with the same charge of powder; then it will frequently happen, that some of the ranges with the shorter piece will exceed some of those with the longer.

15. In distant cannonadings, the advantages arising from long pieces and large charges of powder are but of little moment.

16. In firing against troops with grape-shot, it will be found, that charges of powder much less than those generally used are the most advantageous.

17. The principal operations in which large charges of powder appear to be more efficacious than small ones, are the ruining of parapets, the dismounting of batteries covered by stout merlons, or battering in breach; for, in all these cases, if the object be but little removed from the piece, every increase of velocity will increase the penetration of the bullet.

18. Whatever operations are to be performed by artillery, the least charges of powder with which they can be effected are always to be preferred.

19. Hence, then, the proper charge of any piece of artillery is not that allotment of powder which will communicate the greatest velocity to the bullet (as most practitioners formerly maintained); nor is it to be determined by an invariable proportion of its weight to the weight of the ball: but, on the contrary, it is such a quantity of powder as will produce the least velocity for the purpose in hand; and, instead of bearing always a fixed ratio to the weight of the ball, it must be different according to the different business which is to be performed.

20. No field-piece ought at any time to be loaded with more than $\frac{1}{2}$, or at the utmost $\frac{2}{3}$, of the weight of its bullet in powder; nor should the charge of any battering piece exceed $\frac{1}{3}$ of the weight of its bullet.

21. Although precepts very different from those we have here given have been often advanced by artilleryists, and have been said to be derived from experience; yet is that pretended experience altogether fallacious: since from our doctrine of resistance established above, it follows, that every speculation on the subject of artillery, which is only founded on the experimental ranges of bullets discharged with considerable velocities, is liable to great uncertainty.

The greatest irregularities in the motion of bullets are, as we have seen, owing to the whirling motion on their axis, acquired by the friction against the sides of the piece. The best method hitherto known of preventing these is by the use of pieces with *rifled barrels*. These pieces have the insides of their cylinders cut with a number of spiral channels: so that it is in reality a female screw, varying from the common screws only in this, that its threads or rifles are less deflected, and approach more to a right line; it being usual for the threads with which the rifled barrel is indented, to take little more than one turn in its whole length. The numbers of these threads are different in each barrel, according to the size of the piece and the fancy of the workman; and in like manner the depth to which they are cut is not regulated by any invariable rule.

The usual method of charging these pieces is this: When the proper quantity of powder is put down, a

Practice. leaden bullet is taken, a small matter larger than the bore of the piece was before the rifles were cut: and this bullet being laid on the mouth of the piece, and consequently too large to go down of itself, it is forced by a strong rammer impelled by a mallet, and by repeated blows is driven home to the powder; and the softness of the lead giving way to the violence with which the bullet is impelled, that zone of the bullet which is contiguous to the piece varies its arcular form, and takes the shape of the inside of the barrel; so that it becomes part of a male screw exactly answering to the indents of the rifle.

In some parts of Germany and Switzerland, however, an improvement is added to this practice; especially in the larger pieces which are used for shooting at great distances. This is done by cutting a piece of very thin leather, or of thin fustian, in a circular shape, somewhat larger than the bore of the barrel. This circle being greased on one side, is laid upon the muzzle with its greasy side downwards; and the bullet being then placed upon it, is forced down the barrel with it: by which means the leather or fustian incloses the lower half of the bullet, and, by its interposition between the bullet and the rifles, prevents the lead from being cut by them. But it must be remembered, that in the barrels where this is practised, the rifles are generally shallow, and the bullet ought not to be too large.—But as both these methods of charging at the mouth take up a good deal of time; the rifled barrels which have been made in Britain, are contrived to be charged at the breech, where the piece is for this purpose made larger than in any other part. The powder and bullet are put in through the side of the barrel by an opening, which, when the piece is loaded, is then filled up with a screw. By this means, when the piece is fired, the bullet is forced through the rifles, and acquires the spiral motion already described; and perhaps somewhat of this kind, says Mr Robins, though not in the manner now practised, would be of all others the most perfect method for the construction of these kinds of barrels.

From the whirling motion communicated by the rifles, it happens, that when the piece is fired, that indented zone of the bullet follows the sweep of the rifles; and thereby, besides its progressive motion, acquires a circular motion round the axis of the piece; which circular motion will be continued to the bullet after its separation from the piece; and thus a bullet discharged from a rifled barrel is constantly made to whirl round an axis which is coincident with the line of its flight. By this whirling on its axis, the aberration of the bullet which proves so prejudicial to all operations in gunnery, is almost totally prevented. The reason of this may be easily understood from considering the slow motion of an arrow through the air. For example, if a bent arrow, with its wings not placed in some degree in a spiral position, so as to make it revolve round its axis as it flies through the air, were shot at a mark with a true direction, it would constantly deviate from it, in consequence of being pressed to one side by the convex part opposing the air obliquely. Let us now suppose this deflection in a flight of 100 yards to be equal to 10 yards. Now, if the same bent arrow were made to revolve round its axis once every two yards of its flight, its greatest de-

Practice. viation would take place when it had proceeded only one yard, or made half a revolution; since at the end of the next half revolution it would again return to the same direction it had at first; the convex side of the arrow having been once in opposite positions. In this manner it would proceed during the whole course of its flight, constantly returning to the true path at the end of every two yards; and when it reached the mark, the greatest deflection to either side that could happen would be equal to what it makes in proceeding one yard, equal to $\frac{1}{10}$ th part of the former, or 3.6 inches, a very small deflection when compared with the former one. In the same manner, a cannon-ball which turns not round its axis, deviates greatly from the true path, on account of the inequalities on its surface; which, although small, cause great deviations by reason of the resistance of the air, at the same time that the ball acquires a motion round its axis in some uncertain direction occasioned by the friction against its sides. But by the motion acquired from the rifles, the error is perpetually corrected in the manner just now described; and accordingly such pieces are much more to be depended on, and will do execution at a much greater distance, than the other.

The reasons commonly alleged for the superiority of rifle-barrels over common ones, are, either that the inflammation of the powder is greater, by the resistance which the bullet makes by being thus forced into the barrel, and that hereby it receives a much greater impulse; or that the bullet by the compounding of its circular and revolving motions, did as it were bore the air, and thereby flew to a much greater distance than it would otherwise have done; or that by the same boring motion it made its way through all solid substances, and penetrated into them much deeper than when fired in the common manner. But Mr Robins hath proved these reasons to be altogether erroneous, by a great number of experiments made with rifle-barrelled pieces. "In these experiments," says he, "I have found that the velocity of the bullet fired from a rifled barrel was usually less than that of the bullet fired from a common piece with the same proportion of powder. Indeed it is but reasonable to expect that this should be the case; for if the rifles are very deep, and the bullet is large enough to fill them up, the friction bears a very considerable proportion to the effort of the powder. And that in this case the friction is of consequence enough to have its effects observed; I have discovered by the continued use of the same barrel. For the metal of the barrel being soft, and wearing away apace, its bore by half a year's use was considerably enlarged, and consequently the depth of its rifles diminished; and then I found that the same quantity of powder would give to the bullet a velocity near a tenth part greater than what it had done at first. And as the velocity of the bullet is not increased by the use of rifled barrels, so neither is the distance to which it flies, nor the depth of its penetration into solid substances. Indeed these two last suppositions seem at first sight too chimerical to deserve a formal confutation. But I cannot help observing that those who have been habituated to the use of rifled pieces are very excusable in giving way to these prepossessions. For they constantly found, that with

Practice

with them they could fire at a mark with tolerable success, though it were placed at three or four times the distance to which the ordinary pieces were supposed to reach. And therefore, as they were ignorant of the true cause of this variety, and did not know that it arose only from preventing the deflection of the ball; it was not unnatural for them to imagine that the superiority of effect in the rifled piece was owing either to a more violent impulse at first, or to a more easy passage through the air.

"In order to confirm the foregoing theory of rifle-barrelled pieces, I made some experiments by which it might be seen whether one side of the ball discharged from them uniformly keeps foremost during the whole course. To examine this particular, I took a rifled barrel carrying a bullet of six to the pound; but instead of its leaden bullet I used a wooden one of the same size, made of a soft springy wood, which bent itself easily into the rifles without breaking. And firing the piece thus loaded against a wall at such a distance as the bullet might not be shivered by the blow, I always found, that the same surface which lay foremost in the piece continued foremost without any sensible deflection during the time of its flight. And this was easily to be observed, by examining the bullet; as both the marks of the rifles, and the part that impinged on the wall, were sufficiently apparent. Now, as these wooden bullets were but the 16th part of the weight of the leaden ones; I conclude, that if there had been any unequal resistance or deflective power, its effects must have been extremely sensible upon this light body, and consequently in some of the trials I made the surface which came foremost from the piece must have been turned round into another situation.

"But again, I took the same piece, and, loading it now with a leaden ball, I set it nearly upright, sloping it only three or four degrees from the perpendicular in the direction of the wind; and firing it in this situation, the bullet generally continued about half a minute in the air, it rising by computation to near three quarters of a mile perpendicular height. In these trials I found that the bullet commonly came to the ground to the leeward of the piece, and at such a distance from it, as nearly corresponded to the angle of its inclination, and to the effort of the wind; it usually falling not nearer to the piece than 100, nor farther from it than 150, yards. And this is a strong confirmation of the almost steady flight of this bullet for about a mile and a half: for were the same trial made with a common piece, I doubt not but the deviation would often amount to half a mile, or perhaps considerably more; though this experiment would be a very difficult one to examine, on account of the little chance there would be of discovering where the ball fell.

"It must be observed, however, that though the bullet impelled from a rifle-barrelled piece keeps for a time to its regular track with sufficient nicety; yet if its flight be so far extended that the track becomes considerably incurvated, it will then undergo considerable deflections. This, according to my experiments, arises from the angle at last made by the axis on which the bullet turns, and the direction in which it flies: for that axis continuing nearly parallel to itself, it must necessarily diverge from the line of

the flight of the bullet, when that line is bent from its original direction; and when it once happens that the bullet whirls on an axis which no longer coincides with the line of its flight, then the unequal resistance formerly described will take place, and the deflecting power hence arising will perpetually increase as the track of the bullet, by having its range extended, becomes more and more incurvated.—This matter I have experienced in a small rifle-barrelled piece, carrying a leaden ball of near half an ounce weight. For this piece, charged with one drachm of powder, ranged about 550 yards at an angle of 12 degrees with sufficient regularity; but being afterwards elevated to an angle of 24 degrees, it then ranged very irregularly, generally deviating from the line of its direction to the left, and in one case not less than 100 yards. This apparently arose from the cause above mentioned, as was confirmed from the constant deviation of the bullet to the left; for by considering how the revolving motion was continued with the progressive one, it appeared that a deviation that way was to be expected.

"The best remedy I can think of for this defect is the making use of bullets of an egg-like form instead of spherical ones. For if such a bullet hath its shorter axis made to fit the piece, and it be placed in the barrel with its smaller end downwards, then it will acquire by the rifles a rotation round its larger axis; and its centre of gravity lying nearer to its fore than its hinder part, its longer axis will be constantly forced by the resistance of the air into the line of its flight; as we see, that by the same means arrows constantly lie in the line of their direction, however that line be incurvated.

"But, besides this, there is another circumstance in the use of these pieces, which renders the flight of their bullets uncertain when fired at a considerable elevation. For I find by my experiments, that the velocity of a bullet fired with the same quantity of powder from a rifled barrel, varies much more from itself in different trials than when fired from a common piece.—This, as I conceive, is owing to the great quantity of friction, and the impossibility of rendering it equal in each experiment. Indeed, if the rifles are not deeply cut, and if the bullet is nicely fitted to the piece, so as not to require a great force to drive it down, and if leather or fustian well greased is made use of between the bullet and barrel, perhaps, by a careful attention to all these particulars, great part of the inequality in the velocity of the bullet may be prevented, and the difficulty in question be in some measure obviated: but, till this be done, it cannot be doubted, that the range of the same piece, at an elevation, will vary considerably in every trial; although the charge be each time the same. And this I have myself experienced, in a number of diversified trials, with a rifle-barrelled piece loaded at the breech in the English manner. For here the rifles being indented very deep, and the bullet so large as to fill them up completely, I found, that though it flew with sufficient exactness to the distance of 400 or 500 yards; yet when it was raised to an angle of about 12 degrees (at which angle, being fired with one-fifth of its weight in powder, its medium range is nearly 1000 yards); in this case, I say, I found that its range was variable, although the greatest care was taken to prevent any inequalities

Practice. inequalities in the quantity of powder, or in the manner of charging. And as, in this case, the angle was too small for the first-mentioned irregularity to produce the observed effects; they can only be imputed to the different velocities which the bullet each time received by the unequal action of the friction."

Thus we see, that it is in a manner impossible entirely to correct the aberrations arising from the resistance of the atmosphere; as even the rifle-barrelled pieces cannot be depended upon for more than one-half of their actual range at any considerable elevation. It becomes therefore a problem very difficult of solution to know, even within a very considerable distance, how far a piece will carry its ball with any probability of hitting its mark, or doing any execution. The best rules hitherto laid down on this subject are those of Mr Robins. The foundation of all his calculations is the velocity with which the bullet flies off from the mouth of the piece. Mr Robins himself had not opportunities of making many experiments on the velocities of cannon-balls, and the calculations from smaller ones cannot always be depended upon. In the 68th volume of the Phil. Trans. Mr Hutton hath recited a number of experiments made on cannon carrying balls from one to three pounds weight. His machine for discovering the velocities of these balls was the same with that of Mr Robins, only of a larger size. His charges of powder were two, four, and eight ounces; and the results of 15 experiments which seem to have been the most accurate, are as follow.

Velocity with two ounces.	Velocity with four ounces.	Velocity with eight ounces.
702 feet in 1"	1068 feet in 1"	1419 feet in 1"
682	1020	1352
695	948	1443
703	973	1360
725	957	1412
<u>5)3507</u>	<u>5)4966</u>	<u>5)6986</u>
Mean velocities 701	993	1397

In another course, the mean velocities, with the same charges of powder, were 613, 873, 1162. "The mean velocities of the balls in the first course of experiments (says Mr Hutton) with two, four, and eight ounces of powder, are as the numbers 1, 1.414, and 1.993; but the subduplicate ratio of the weights (two, four, and eight) give the numbers 1, 1.414, and 2, to which the others are sufficiently near. It is obvious, however, that the greatest difference lies in the last number, which answers to the greatest velocity. It will still be a little more in defect if we make the allowance for the weights of the balls; for the mean weights of the balls with the two and four ounces is $18\frac{1}{2}$ ounces, but of the eight ounces it is $18\frac{1}{2}$: diminishing therefore the number 1.993 in the reciprocal subduplicate ratio of $18\frac{1}{2}$ to $18\frac{1}{2}$, it becomes 1.985, which falls short of the number 2 by .015, or the 133d part of itself. A similar defect was observed in the other course of experiments; and both are owing to three evident causes, viz. 1. The less length of cylinder through which the ball was impelled; for with the eight-ounce charge it lay three or four inches nearer to the muzzle of the piece than with the others. 2. The greater quantity of elastic fluid which escaped in this case than in the others by the windage. This happens from its moving

with a greater velocity; in consequence of which, a greater quantity escapes by the vent and windage than in smaller velocities. 3. The greater quantity of powder blown out unfired in this case than in that of the lesser velocities; for the ball which was impelled with the greater velocity, would be sooner out of the piece than the others, and the more so as it had a less length of the bore to move through; and if powder fire in time, which cannot be denied, though indeed that time is manifestly very short, a greater quantity of it must remain unfired when the ball with the greater velocity issues from the piece, than when that which has the less velocity goes out, and still the more so as the bulk of powder which was at first to be inflamed in the one case so much exceeded that in the others.

"Let us now compare the corresponding velocities in both cases. In the one they are 701, 993, 1397; in the other, 613, 873, 1162. Now the ratio of the first two numbers, or the velocities with two ounces of powder, is that of 1 to 1.436, the ratio of the next two is that of 1 to 1.1375, and the ratio of the last is that of 1 to 1.2022. But the mean weight of the shot for two and four ounces of powder, was $28\frac{1}{2}$ ounces in the first course and $18\frac{1}{2}$ in this; and for eight ounces of powder, it was $28\frac{1}{2}$ in the first and $18\frac{1}{2}$ in this. Taking therefore the reciprocal subduplicate ratios of these weights of shot, we obtain the ratio of 1 to 1.224 for that of the balls which were fired with two ounces and four ounces of powder, and the ratio of 1 to 1.241 for the balls which were fired with eight ounces. But the real ratios above found are not greatly different from these; and the variation of the actual velocities from this law of the weights of shot, inclines the same way in both courses of experiments. We may now collect into one view the principal inferences that have resulted from these experiments.

1. "It is evident from them, that powder fires almost instantaneously.

2. "The velocities communicated to balls or shot of the same weight with different quantities of powder, are nearly in the subduplicate ratio of these quantities; a very small variation in defect taking place when the quantities of powder become great.

3. "When shot of different weights are fired with the same quantity of powder, the velocities communicated to them are nearly in the reciprocal subduplicate ratio of their weights.

4. "Shot which are of different weights, and impelled by different quantities of powder, acquire velocities which are directly as the square roots of the quantities of powder, and inversely as the square roots of the weights of the shot nearly."

The velocities of the bullets being thus found as nearly as possible, the ranges may be found by the following rules laid down by Mr Robins.

1. "Till the velocity of the projectile surpasses that of 1100 feet in a second, the resistance may be reckoned to be in the duplicate proportion of the velocity, and its mean quantity may be reckoned about half an ounce avoirdupoise on a 12-pound shot, moving with a velocity of about 25 or 26 feet in a second.

2. "If the velocity be greater than that of 1100 or 1200 feet in a second, then the absolute quantity of the resistance in these greater velocities will be near three times as great as it should be by a comparison with

38
Mr Hutton's experiments on the velocity of cannon balls.

39
Mr Robins's method of finding the ranges of bullets.

Practice. with the smaller velocities.—Hence then it appears, that if a projectile begins to move with a velocity less than that of 1100 feet in 1", its whole motion may be supposed to be considered on the hypothesis of a resistance in the duplicate ratio of the velocity. And if it begins to move with a velocity greater than this last mentioned, yet if the first part of its motion, till its velocity be reduced to near 1100 feet in 1", be considered separately from the remaining part in which the velocity is less than 1100 feet in 1"; it is evident, that both parts may be truly assigned on the same hypothesis; only the absolute quantity of the resistance is three times greater in the first part than in the last. Wherefore, if the motion of a projectile on the hypothesis of a resistance in the duplicate ratio of the velocity be truly and generally assigned, the actual motions of resisted bodies may be thereby determined, notwithstanding the increased resistances in the great velocities. And, to avoid the division of the motion into two, I shall show how to compute the whole at one operation with little more trouble than if no such increased resistance took place.

"To avoid frequent circumlocutions, the distance to which any projectile would range in a vacuum on the horizontal plain at 45° of elevation, I shall call the potential random of that projectile; the distance to which the projectile would range *in vacuo* on the horizontal plane at any angle different from 45°, I shall call the potential range of the projectile at that angle; and the distance to which a projectile really ranges, I shall call its actual range.

"If the velocity with which a projectile begins to move is known, its potential random and its potential range at any given angle are easily determined from the common theory of projectiles*; or more generally, if either its original velocity, its potential random, or its potential range, at a given angle, are known, the other two are easily found out.

"To facilitate the computation of resisted bodies, it is necessary, in the consideration of each resisted body, to assign a certain quantity, which I shall denominate F, adapted to the resistance of that particular projectile. To find this quantity F to any projectile given, we may proceed thus: First find, from the principles already delivered, with what velocity the projectile must move, so that its resistance may be equal to its gravity. Then the height from whence a body must descend in a vacuum to acquire this velocity is the magnitude of F sought. But the concise way of finding this quantity F to any shell or bullet is this: If it be of solid iron, multiply its diameter measured in inches by 300, the product will be the magnitude of F expressed in yards. If, instead of a solid iron-bullet, it is a shell or a bullet of some other substance; then, as the specific gravity of iron is to the specific gravity of the shell or bullet given, so is the F corresponding to an iron-bullet of the same diameter to the proper F for the shell or bullet given. The quantity F being thus assigned, the necessary computations of these resisted motions may be dispatched by the three following propositions, always remembering that these propositions proceed on the hypothesis of the resistance being in the duplicate proportion of the velocity of the resisted body. How to apply this principle, when the velocity is so great as to have its resistance augmented beyond this rate,

shall be shown in a corollary to be annexed to the first proposition. Practice.

"PROP. I. Given the actual range of a given shell or bullet at any small angle not exceeding 8° or 10°, to determine its potential range, and consequently its potential random and original velocity.

"SOL. Let the actual range given be divided by the F corresponding to the given projectile, and find the quote in the first column of the preceding Table; then the corresponding number in the second column multiplied into F will be the potential range sought: and thence, by the methods already explained, the potential random and the original velocity of the projectile is given.

"EXAM. An 18 pounder, the diameter of whose shot is about 5 inches, when loaded with 2 lb. of powder, ranged at an elevation of 3° 30' to the distance of 975 yards.

"The F corresponding to this bullet is 1500 yards, and the quote of the actual range by this number is .65; corresponding to which, in the second column, is .817; whence 817 F, or 1225 yards, is the potential range sought; and this, augmented in the ratio of the sine of twice the angle of elevation to the radius, gives

* See Proposition.

Practice.

gives 10050 yards for the potential random: whence it will be found, that the velocity of this projectile was that of 984 feet in a second.

"COR. 1st. If the converse of this proposition be desired; that is, if the potential range in a small angle be given, and thence the actual range be sought; this may be solved with the same facility by the same table: for if the given potential range be divided by its correspondent F, then opposite to the quote sought in the second column, there will be found in the first column a number which multiplied into F will give the actual range required. And from hence it follows, that if the actual range be given at one angle, it may be found at every other angle not exceeding 8° or 10° .

"COR. 2d. If the actual range at a given small angle be given, and another actual range be given, to which the angle is sought; this will be determined by finding the potential ranges corresponding to the two given actual ranges; then the angle corresponding to one of these potential ranges being known, the angle corresponding to the other will be found by the common theory of projectiles.

"COR. 3d. If the potential random deduced from the actual range by this proposition exceeds 13000 yards; then the original velocity of the projectile was so great as to be affected by the treble resistance described above; and consequently the real potential random will be greater than what is here determined. However, in this case, the true potential random may be thus nearly assigned. Take a 4th continued proportional to 13000 yards, and the potential random found by this proposition, and the 4th proportional thus found may be assumed for the true potential random sought. In like manner, when the true potential random is given greater than 13000 yards, we must take two mean proportionals between 13000 and this random*: and the first of these mean proportionals must be assumed instead of the random given, in every operation described in these propositions and their corollaries. And this method will nearly allow for the increased resistance in large velocities, the difference only amounting to a few minutes in the angle of direction of the projected body, which, provided that angle exceeds two or three degrees, is usually scarce worth attending to.

"Of this process take the following example.

"A 24 pounder fired with 12 pounds of powder, when elevated at $7^\circ 15'$, ranged about 2500 yards. Here the F being near 1700 yards, the quote to be sought in the first column is 147, to which the number corresponding in the second column is 2.556; whence the potential range is near 4350 yards, and the potential random thence resulting 17400. But this being more than 13000, we must, to get the true potential random, take a 4th continued proportional to 13000 and 17400; and this 4th proportional, which is about 31000 yards, is to be esteemed the true potential random sought; whence the velocity is nearly that of 1730 feet in a second.

"SCHOLIUM. This proposition is confined to small angles, not exceeding 8° or 10° . In all possible cases of practice, this approximation, thus limited, will not differ from the most rigorous solution by so much as what will often intervene from the variation of the density of the atmosphere in a few hours time; so that the errors of the approximation are much short of

N^o 146.

other inevitable errors, which arise from the nature of this subject.

"PROP. II. Given the actual range of a given shell or bullet, at any angle not exceeding 45° , to determine its potential range at the same angle; and thence its potential random and original velocity.

"SOL. Diminish the F corresponding to the shell or bullet given in the proportion of the radius to the cosine of $\frac{1}{4}$ of the angle of elevation. Then, by means of the preceding table, operate with this reduced F in the same manner as is prescribed in the solution of the last proposition, and the result will be the potential range sought; whence the potential random, and the original velocity, are easily determined.

"EXAM. A mortar for sea-service, charged with 30 lb. of powder, has sometimes thrown its shell, of $12\frac{1}{4}$ inches diameter, and of 231 lb. weight, to the distance of 2 miles, or 5450 yards. This at an elevation of 45° .

"The F to this shell, if it were solid, is 3825 yards; but as the shell is only $\frac{1}{4}$ of a solid globe, the true F is no more than 3060 yards. This, diminished in the ratio of the radius to the cosine of $\frac{1}{4}$ of the angle of elevation, becomes 2544. The quote of the potential range by this diminished F is 1,384; which sought in the first column of the preceding table gives 2.280 for the corresponding number in the second column; and this multiplied into the reduced F, produces 5800 yards for the potential range sought, which, as the angle of elevation was 45° , is also the potential random: and hence the original velocity of this shell appears to be that of about 748 feet in a second.

"COR. The converse of this proposition, that is, the determination of the actual range from the potential range given, is easily deduced from hence by means of the quote of the potential range divided by the reduced F; for this quote searched out in the second column will give a corresponding number in the first column, which multiplied into the reduced F, will be the actual range sought.

"Also, if the potential random of a projectile be given, or its actual range at a given angle of elevation; its actual range at any other angle of elevation, not greater than 45° , may hence be known. For the potential random will assign the potential range at any given angle; and thence, by the method of this corollary, the actual range may be found.

"EXAM. A fit musquet-bullet fired from a piece of the standard dimensions, with $\frac{1}{4}$ of its weight in good powder, acquires a velocity of near 900 feet in a second; that is, it has a potential random of near 8400 yards. If now the actual range of this bullet at 15° was sought, we must proceed thus:

"From the given potential random it follows, that the potential range at 15° is 4200 yards; the diameter of the bullet is $\frac{1}{4}$ of an inch; and thence, as it is of lead, its proper F is 337.5 yards, which, reduced in the ratio of the radius to the cosine of $\frac{1}{4}$ of 15° , becomes 331 yards. The quote of 4200 by this number is 12.7 nearly; which, being sought in the second column, gives 3.2 nearly for the corresponding number in the first column; and this multiplied into 331 yards (the reduced F) makes 1059 yards for the actual range sought.

"EXAM. II. The same bullet, fired with its whole weight in powder, acquires a velocity of about 2100 feet

* The operations directed in this corollary are best performed by the table of logarithms.

Practice. feet in a second, to which there corresponds a potential random of about 45700 yards. But this number greatly exceeding 13000 yards, it must be reduced by the method described in the third corollary of the first proposition, when it becomes 19700 yards. If now the actual range of this bullet at 15° was required, we shall from hence find, that the potential range at 15° is 9850 yards; which, divided by the reduced F of the last example, gives for a quote 2975: and thence following the steps prescribed above, the actual range of this bullet comes out 1396 yards, exceeding the former range by no more than 337 yards; whereas the difference between the two potential ranges is above ten miles. Of such prodigious efficacy is the resistance of the air, which hath been hitherto treated as too insignificant a power to be attended to in laying down the theory of projectiles!

“SCHOL. I must here observe, that as the density of the atmosphere perpetually varies, increasing and diminishing often by $\frac{1}{10}$ part, and sometimes more, in a few hours; for that reason I have not been over rigorous in forming these rules, but have considered them as sufficiently exact when the errors of the approximation do not exceed the inequalities which would take place by a change of $\frac{1}{10}$ part in the density of the atmosphere. With this restriction, the rules of this proposition may be safely applied in all possible cases of practice. That is to say, they will exhibit the true motions of all kinds of shells and cannon-shot, as far as 45° of elevation, and of all musket bullets fired with their largest customary charges, if not elevated more than 30° . Indeed, if experiments are made with extraordinary quantities of powder, producing potential randoms greatly surpassing the usual rate; then in large angles some farther modifications may be necessary. And though, as these cases are beyond the limits of all practice, it may be thought unnecessary to consider them; yet, to enable those who are so disposed to examine these uncommon cases, I shall here insert a proposition, which will determine the actual motion of a projectile at 45° , how enormous soever its original velocity may be. But as this proposition will rather relate to speculative than practical cases, instead of supposing the actual range known, thence to assign the potential random, I shall now suppose the potential random given, and the actual range to be thence investigated.

“PROP. III. Given the potential random of a given shell or bullet, to determine its actual range at 45° .

SOL. Divide the given potential random by the F corresponding to the shell or bullet given, and call the quotient q, and let l be the difference between the tabular logarithms of 25 and of q, the logarithm of 10 being supposed unity; then the actual range sought is $3.4 F + 2lF - \frac{11}{10}F$, where the double sine of $2lF$ is to be thus understood; that if q be less than 25, it must be $-2lF$; if it be greater, then it must be $+2lF$. In this solution, q may be any number not less than 3, nor more than 2500.

“COR. Computing in the manner here laid down, we shall find the relation between the potential randoms, and the actual range at 45° , within the limits of this proposition, to be as expressed in the following table.

VOL. VIII. Part I.

Potential Random.	Actual Range at 45° .
3 F	1,5 F
6 F	2,1 F
10 F	2,6 F
20 F	3,2 F
30 F	3,6 F
40 F	3,8 F
50 F	4,0 F
100 F	4,6 F
200 F	5,1 F
500 F	5,8 F
1000 F	6,4 F
2500 F	7,0 F

Whence it appears, that, when the potential random is increased from 3F to 2500F, the actual range is only increased from $1\frac{1}{2}$ F to 7 F; so that an increase of 2497F in the potential random produces no greater an increase in the actual range than $5\frac{1}{2}$ F, which is not its $\frac{1}{400}$ part; and this will again be greatly diminished on account of the increased resistance, which takes place in great velocities. So extraordinary are the effects of this resistance, which we have been hitherto taught to regard as inconsiderable.

“That the justness of the approximations laid down in the 2d and 3d propositions may be easier examined; I shall conclude these computations by inserting a table of the actual ranges at 45° of a projectile, which is refitted in the duplicate proportion of its velocity. This table is computed by methods different from those hitherto described, and is sufficiently exact to serve as a standard with which the result of our other rules may be compared. And since whatever errors occur in the application of the preceding propositions, they will be most sensible at 45° of elevation, it follows, that hereby the utmost limits of those errors may be assigned.

Potential Randoms.	Actual Range at 45° .
,1 F	,0963 F

40
Of the different parts and proportions of guns.

We have now only to consider that part of practical gunnery which relates to the proportions of the different parts of cannon, the metal of which they are made, &c.

Formerly the guns were made of a very great length, and were on that account extremely troublesome and unmanageable. The error here was first discovered by accident; for some cannon, having been cast by mistake two feet and an half shorter than the common standard, were found to be equally efficacious in service with the common ones, and much more manageable. This soon produced very considerable alterations in the form of the artillery throughout Europe; but in no country have greater improvements in this respect been made than in our own. For a long time brass, or rather a kind of bell-metal, was thought preferable to cast iron for making of cannon. The composition of this metal is generally kept a secret by each particular founder.

41
Composition for brass guns

The author of the Military Dictionary gives the following proportions as the most common, viz. "To 240 lb. of metal fit for casting they put 68 lb. of copper, 52 lb. of brass, and 12 lb. of tin. To 4200 lb. of metal fit for casting the Germans put 3687 $\frac{1}{4}$ lb. of copper, 2044 $\frac{1}{2}$ lb. of brass, and 307 $\frac{1}{4}$ lb. of tin. Others use 100 lb. of copper, 6 lb. of brass, and 9 lb. of tin; while some make use of 100 lb. of copper, 10 lb. of brass, and 15 lb. of tin. This composition was both found to be very expensive, and also liable to great inconveniences in the using. A few years ago, therefore, a proposal was made by Mr Muller for using iron guns of a lighter construction than the brass ones, by which he supposed that a very great saving would be made in the expence; and likewise, that the guns of the new construction would be more manageable, and even efficacious, than the old ones. "The reduction of the expence (says Mr Muller) of the very large artillery necessary for sea and land service, is to be considered under two heads: the one, To diminish the weight; and the other, Not to use any brass field-artillery, but only iron, to lessen the great burden of our ships of war, and to carry larger calibers than those of other nations of the same rate. If the weights of our guns are diminished, they will require fewer hands to manage them, and of consequence a smaller number will be exposed to danger at a time: and if we carry larger calibers, our rates will be a match for larger ships.

42
Mr Muller's proposal for reducing the weight of guns.

"The advantage of using iron guns in the field instead of brass, will be that the expences are lessened in proportion to the cost of brass to that of iron, which is as 8 to 1.

"The only objection against iron is, its pretended brittleness: but as we abound in iron that is stronger and tougher than any brass, this objection is invalid. This I can assert; having seen some that cannot be broken by any force, and will flatten like hammered iron: if then we use such iron, there can be no danger of the guns bursting in the most severe action.

"Though brass guns are not liable to burst, yet they are sooner rendered unserviceable in action than iron. For by the softness of the metal, the vent widens so soon, and they are so liable to bend at the muzzle, that it would be dangerous to fire them; as we found by experience at Belleisle, and where we were obliged to take guns from the ships to finish the siege.

"These being undeniable facts, no possible reason can be assigned against using iron guns in both sea and land service, and thereby lessen the expences of artillery so considerably as will appear by the following tables.

Lengths and Weights of Iron Ship-Guns.

OLD PIECES.			NEW PIECES.		
Calib.	Length.	Weight.	Calib.	Length.	Weight.
	Ft. In.			Ft. In.	
3	4 6	7 1 7	3	3 6	3 3 0
4	6 0	12 2 13	6	4 4	7 2 0
6	7 0	17 1 14	9	5 0	11 1 0
9	7 0	23 2 2	12	5 6	15 0 0
12	9 0	32 3 3	18	6 4	22 2 0
18	9 0	41 1 8	24	7 0	30 0 0
24	9 0	48 0 0	32	7 6	40 0 0
32	9 6	53 3 23	42	8 4	52 2 0
42	10 0	55 1 12	48	8 6	60 0 0

"Guns of this construction appear sufficiently strong from the proof of two three-pounders made for Lord Egmont, and they even may be made lighter and of equal service.

Length and Weight of Battering Pieces.

OLD BRASS.			NEW IRON.		
Calib.	Length.	Weight.	Calib.	Length.	Weight.
	Ft. In.			Ft. In.	
6	8 0	19 1 0	6	6 1	9 1 0

Total 227.

Total 151.

Diff. 72.

"That these guns are sufficiently strong, is evident from the former trial; besides, there are several 32 pounders of the same dimensions and weight now existing and serviceable; though cast in king Charles II.'s time.

N. B.

Practice. N. B These battering pieces may serve in garri- fons.

“ It appears from these tables, that no proportion has been observed in any guns hitherto made, in respect to their length or weight, but merely by guess.

Some Examples to show what may be saved by this Scheme.

The old Royal George carried 100 brafs guns, which weighed together 218.2 tons; the ton costs 130 pounds, workmanship included.

The expence of these guns is then 28366 pounds

A set of iron guns of the same number and calibers, according to my construction, weighs 127.8 tons

The ton cost 16 pounds, and the whole set 2044.8 pounds

The Royal George carries then 90.4 tons more than is necessary, and the difference between the expence is 26321.2 pounds

That is, 12.5 times more than the new iron set costs: or 12 ships of the same rate may be fitted out at less charge.

A set of the { Old } iron guns for a { 204.4 } tons
{ New } first-rate weighs { 127.8 }

The difference between the weight of the old and new is 76.6 tons

The difference between the expence is then 1225.6 pounds

A set of brafs battering pieces weighs 11.36 tons

A ton costs 130 pounds, and the set 1476.8 pounds

A set of the new weighs 7.55 tons

The ton costs 16 pounds, and the set 117.8 pounds

That is, the old set costs 11 times, and 632 over, more than the new set; or 11 sets of the new could be made at less expence than one of the old.

“ This table shows what may be saved in the navy; and if we add those on board sloops, the different garri- sons, and the field train, with the great expence of their carriage in the field, it may be found pretty near as much more.

Num of Guns	Weight of Old.	Weight of New.	Differ.	Num of Ships	Total Difference
100	4367 3	2556 0	1811 3	5	9058 0

This and other propofals for reducing the weight and expence of guns have been greatly attended to of late; and the Carron-company in Scotland have not only greatly improved those of the old construction, but a gun of a new construction hath been invented by Mr Charles Gascoigne director of that work, which promises to be of more effectual service than any hitherto made use of. — Fig. 6. represents the form and proportions of the guns made at Carron, and which serve for those of all sizes, from $\frac{1}{2}$ pounders and upwards. The proportions are measured by the diameters of the caliber, or bore of the gun, divided into 16 equal parts, as represented in the figure. The following are the names of the different parts of a cannon.

AB, the length of the cannon.

AE, the first reinforce.

EF, the second reinforce.

FB, the chase.

HB, the muzzle.

Ao, the cascabel, or pomiglion.

AC, the breech.

CD, the vent-field.

FI, the chase-girdle.

rs, the base-ring and ogee.

t, the vent-astragal and fillets.

pq, the first reinforce-ring and ogee.

vw, the second reinforce ring and ogee.

x, the chase-astragal and fillets.

z, the muzzle-astragal and fillets.

n, the muzzle mouldings.

m, the swelling of the muzzle.

Ai, the breech mouldings.

TT, the trunnions.

The dotted lines along the middle of the piece show the dimensions of the caliber, and the dotted circle shows the size of the ball. Fig. 7. shows a cohorn made also at Carron, and which may be measured by the same scale.

As the breech of the cannon receives an equal impulse with the bullet from the action of the inflamed gunpowder, it thence follows, that at the moment the bullet flies off, the piece itself pushes backward with very great force. This is called the recoil of the cannon; and if the piece is not of a very considerable weight, it would fly upwards, or to a side, with extreme violence. If again it was firmly fastened down, so that it could not move in the least, it would be very apt to burst, on account of the extreme violence with which the powder would then act upon it. For this reason it hath been found necessary to allow the recoil to take place, and consequently all large pieces of artillery are mounted upon carriages with wheels, which allow them to recoil freely; and thus they may be fired without any danger. There are several sorts of carriages for ordnance, viz. bastard carriages, with low wheels and high wheels; sea-carriages, made in imitation of those for ship-guns; and carriages for field-pieces, of which there are two kinds. The carriages must be proportioned to the pieces mounted on them. The ordinary proportion is for the carriage to have once and a half the length of the gun, the wheels to be half the length of the piece in height. Four times the diameter or caliber gives the depth of the planks in the fore end; in the middle $3\frac{1}{2}$.

Description
of the car-
ronade.* See Car-
ronade.

Fig. 8. shows Mr Gascoigne's newly-invented or rather improved gun called a *carronade**; and which, in June 1779, was by the king and council instituted a standard navy-gun, and 10 of them appointed to be added to each ship of war, from a first-rate to a sloop. Of this gun the Carron company have published the following account.

"The carronade is made so short, that it is worked with its carriage in the ship's port; the trunnions lying immediately over the fill of the port: it is correctly bored; and the shot being perfectly round, fills the caliber with such exactness, that the least possible of the impulse of the powder escapes, upon explosion, between the cylinder and the shot; which last also is thereby more truly directed in its flight. The bottom of the cylinder is a hemisphere, to which the end of the cartridge is not liable to stick, and in which the smallest charge of powder envelopes the shot, exhausting nearly the whole of its impelling force upon it: the trunnions are placed so as to lessen the recoil, and that the gun cannot rest against the sides of the carriage, and is balanced with the utmost facility. There are views cast upon the vent and muzzle, to point the gun quickly to an object at 250 and 500 yards distance. There is an handle A fixed upon the pommel-end of the gun, by which it is horizontally ranged and pointed; and there is a ring cast upon the cascabel, through which the breechin rope is reeved, the only rope used about these guns.

"The carronade is mounted upon a carriage B, with a perfectly smooth bottom of strong plank, without trucks; instead of which there is fixed on the bottom of the carriage, perpendicular from the trunnions, a gudgeon C of proper strength, with an iron washer D and pin E at the lower end thereof. This gudgeon is let into a corresponding groove F, cut in a second carriage G, called a *slide-carriage*; the washer supported by the pin over-reaching the under-edges of the groove H. This slide-carriage is made with a smooth upper surface, upon which the gun-carriage is moved, and by the gudgeon always kept in its right station to the port; the groove in the slide-carriage being of a sufficient length to allow the gun to recoil and be loaded within board. The slide-carriage, the groove included, is equally broad with the fore-part of the gun-carriage, and about four times the length; the fore-part of the slide-carriage is fixed by hinge-bolts I, to the quick-work of the ship below the port, the end lying over the fill, close to the outside plank, and the groove reaching to the fore end; the gudgeon of the gun-carriage, and consequently the trunnions of the gun, are over the fill of the port when the gun is run out; and the port is made of such breadth, with its sides bevelled off within board, that the gun and carriage may range from bow to quarter. The slide-carriage is supported from the deck at the hinder end, by a wedge K, or step-stool; which being altered at pleasure, and the fore-end turning upon the hinge-bolts, the carriage can be constantly kept upon an horizontal plane, for the more easy and quick working of the gun when the ship lies along.

"The gun and carriages being in their places, the breechin rope, which must be strong and limber, is reeved through the ring on the breech, then led thro' an eye-bolt drove downwards, the eye standing up-

right upon the upper edge of each cheek of the gun-carriage; from these eye-bolts the ends of the breechin rope are seized down as usual to an eye bolt driven into the quick-work on each side, in a line with the lower surface of the slide-carriage.

"The gun being mounted and ready for action, is loaded with $\frac{1}{12}$ th part of the weight of its ball in service charge of powder put into a woollen cartridge, and the end tied up with a worsted yarn, and placed next to the shot; and with a single ball, well rammed home upon the powder, without a wadding between them: the gun being then run out in the port, is ranged and elevated with great facility, by means of the handle on the pommel; and, by the views, very quickly pointed.—Upon discharge, the gun attempts to kick upwards, which being prevented by the washer of the gudgeon bearing hard against the under part of the slide-carriage, the recoil takes place; and the gudgeon sliding backwards in the groove (the washer still bearing against an iron plate on the under edge of the groove), till the gun is brought up by the breechin rope, as much re-action succeeds as slackens the rope, so that the gun and carriage may be instantly turned fore and aft by the handle, and loaded again.

"This gun has many singular advantages over the others of light construction.—It is so extremely light, that the smallest ships can carry almost any weight of shot (the 12-pounder weighing under 500 wt. and the other calibers in proportion), and that without being attended with the inconveniences imputed generally to light guns, since it cannot injure its carriage, or jump out of its station in the port upon recoil; and it will never heat.

"It can be easily managed and worked of all calibers, from the 12 pounders downwards with two hands, and the 18 and 24-pounders with three hands. It may be readily ranged, pointed, and discharged, twice in three minutes, which doubles the strength of the ship against an enemy of equal force. It is wrought upon an horizontal plane to windward or to leeward how much soever the ship lies along under a pressure of sail; and therefore, besides being hampered with no tackles or other ropes, except the breechin rope, it may be worked with as much ease and expedition in chace or in a gale of wind as in lying to for action.—It can be ranged from bow to quarter, so as to bring a broadside to bear in a circuit of above 10 points of the compass on each side.—It is no more expensive in ammunition than the old guns of two-thirds less weight of shot; and it requires very few hands above the complement necessary for navigating merchant-ships; and increases the strength of privateers crews, by exposing few hands at the guns, and augmenting the number at small arms.

"Though the carronade cannot, strictly speaking, throw its shot to an equal distance with a longer gun; yet, from the fitness of the shot to its cylinder, the powers of this gun will greatly surpass the expectations of such as are not intimately acquainted with the effects of the elastic force of fired powder, since, with $\frac{1}{12}$ th part of the weight of its ball, at very small elevations, it will range its shot to triple the distance at which ships generally engage, with sufficient velocity for the greatest execution, and with all the accuracy in its

Practice.

Practice. its direction that can be attained from guns of greater lengths.

46
Objections
to its use
answered.

"There have been two seeming disadvantages imputed to this gun, which it does not merit, viz. the nicety of fitting the shot to the bore of the gun, and its incapacity to hold more than two shot at one charge. But as seamen have few opportunities of confirming themselves in just opinions by experiments made on shore, and cannot, in that case, be fully conversant with the subject; the following loose hints may not be inept towards removing these objections.

"It is an axiom in projectiles, That a shot cannot be impelled from a gun to any distance in a direction truly parallel to the axis of the cylinder of the piece, or what is commonly called *point-blank*, arising from several well-known causes: for, however just may be the cylinder, and however perfect and smooth may be the sphere of its corresponding shot, and admitting that the impulse of the powder acts through the centre of gravity of the shot, and also that the shot consequently leaves the piece in a direction parallel to the axis of its cylinder; yet is the shot no sooner discharged, but it becomes more or less inflected by its gravity, and deflected, according to its velocity, by the resistance of the air and wind.

"These irregularities are of little importance in close sea-fights, and, being the effect of natural causes, are common to all. Besides these, the deviation of a shot from its true direction, is further augmented by the windage between the cylinder and its shot; but the greatest uncertainty in the flight of a shot, making allowance for the action of its gravity, and the air's resistance, springs from the defects of the shot itself. Round-shot for ship-guns are seldom nicely examined; and, unless they are cast *solid and truly globular*, and free of all hollows, roughness, and other outside blemishes, and well fitted to the gun, it cannot even be discharged in the direction of the axis of the piece; to the disappointment of those that use such, and to the discredit of the gun-founder, however justly the piece is viewed, or disparted; but, being impelled against the surface of the cylinder, bounds and rebounds from side to side, acquires a rotatory motion, and when cast hollow withal, and breaking within the cylinder before discharge, (which sometimes happens, especially with double charges), never fails to injure; and, when often repeated, may at last burst the very best guns.—Round-shot should not be taken on board a ship, without being examined as to its shape and surface, gaged for its

size to the caliber of the gun, and weighed that it be not above or below the standard more than half an ounce in the pound of its respective caliber: good shot then, being of the same importance to all guns, removes the first objection.

"If the direction of the flight of a shot to its object is affected by so many seeming trivial causes, how much more uncertain must it be, when two or more shot are discharged together from one gun? for the shot next the powder being impelled with more celerity than that immediately before it, strikes against it after discharge, and sometimes shivers itself to pieces, and never fails to change obliquely the direction of both; and this happens with round and double-headed, &c. and all double charges; and which, from their various figures, cannot reach an object at the same elevations with the round-shot; especially when these other shots are of greater weight than the round, which is often the case. However frightful a broadside with double charges may appear at sea, more confusion is created by them, and more time lost, *within board*, by the strain and excessive recoil, than real damage done *without board* by the additional charge: for upon a trial on shore, where the effect can be traced, it will be found, that, at 100 yards distance, more shot will take place within a small compass by single than by double charges; and the charges will be oftener repeated in a given time, without heating the gun: and these facts being established, remove also the second objection."

The following account of the proof of one of these guns will perhaps serve to give a more adequate idea of the great usefulness of them, than any description:

"On Monday, Oct. 4. 1779, there was an experiment made at Carron, before the earl of Dunmore, &c. &c. with a 68 pounder carronade, nearly of the weight of a British navy 12-pounder gun, and charged with the same quantity (viz. 6 lb.) of powder.—The carronade was mounted, on its proper carriages, into a port of the dimensions of a 74 gun ship's lower-deck port; was pointed without elevation, at a centre of eight inches diameter, marked on a bulk's head of the thickness of two feet five inches solid wood, at 163 yards distance; behind which, at 168 yards, there was another bulk's head of two feet four inches thick; and behind that again, at 170 yards distance, a bank of earth. The shot pierced the bulk's heads each time, and was buried from three to four feet into the bank, and the splinters were thrown about to a considerable distance on all sides.

1st shot struck	1 foot 7 inches below the horizontal line,	and	5 feet	—	from the mark.
2d ditto ditto	2 feet	ditto,	2 ditto	—	from ditto.
3d do. do.	through the horizontal line	and	3 do.	4 inches	from do.
4th do. do.	ditto	—	2 do.	4 ditto	from do.
5th do. do.	ditto	—	2 do.	10 do.	from do.
6th do. do.	2 inches below	—	—	10 do.	from do.
7th do. do.	touched the lower part of ditto	do.	—	7 do.	from do.
8th do. do.	2 inches below	—	—	10 do.	from do.
9th do. do.	2 feet below	—	1 foot	9 do.	from do.
10th do. do.	3 inches below	—	—	3 do.	from do.

"The Carronade was laid each time by the views without an instrument; and the shot were all to the left of the mark, owing to a small error in disparting the views; the third, fourth, and fifth shot, made one

fracture, as did also sixth, seventh, and eighth, and the sixth and eighth struck the same spot.

"The Carronade was easily worked with four men, and may be readily worked and discharged on board a ship."

Practice. ship twice a minute with six men.—With six pound weight of powder the shot was impelled with a velocity of 1400 feet a second."

47
Description
of rifled
ordnance.

We have already seen of how much consequence rifle-barrels are in order to bring the art of gunnery to perfection; as they enlarge the space in which the ball will fly without any lateral deflection to three or four times its usual quantity. This improvement, however, till very lately, only took place in musket-barrels. But in the beginning of the year 1774, Dr Lind, and Captain Alexander Blair of the 69th regiment of foot, invented a species of rifled field-pieces. They are made of cast iron; and are not bored like the common pieces, but have the rifles moulded on the core, after which they are cleaned out and finished with proper instruments.

Guns of this construction, which are intended for the field, ought never to be made to carry a ball of above one or two pounds weight at most; a leaden bullet of that weight being sufficient to destroy either man or horse.—A pound-gun, of this construction, of good metal, such as is now made by the Carron company, need not weigh above an hundred pounds weight, and its carriage about another hundred. It can, therefore, be easily transported from place to place, by a few men; and a couple of good horses may transport six of these guns and their carriages, if put into a cart.

But, for making experiments, in order to determine the resistance which bodies moving with great velocities meet with from the air, a circumstance to which these guns are particularly well adapted, or for annoying an enemy's sappers that are carrying on their approaches towards a besieged place, a larger caliber may be used.

Fig. 9.

The length of the gun being divided into seven equal parts, the length of the first reinforce AB is two of these parts; the second BC, one and $\frac{1}{2}$ of the diameter of the caliber; the chase CD, four wanting $\frac{1}{10}$ of the diameter of the caliber.

The distance from the hind-part of the base-ring A to the beginning of the bore, is one caliber and $\frac{1}{10}$ of a caliber. The trunnions TT are each a caliber in breadth, and the same in length; their centres are placed three-sevenths of the gun's length from the hind part of the base-ring, in such a manner that the axis of the trunnions passes through the centre line of the bore, which prevents the gun from kicking, and breaking its carriage. The length of the cascable is one caliber and $\frac{1}{10}$ of a caliber.

The caliber of the gun being divided into 16 equal parts;

Practice.

The vent should be placed about half an inch from the bottom of the chamber or bore, that the cartridge may be pricked, lest some of the bottoms of the cartridges should be left in when the gun is sponged, a circumstance which might retard the firing till the shot be again drawn (which is no easy matter), and the gun be cleaned out. From some experiments of colonel Desaguliers and Mr Muller, it has been imagined, that the powder never has so strong an effect as when it is fired close to the bottom of the bore; yet it is found, by the experiments of Count de la Lippe, to have the greatest effect when fired near to the middle of the charge. This he proved by firing it with tubes, introduced at a vent bored through the button and breech of the gun, of different lengths, so as to reach the different parts of the powder. In the same manner, a musket or fowling-piece is found to push more when the touch-hole is placed at some little distance from the bottom of the bore; which arises from nothing but the powder's acting with more force, by being inflamed to greater advantage; consequently, in this case, the same quantity of powder will have a greater effect, than when the touch hole is placed at the bottom of the bore, which may be of some use in husbanding the powder.

The above dimensions are taken from some elegant $\frac{1}{2}$ pound guns, which were made for the prince of Asturias by the Carron company.

The rifles make one spiral turn in the length of the bore; but go no nearer to the breech, in their full size, than two calibers; and then terminate with a gentle slope in half a caliber more, so as not to prevent the cartridge with the powder from being easily sent home to the bottom of the gun, which would otherwise constantly happen with the flannel cartridges, and even sometimes with paper ones, if not made to enter very loosely. The shape of the rifles is semicircular, their breadth being equal to the diameter, which is $\frac{3}{8}$ of a caliber, and their depth equal to the semidiameter, or $\frac{1}{2}$ of a caliber.

The bullets, fig. 10. are of lead, having six knobs cast on them to fit the rifles of the gun. Being thus made of soft metal, they do not injure the rifles; and may also save an army the trouble of carrying a great quantity of shot about with them, since a supply of lead

Practice. lead may be had in most countries from roofs, &c. which can be cast into balls as occasion requires. Lead likewise being of greater specific gravity than cast-iron, flies to a much greater distance.

Rifled ordnance of any caliber might be made to carry iron shot, for battering or for other purposes; provided holes, that are a little wider at their bottoms than at their upper parts, be cast in a zone round the ball, for receiving afterwards leaden knobs to fit the rifles of the cannon; by which means, the iron shot will have its intended line of direction preserved, without injuring the rifles more than if the whole ball was of lead, the rotatory motion round its axis, in the line of its direction (which corrects the aberration) being communicated to it by the leaden knobs, following the spiral turn of the rifles in its progress out of the gun. It is particularly to be observed, that the balls must be made to go easily down into the piece, so that the cartridge with the powder and the bullet may be both sent home together, with a single push of the hand, without any wadding above either powder or ball; by which means, the gun is quickly loaded, and the ball flies farther than when it is forcibly driven into the gun, as was found from many experiments. The only reason why, in common rifled muskets, the bullets are rammed in forcibly, is this, that the zone of the ball which is contiguous to the inside of the bore may have the figure of the rifles impressed upon it, in such a manner as to become part of a male screw, exactly fitting the indents of the rifle, which is not at all necessary in the present case, the figure of the rifles being originally cast upon the ball. These knobs retard the flight of the bullet in some degree; but this small disadvantage is fully made up by the ease with which the gun is loaded, its service being nearly as quick as that of a common field-piece; and the retardation and quantity of the whirling motion which is communicated to the bullet being constantly the same, it will not in the least affect the experiments made with them, in order to determine the resistance of the air.

48
Sector and
telescope
belonging
to this
kind of
ordnance.

In order to hit the mark with greater certainty than can be done in the common random method, these guns are furnished with a sector, the principal parts of which are, 1. The limb, which is divided in such a manner as to show elevations to 15 or 20 degrees. The length of the radius is five inches and an half, and its nonius is so divided as to show minutes of a degree. 2. The telescope, AB, fig. 11. an achromatic refractor, is seven inches in length (such as is used on Hadley's quadrants, that are fitted for taking distances of the moon from the sun or stars, in order to obtain the longitude at sea), having cross hairs in it. 3. The parallel cylindric bar, CD, is $\frac{4}{8}$ of an inch in diameter, having two rectangular ends EF, each half an inch square and an inch long. On one side of the end next the limb of the sector, is a mark corresponding to a similar one in the hinder cock of the gun, with which it must always coincide when placed on the gun. The length of the parallel bar, together with its ends, is seven inches. This bar is fixed to the sector by means of two hollow cylinders, G, H, which allow the sector a motion round the bar. There is a finger-screw, *a*, upon the hollow cylinder G, which is slit, in order to tighten it at pleasure upon the bar. 4. The circular level I, fig. 11. and 12. for setting the plane of the

Practice. sector always perpendicular when placed upon the gun, is $\frac{3}{4}$ of an inch in diameter. There is a small screw, *d*, to adjust the level at right angles to the plane of the sector. 5. The finger-screw, *b*, for fixing the index of the sector at any particular degree of elevation proposed.

The line of collimation (that is, the line of vision cut by the intersecting point of the two cross-hairs in the telescope) must be adjusted truly parallel to the bar of the sector when at 0 degrees. This is done by placing the sector so that the vertical hair may exactly cover some very distant perpendicular line. If it again covers it when the sector is inverted, by turning it half round upon the bar, which has all the while been kept steady and firm, that hair is correct; if not, correct half the error by means of the small screws, *c d e*, fig. 11. and 13. at the eye-end of the telescope, and the other half by moving the bar; place it again to cover the perpendicular line, and repeat the above operation till the hair covers it in both positions of the sector. Then turn the sector, till the horizontal hair cover the same perpendicular line; and turning the sector half round on its bar, correct it, if wrong, in the same manner as you did the vertical hair.

N. B. Of the four small screws at the eye-end of the telescope, those at the right and left hand move whatever hair is vertical, and those at top or underneath move whatever hair is horizontal.

On the side of the gun upon the first reinforce, are cast two knobs, F, fig. 9. and 14. having their middle part distant from each other six inches, for fixing on the brass cocks, A, fig. 14. and 15. which receive the rectangular ends of the parallel cylindric bar of the sector, when placed on the gun.

The next adjustment is to make the parallel bar, and line of collimation of the telescope, when set at 0 degrees, parallel to the bore of the gun, and consequently to the direction of the shot. The gun being loaded, the cartridge pricked, and the gun primed, place the sector in the cocks of the gun; and having first set the sector to what elevation you judge necessary, bring the intersection of the cross hairs in the telescope upon the centre of the mark, the limb of the sector being set vertical by means of the circular level, and then take off the sector without moving the gun. Fire the gun; and if the bullet hits any where in the perpendicular line, passing through the centre of the mark, the line of collimation of the telescope and direction of the shot agree. But if it hit to the right of the mark, so much do they differ. In order to correct which, bring the gun into the same position it was in before firing, and secure it there. Then file away as much of the fore-cock, on the side next the gun, as will let the intersection of the cross-hair fall somewhere on the line passing perpendicularly through the point where the shot fell; and it is then adjusted in that position, so much being filed off the side of the cock at *a*, fig. 14. and 18. as will allow the side *b* to be screwed closer, that the ends of the parallel bar may have no shake in the cocks. To correct it in the other position, and so to find the true 0 degrees of the gun, that is, to bring the line of collimation of the telescope, parallel-bar, and bore of the gun, truly parallel to each other, repeat the above with the trunnions perpendicular to the horizon, the sector being turned a quarter round upon its bar

Practice.

bar, so as to bring its plane vertical. The deviation of the shot found in this way is corrected by deepening one of the cocks, so that the vertical hair of the telescope may be brought to cover the line passing perpendicularly through the point where the bullet hits; the gun being placed in the same position it was in before it was fired. This adjustment being repeated two or three times, and any error that remains being corrected, the gun is fit to be mounted on its carriage for service. It is to be observed, that this sector will fit any gun, if the cocks and rectangular ends, &c. of the parallel bar be of the above dimensions, and will be equally applicable to all such pieces whose cocks have been adjusted, as if it had been adjusted separately with each of them. And if the sector be set at any degree of elevation, and the gun moved so as to bring the intersection of the cross-hairs on the object to be fired at (the limb of the sector being vertical), the bore of the gun will have the same elevation above it, in the true direction of the shot, whatever position the carriage of the gun is standing in. A telescope with cross hairs, fixed to a common rifled musket, and adjusted to the direction of the shot, will make any person, with a very little practice, hit an object with more precision than the most experienced marksman.

49
Their car-
riages.

For garrison-service, or for batteries, the ship or garrison carriage, with two iron staples on each side to put through a couple of poles to carry these guns from place to place with more dispatch, are as proper as any. But, for the field, a carriage like that at fig. 16. where the shafts push in upon taking out the iron pins *ab*, and moving the cross bar *A*, upon which the breech of the gun rests, as far down as the shafts were pushed in, is the properest, since the whole can then be carried like a hand-barrow, over ditches, walls, or rough ground, all which may be easily understood from the figure.

The principal advantage that will accrue from the use of rifled ordnance, is the great certainty with which any object may be hit when fired at with them, since the shot deviates but little from its intended line of direction, and the gun is capable of being brought to bear upon the object, with great exactness, by means of the telescope and cross-hairs.

50
Mortars
described

The other pieces of artillery commonly made use of are mortars, howitzers, and royals. The mortars are a kind of short cannon of a large bore, with chambers for the powder, and are made of brass or iron. Their use is to throw hollow shells filled with powder, which falling on any building, or into the works of a fortification, burst, and with their fragments destroy every thing near them. Carcasses are also thrown out of them; which are a sort of shells with five holes, filled with pitch and other materials, in order to set buildings on fire; and sometimes baskets full of stones, of the size of a man's fist, are thrown out of them upon an enemy placed in the covert-way in the time of a siege. Of late the ingenious General Desaguliers has contrived to throw bags filled with grape-shot, containing in each bag from 400 to 600 shot of different dimensions, out of mortars. The effect of these is tremendous to troops forming the line of battle, passing a defile, or landing, &c. the shot pour-

N^o 146.

ing down like a shower of hail on a circumference of above 300 feet. Practice.

Mortars are chiefly distinguished by the dimensions of their bore; for example, a 13th-inch mortar is one the diameter of whose bore is 13 inches, &c.—The land-mortars are those used in sieges, and of late in battles. They are mounted on beds, and both mortar and bed are transported on block carriages. There is likewise a kind of land-mortars mounted on travelling carriages, invented by count Buckeburg, which may be elevated to any degree; whereas all the English mortars are fixed to an angle of 45°. This custom, however, does not appear to have any foundation in reason. In a siege, shells should never be thrown with an angle of 45 degrees, excepting one case only; that is, when the battery is so far off, that they cannot otherwise reach the works: for when shells are thrown out of the trenches into the works of a fortification, or from the town into the trenches, they should have as little elevation as possible, in order not to bury themselves, but to roll along the ground, whereby they do much more damage, and occasion a much greater consternation among the troops, than if they sunk into the ground. On the contrary, when shells are thrown upon magazines, or any other buildings, the mortars should be elevated as high as possible, that the shells may acquire a greater force in their fall, and consequently do more execution.

There are other kinds of mortars, called *partridge-mortars*, *hand-mortars*, and *firelock-mortars*; which last are also called *bombards*. The partridge-mortar is a common one, surrounded with 13 other little mortars bored round its circumference, in the body of the metal; the middle one is loaded with a shell, and the others with grenades. The vent of the large mortar being fired, communicates its fire to the rest; so that both the shell and grenades go off at once. Hand-mortars were frequently used before the invention of cohorns. They were fixed at the end of a staff four feet and a half long, the other end being shod with iron to stick in the ground; and while the bombardier with one hand elevated it at pleasure, he fired it with the other. The firelock-mortars, or bombards, are small mortars fixed to the end of a firelock. They are loaded as all common firelocks are; and the grenade, placed in the mortar at the end of the barrel, is discharged by a flint-lock. To prevent the recoil hurting the bombardier, the bombard rests on a kind of halberd made for that purpose.

The chamber in mortars is the place where the powder is lodged. They are of different forms, and made variously by different nations; but the cylindric seems to be preferable to any other form.

The howitz is a kind of mortar mounted on a field carriage like a gun: it differs from the common mortars in having the trunnions in the middle, whereas those of the mortar are at the end. The construction of howitzes is as various and uncertain as that of mortars, excepting that the chambers are all cylindric. They are distinguished by the diameter of their bore; for instance, a 10-inch howitz is that which has a bore of 10 inches diameter, and so of others. They were much more lately invented than mortars, and indeed are plainly derived from them.

Royals

51
Howitzes
and royals.

Practice

52
Parts of a
mortar.

Royals are a kind of small mortars, which carry a shell whose diameter is 5.5 inches. They are mounted on beds in the same way as other mortars.

Fig. 17. represents a mortar; and the names of its parts are as follow.

AB, the whole length of the mortar.

AC, the muzzle.

CD, chace.

DE, reinforce.

EF, breech.

GH, trunnions.

a, vent.

b, dolphin.

c d, vent-astragal and fillets.

d e, breech-ring and ogee.

f g, reinforce-ring and ogee.

g h, reinforce-astragal and fillets.

i k, muzzle-astragal and fillets.

k l, muzzle-ring and ogee.

l m, muzzle mouldings.

n, shoulders.

Interior parts.

o, chamber.

p, bore.

q, mouth.

r, vent.

The mortar-beds are formed of very solid timber, and placed upon very strong wooden frames, fixed in such a manner that the bed may turn round. The fore-part of these beds is an arc of a circle described from the centre on which the whole turns.

53
Instru-
ments used
in loading
cannon.

There are several instruments employed in the loading of cannon. The names of these are as follow:

1. The lantern or ladle, which serves to carry the powder into the piece, and which consists of two parts, viz. of a wooden box, appropriated to the caliber of the piece for which it is intended, and of a caliber and a half in length with its vent; and of a piece of copper nailed to the box, at the height of a half caliber.—This lantern must have three calibers and a half in length, and two calibers in breadth, being rounded at the end to load the ordinary pieces.

2. The rammer is a round piece of wood, commonly called a *box*, fastened to a stick 12 feet long, for the pieces from 12 to 33 pounders; and 10 for the 8 and 4 pounders; which serve to drive home the powder and ball to the breech.

3. The sponge is a long staff or rammer, with a piece of sheep or lamb-skin wound about its end, to serve for scouring the cannon when discharged, before it be charged with fresh powder; to prevent any spark of fire from remaining in her, which would endanger the life of him who should load her again.

4. Wad-screw consists of two points of iron turned serpent-wise, to extract the wad out of the pieces when one wants to unload them, or the dirt which had chanced to enter into it.

5. The botefeux are sticks two or three feet long, and an inch thick, split at one end, to hold an end of the match twisted round it, to fire the cannon.

6. The priming-iron is a pointed iron-rod, to clear the touch-hole of the pieces of powder or dirt; and also to pierce the cartridge, that it may sooner take fire.

VOL. VIII. Part I.

7. The primer, which must contain a pound of powder at least, to prime the pieces.

8. The quoin of mire, which are pieces of wood with a notch on the side to put the fingers on, to draw them back or push them forward when the gunner points his piece. They are placed on the sole of the carriage.

9. Leaden-plates, which are used to cover the touch-hole, when the piece is charged, lest some dirt should enter it and stop it.

Before charging the piece, it is well sponged, to clean it of all filth and dirt withinside; then the proper weight of gunpowder is put in and rammed down; care being taken that the powder be not bruised in ramming, which weakens its effect; it is then run over by a little quantity of paper, hay, or the like; and lastly, the ball is thrown in.

To point, level, or direct the piece, so as to play against any certain point, is done by the help of a quadrant with a plummet: which quadrant consists of two branches made of brass or wood; one about a foot long, eight lines broad, and one line in thickness; the other four inches long, and the same thickness and breadth as the former. Between these branches is a quadrant, divided into 90 degrees, beginning from the shorter branch, and furnished with thread and plummet.

The longest branch of this instrument is placed in the cannon's mouth, and elevated or lowered till the thread cuts the degree necessary to hit the proposed object. Which done, the cannon is primed, and then set fire to. The method by the sector, however, proposed by Dr Lind, is certainly in all cases to be preferred.

A 24 pounder may very well fire 90 or 100 shots every day in summer, and 60 or 75 in winter. In case of necessity it may fire more; and some French officers of artillery assure, that they have caused such a piece to fire every day 150 shots in a siege.—A 16 and a 12 pounder fire a little more, because they are easier served. There have even been some occasions where 200 shots have been fired from these pieces in the space of nine hours, and 138 in the space of five. In quick firing, tubes are made use of. They are made of tin; and their diameter is two-tenths of an inch, being just sufficient to enter into the vent of the piece. They are about six inches long, with a cap above, and cut slanting below, in the form of a pen; the point is strengthened with some solder, that it may pierce the cartridge without bending. Through this tube is drawn a quick-match, the cap being fitted with mealed powder moistened with spirits of wine. To prevent the mealed powder from falling out by carriage, a cap of paper or flannel steeped in spirits of wine is tied over it. To range pieces in a battery, care must be taken to reconnoitre well the ground where it is to be placed, and the avenues to it. The pieces must be armed each with two lanterns or ladles, a rammer, a sponge, and two priming-irons. The battery must also be provided with carriages, and other implements, necessary to remount the pieces which the enemy should chance to dismount.

To serve expeditiously and safely a piece in a battery, it is necessary to have to each a sack of leather,

F f

large

Practice.

54
Method of
managing
them.

Practice. large enough to contain about 20 pounds of powder to charge the lanterns or ladles, without carrying them to the magazine; and to avoid thereby making those trains of powder in bringing back the lantern from the magazine, and the accidents which frequently happen thereby.

A battery of three pieces must have 30 gabions, because six are employed on each of the two sides or epaulments, which make 12, and nine for each of the two merlons.

There ought to be two gunners and six soldiers to each piece, and an officers of artillery.

The gunner posted on the right of the piece must take care to have always a pouch full of powder and two priming irons: his office is to prime the piece, and load it with powder. The gunner on the left fetches the powder from the little magazine, and fills the lantern or ladle which his comrade holds; after which, he takes care that the match be very well lighted, and ready to set fire to the piece at the first command of the officer.

There are three soldiers on the right and three on the left of the piece. The two first take care to ram and sponge the piece, each on his side. The rammer and sponge are placed on the left, and the lantern or ladle on the right. After having rammed well the wad put over the powder and that put over the bullet, they then take each a handspike, which they pass between the foremost spokes of the wheel, the ends whereof will pass under the head of the carriage, to make the wheel turn round, leaning on the other end of the handspike, towards the embrasure.

It is the office of the second soldier on the right to provide wad, and to put it into the piece, as well over the powder as over the bullet; and that of his comrade on the left to provide 50 bullets, and every time the piece is to be charged to fetch one of them and put it into the piece after the powder has been rammed. Then they both take each an handspike, which they pass under the hind part of the wheel, to push it in battery.

The officer of artillery must take care to have the piece diligently served.

In the night he must employ the gunners and soldiers, who shall relieve those who have served 24 hours to repair the embrasures.

If there be no water near the battery, care must be taken to have a cask filled with it, in which to dip the sponges and cool the pieces every 10 or 12 rounds.

The carriage for a mortar of 12 inches of diameter must be 6 feet long, the flasks 12 inches long and 10 thick. The trunnions are placed in the middle of the carriage.

The carriage of an 18 inch mortar must be 4 feet long, and the flasks 11 inches high and 6 thick.

To mount the mortars of new invention, they use carriages of cast iron.

⁵⁵
**Method of
managing
mortars.**

In Germany, to mount mortars from 8 to 9 inches, and carry them into the field, and execute them horizontally as a piece of cannon, they make use of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trunnions as far as their half diameter, and mounted on two wheels four feet high, to which they join a vantrain propor-

tioned to it, and made like those which serve to the Practice. carriages of cannons.

Having mounted the mortar on its carriage, the next thing is to caliber the bomb by means of a great caliber, the two branches whereof embrace the whole circumference of the bomb: these two branches are brought on a rule where the different calibers are marked, among which that of the bomb is found.

If no defect be found in the bomb, its cavity is filled, by means of a funnel, with whole gunpowder; a little space or liberty is left, that when a fusee or wooden tube, of the figure of a truncated cone, is driven thro' the aperture (with a wooden mallet, not an iron one for fear of accident), and fastened with a cement made of quicklime, ashes, brick-dust, and steel filings, worked together in a glutinous water, or of four parts of pitch, two of colophony, one of turpentine, and one of wax, the powder may not be bruised. This tube is filled with a combustible matter made of two ounces of nitre, one of sulphur, and three or more of gunpowder dust well rammed. See FUZEE.

This fusee set on fire burns slowly till it reaches the gunpowder; which goes off at once, bursting the shell to pieces with incredible violence. Special care, however, must be taken that the fusee be so proportioned as that the gunpowder do not take fire ere the shell arrives at the destined place; to prevent which, the fusee is frequently wound round with a wet clammy thread.

Batteries consist,—1. Of an epaulment to shelter the mortars from the fire of the enemy. 2. Of platforms on which the mortars are placed. 3. Of small magazines of powder. 4. Of a boyau, which leads to the great magazine. 5. Of ways which lead from the battery to the magazine of bombs. 6. Of a great ditch before the epaulment. 7. Of a berm or retraite.

The platforms for mortars of 12 inches must have 9 feet in length and 6 in breadth.—The lambourds for common mortars must be four inches thick; those of a concave chamber of 8 lb. of powder, 5 inches; those of 12 lb. 6 inches; those of 18 lb. 7 inches or thereabouts. Their length is at discretion, provided there be enough to make the platforms 9 feet long.—The forepart of the platform will be situated at two feet distance from the epaulment of the battery.—The bombardiers, to shelter themselves in their battery, and not be seen from the town besieged, raise an epaulment of 7 feet or more high, which epaulment has no embrasures.

To serve expeditiously a mortar in battery, there are required,—five strong handspikes; a dame or rammer, of the caliber of the conic chamber, to ram the wad and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron scraper two feet long, one end whereof must be four inches broad and roundwise, to clean the bore and the chamber of the mortar, and the other end made in form of a spoon to clean the little chamber; a kind of brancard to carry the bomb, a shovel, and pick-ax.

The officer who is to mind the service of the mortar must have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that service; the first must take care to fetch the powder to charge the chamber of the mortar, putting his priming-iron in the touch-hole before he charges the chamber; and

Practice. and never going to fetch the powder before he has asked his officer at what quantity of powder he designs to charge, because more or less powder is wanted according to the distance where it is fired; the same will take care to ram the wad and earth, which another soldier puts in the chamber.

The soldier on the right will put again two shovelful of earth in the bottom of the bore, which should be likewise very well rammed down.

This done, the rammer or dame is returned into its place against the epaulment on the right of the mortar: he takes an handspike in the same place to post himself behind the carriage of the mortar, in order to help to push it into battery: having laid down his handspike, he takes out his priming-iron, and primes the touch-hole with fine powder.

The second soldier on the right and left will have by that time brought the bomb ready loaded, which must be received into the mortar by the first soldier, and placed very strait in the bore or chafe of the mortar.

The first on the right will furnish him with earth to put round the bomb, which he must take care to ram close with the knife given him by the second on the left.

This done, each shall take a handspike, which the two first on the right and left shall put under the pegs of retreat of the forepart, and the two behind under those of the hindpart, and they together push the mortar in battery.

Afterwards the officer points or directs the mortar.

During that time the first soldier takes care to prime the touch-hole of the mortar, without ramming the powder; and the last on the right must have the match ready to set fire to the fusee of the bomb on the right, while the first is ready with his on the left to set fire to the touch-hole of the mortar, which he ought not to do till he sees the fusee well lighted.

The foremost soldiers will have their handspikes ready to raise the mortar upright as soon as it has discharged, while the hindmost on the left shall with the scraper clean the bore and chamber of the mortar.

The magazine of powder for the service of the battery shall be situated 15 or 20 paces behind, and covered with boards and earth over it.—The loaded bombs are on the side of the said magazine, at five or six paces distance.

The officer who commands the service of the mortar must take care to discover as much as possible with the eye the distance of the place where he intends to throw his bomb, giving the mortar the degree of elevation according to the judgment he has formed of the distance. Having thrown the first bomb, he must diminish or increase the degrees of elevation according to the place upon which it shall fall. Several make use of tables to discover the different distances according to the differences of the elevations of the mortar, especially the degrees of the quadrant from 1 to 45: but these, from the principles already laid down, must be fallacious.

56
Of the petard.

The petard is the next piece of artillery which deserves our attention; and is a kind of engine of metal, somewhat in shape of a high-crowned hat, serving to break down gates, barricades, draw-bridges, or the like works, which are intended to be surprised. It is very short, narrow at the breech and wide at the

muzzle, made of copper mixed with a little brass, or of lead with tin.

Practice.

The petards are not always of the same height and bigness: they are commonly 10 inches high, 7 inches of diameter a-top, and 10 inches at bottom. They weigh commonly 40, 45, and 50 pounds.

The madrier, on which the petard is placed, and where it is tied with iron circles, is of two feet for its greatest width, and of 18 inches on the sides, and no thicker than a common madrier. Under the madrier are two iron-bars passed crosswise, with a hook, which serves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of caliber or diameter at the bore, the inside must be first very well cleaned and heated, so that the hand may bear the heat; then take the best powder that may be found, throw over it some spirit of wine, and expose it to the sun, or put it in a frying-pan; and when it is well dried, 5 lb. or 6 lb. of this powder is put into the petard, which reaches within three fingers of the mouth: the vacancies are filled with tow, and stopped with a wooden tampion; the mouth being strongly bound up with cloth tied very tight with ropes; then it is fixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and fastened down with ropes.

Some, instead of gunpowder for the charge, use one of the following composition, *viz.* gunpowder seven pounds, mercury sublimate one ounce, camphor eight ounces; or gunpowder six pounds, mercury sublimate three ounces, and sulphur three; or gunpowder six, beaten glass half an ounce, and camphor three quarters.

Before any of these pieces are appropriated for service, it is necessary to have each undergo a particular trial of its soundness, which is called a *proof*, to be made by or before one authorized for the purpose, called the *proof-master*.

To make a proof of the piece, a proper place is chosen, which is to be terminated by a mount of earth very thick to receive the bullets fired against it, that none of them may run through it. The piece is laid on the ground, supported only in the middle by a block of wood. It is fired three times; the first with powder of the weight of the bullet, and the two others with $\frac{3}{4}$ of the weight; after which a little more powder is put in to singe the piece; and after this, water, which is impressed with a sponge, putting the finger on the touch-hole to discover if there be any cracks; which done, they are examined with the cat, which is a piece of iron with three grasps, disposed in the form of a triangle, and of the caliber of the piece; then it is visited with a wax-candle, but it is of very little service in the small pieces, because if they be a little long the smoke extinguishes it immediately. See Plate CCXXIV.

Besides the large pieces already mentioned, invented for the destruction of mankind, there are others called *small guns*; *viz.* muskets of ramparts, common muskets, fusils, carabines, musketoons, and pistols.

57
Of small arms.

A musket, or musquet, is a fire-arm borne on the shoulder, and used in war, formerly fired by the application of a lighted match, but at present with a flint and lock. The common musket is of the caliber of 20 leaden balls to the pound, and receives balls from 22 to 24: its length is fixed to 3 feet 8 inches from the muzzle to the touch-pan.

Practice.

A fusil, or fire-lock, has the same length and caliber, and serves at present instead of a musket.

A carabine is a small sort of fire-arm, shorter than a fusil, and carrying a ball of 24 in the pound, borne by the light-horse, hanging at a belt over the left shoulder. This piece is a kind of medium between the pistol and the musket; and bears a near affinity to the arquebuss, only that its bore is smaller. It was for-

merly made with a match-lock, but of late only with a flint-lock. Practice.

The musketoon is of the same length of the carabine, the barrel polished, and clean within. It carries five ounces of iron, or seven and a half of lead, with an equal quantity of powder.

The barrel of a pistol is generally 14 inches long.

G U N

Gunpow-
der

GUNPOWDER, a composition of saltpetre, sulphur, and charcoal, mixed together, and usually granulated; which easily takes fire, and, when fired, rarifies or expands with great vehemence, by means of its elastic force.

It is to this powder we owe all the action and effect of guns, ordnance, &c. so that the modern military art, fortification, &c. in a great measure depend thereon.

Invention of GUNPOWDER. See GUN.

Method of making GUNPOWDER. Dr Shaw's receipt for this purpose is as follows: Take four ounces of refined saltpetre, an ounce of brimstone, and six drams of small-coal: reduce these to a fine powder, and continue beating them for some time in a stone mortar with a wooden pestle, wetting the mixture between whiles with water, so as to form the whole into an uniform paste, which is reduced to grains, by passing it through a wire-sieve fit for the purpose; and in this form being carefully dried, it becomes the common gunpowder.

For greater quantities mills are usually provided, by means of which more work may be performed in one day than a man can do in a hundred.

The nitre or saltpetre is refined thus: Dissolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodiously suffice for that purpose: then let it shoot for two or three days in a covered vessel of earth, with sticks laid across for the crystals to adhere to. These crystals being taken out, are drained and dried in the open air.

In order to reduce this salt to powder, they dissolve a large quantity of it in as small a proportion of water as possible; then keep it constantly stirring over the fire till the water exhales and a white dry powder is left behind.

In order to purify the brimstone employed, they dissolve it with a very gentle heat; then scum and pass it through a double strainer. If the brimstone should happen to take fire in the melting, they have an iron cover that fits on close to the melting-vessel, and damps the flame. The brimstone is judged to be sufficiently refined if it melts, without yielding any fetid odour, between two hot iron-plates, into a kind of red substance.

The coal for the making of gunpowder is either that of willow or hazel, well charred in the usual manner, and reduced to powder. And thus the ingredients are prepared for making this commodity: but as these ingredients require to be intimately mixed, and as there would be danger of their firing if beat in a dry form, the method is to keep them continually moist,

G U N

Gunpow-
der.

either with water, urine, or a solution of sal ammoniac: they continue thus stamping them together for 24 hours; after which the mass is fit for corning and drying in the sun, or otherwise, so as sedulously to prevent its firing.

Different kinds of GUNPOWDER. The three ingredients of gunpowder are mixed in various proportions according as the powder is intended for muskets, great guns, or mortars: though these proportions seem not to be perfectly adjusted or settled by competent experience.

Semienowitz, for mortars, directs an hundred pounds of saltpetre, twenty-five of sulphur, and as many of charcoal; for great guns, an hundred pounds of saltpetre, fifteen pounds of sulphur, and eighteen pounds of charcoal; for muskets and pistols, an hundred pounds of saltpetre, eight pounds of sulphur, and ten pounds of charcoal. Miethius extols the proportion of one pound of saltpetre to three ounces of charcoal, and two or two and a quarter of sulphur; than which, he affirms, no gunpowder can possibly be stronger. He adds, that the usual practice of making the gunpowder weaker for mortars than guns, is without any foundation, and renders the expence needlessly much greater: for whereas to load a large mortar, twenty-four pound of common powder is required, and consequently, to load it ten times, two hundred and forty pound, he shows, by calculation, that the same effect would be had by one hundred and fifty pound of the strong powder.

On this subject Mr Thomson† observes, that almost all those who have written upon gunpowder, particularly those of the last century, have given different receipts for its composition; and he proposes it as a query, Whether these differences have not arisen from observing that some kinds of powder were better adapted to particular purposes than others, or from experiments made on purpose to ascertain the fact? "There is one circumstance (he says) that would lead us to suppose that this was the case. That kind of powder designed for mortars and great guns was weaker than that intended for small arms: for if there is any foundation for these conjectures, it is certain, that the weakest powder, or the heaviest in proportion to its elastic force, ought to be used to impel the heaviest bullets; and particularly in guns that are imperfectly formed, where the vent is large, and the windage very great. I am perfectly aware (adds he), that an objection may here be made, viz. that the elastic fluid generated from gunpowder must be supposed to have the same properties very nearly, whatever may be the proportion of its several ingredients; and that therefore the only difference there can be in powder is, that

† Phil.
Trans.
vol. 72.

one

Gunpow-
der.Gunpow-
der.

one kind may generate more of this fluid, and another less; and that when it is generated it acts in the same manner, and will alike escape, and with the same velocity, by any passage it can find. But to this I answer, that though the fluid may be the same, as it undoubtedly is, and though its density and elasticity may be the same in all cases at the instant of its generation; yet in the explosion, the elastic and unelastic parts are so mixed together, that I imagine the fluid cannot expand without taking the gross matter along with it; and the velocity with which the flame issues at the vent is to be computed from the elasticity of the fluid, and the density or weight of the fluid and gross matter taken together, and not simply from the density and elasticity of the fluid."

To increase the strength of powder, Dr Shaw thinks it proper to make the grains considerably large, and to have it well sifted from the small dust. We see that gunpowder, reduced to dust, has little explosive force; but when the grains are large, the flame of one grain has a ready passage to another, so that the whole parcel may thus take fire nearly at the same time, otherwise much force may be lost, or many of the grains go away as shot unfired.

In the 71st volume of the Phil. Trans. Mr Thomson gives an account of several attempts to augment the force of gunpowder by the addition of different ingredients. The power of steam has by many been overrated to such a degree, as to be supposed capable of answering the purposes of gunpowder; but no attempts to accomplish this have ever succeeded in any degree. Mr Thomson attempted to combine the forces of steam and gunpowder together in the following manner. Having procured a number of air bladders of very small fishes, he put different quantities of water into them from the size of a small pea to that of a pistol bullet, and tying them up with some very fine thread, hung them up to dry on the outside. He then provided a number of cartridges made of fine paper, and filled them with a quantity of gunpowder equal to the usual charge for a common horseman's pistol. He then loaded the pistol with a bullet, fired it against an oaken plank about six feet from the muzzle, and observed the recoil and penetration of the bullet. He next tried the effect of one of these small bladders of water when put among the gunpowder, but always found the force of the powder very much diminished, and the larger the quantity of water the greater was the diminution; the report of the explosion was also diminished in a still greater proportion than the force of the bullet or recoil. It being supposed that the bladder had burst, and thus by wetting the gunpowder prevented it from taking fire, the experiment was repeated with highly rectified spirit of wine, but the diminution of the force was very little inferior to what it had been with water. Etherial oil of turpentine and small quantities of quicksilver were also tried, but with no better success than before. Thinking, however, that the failure of the quicksilver might be owing to its having been too much in a body, the experiment was repeated with the metal dispersed in small particles through the powder. To accomplish this dispersion the more completely, 20 grains of Ethiops mineral were mixed very intimately with 145 grains of powder; but still the force of the bullet was much less than if

the powder had been used without any addition. As the explosion of pulvis fulminans appears vastly superior to that of gunpowder, some salt of tartar, in its purest state, was mixed in the proportion of 20 grains to 145 of powder; but on firing the piece, it was still found that the force of the explosion was lessened. Sal ammoniac was next tried; which, under certain circumstances, is found to produce a great quantity of air or elastic vapour; but on mixing 20 grains of it with 145 of gunpowder, the force of the explosion was still found to be diminished. As most of the metals, when dissolved in acids, particularly brass in spirit of nitre, are found to produce much elastic vapour, it was thought worth while to try whether the force of powder could be augmented by this means. Twenty grains of brass dust were therefore mixed with 145 grains of powder; but still the force of the explosion was not augmented. In our author's opinion, however, neither brass dust nor Ethiops mineral diminish the force of the explosion otherwise than by filling up the interstices between the grains, obstructing the passage of the flame, and thus impeding the progress of the inflammation. Thus it appears, that little hope remains of augmenting the force of gunpowder by any addition either of liquid or inflammable solids: the reason is obvious; viz. because all of them, the liquids especially, absorb great quantities of heat before they can be converted into vapour; and this vapour, after it is formed, requires more heat to make it expand more forcibly than air; hence, as the effects of gunpowder depend entirely upon the emission of a quantity of air, and its rarefaction by vehement heat, the power must be greatly diminished by the absorption of this heat, which ought to be spent in rarefying the air. Even solid bodies cannot be set on fire without a previous absorption of heat to convert them into vapour*; but liquids have this property still more than solids, as is explained under the articles CHEMISTRY, EVAPORATION, &c. and must therefore diminish the explosive force still more. Lime added to gunpowder, however, is said to augment the power of the explosion by one third.

In his experiments on gunpowder, Mr Thomson had the curiosity to compare the strength of aurum fulminans, when inclosed in a gun-barrel, with that of common gunpowder; but his experiment only verified what has been found by others, viz. that this powder, which in the open air makes such a very violent report, has in close vessels scarce any power, comparatively speaking, either of explosion or projecting a bullet. Mr Thomson, however, taking it for granted that the power of aurum fulminans would be found much greater than that of gunpowder, took care to have a barrel of uncommon strength prepared for the experiment. The weight of it was 7 lb. 5 oz.; the length 13.25 inches, and the width of the bore 0.55 inches. This barrel, being charged with 27.44 grains of aurum fulminans and two leaden bullets, which, together with the leather put about them to make them fit the bore without windage, weighed 427 grains: it was laid upon a chaffing-dish of live coals at the distance of about ten feet from the pendulum, and the piece was directed against the centre of the pendulum. Some minutes elapsed before the powder exploded; but when it did so, the explosion

See Flame.

Gunpow-
der.

did not much exceed the report of a well charged air-gun; and it was not until he saw the pendulum in motion, that Mr Thomson could be persuaded that the bullets had been discharged. On examination, however, it was found that nothing had been left in the barrel, and that the powder had probably been all exploded, as a great many particles of the revived metal were thrown about. From a calculation of the motion communicated to the pendulum, it was found that the velocity of the bullets had been about 428 feet in a second; whence it appears that the power of aurum fulminans, compared with that of gunpowder, is only as 4 to 13 very nearly.

Method of Trying and Examining GUNPOWDER. There are two general methods of examining gunpowder; one with regard to its purity, the other with regard to its strength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing one of them. For if this takes fire readily, and the smoke rises upright, without leaving any dross or feculent matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the sulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together: but if the other heaps also take fire at the same time, it is presumed, that either common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass not well beat and mixed together; and if either the nitre or sulphur be not well purified, the paper will be black or spotted.

Several instruments have been invented to try the strength of gunpowder; but they have generally been complained of as inaccurate. Mr Thomson, in the 71st volume of the Philosophical Transactions, gives an account of an exact method of proving the strength of it. "As the force of powder (says he) arises from the action of an elastic fluid that is generated from it in its inflammation, the quicker the charge takes fire, the more of this fluid will be generated in any given short space of time, and the greater of course will its effect be upon the bullet. But in the common method of proving gunpowder, the weight by which the powder is confined is so great in proportion to the quantity of the charge, that there is time quite sufficient for the charge to be all inflamed, even when the powder is of the slowest composition, before the body to be put in motion can be sensibly removed from its place. The experiment therefore may show which of the two kinds of powder is the strongest, when equal quantities of both are confined in equal spaces, and both completely inflamed; but the degree of the inflammability, which is a property essential to the goodness of the powder, cannot by these means be ascertained. Hence it appears how powder may answer to the proof, such as is commonly required, and may nevertheless turn out very indifferent when it comes to be used in service. But though the common powder-tryers may show powder to be better than it really is, they can never make it appear to be worse than it is; it will therefore always be the interest of those who manufacture the commodity to adhere to the old method of proof, but the purchaser will find his account in having it examined in a method by which its goodness may be ascertained with greater precision."

Gunpow-
der.

In order to determine the goodness of powder by Mr Thomson's method, it is necessary to have a barrel suspended by two iron rods in such a manner that it can easily move backward or forward by the vibration of the rods; and the space it moves through ascertained by marking it on a piece of ribbon. The barrel being then charged with powder, and fitted with a proper bullet, is to be fired, and the recoil marked upon the ribbon. The experiment is to be repeated three or four times, or oftener if there is any difference in the recoil; the extremes of which may be marked with black lines on the ribbon, and the word *proof* written upon the middle line betwixt the two. But if the experiments are made with sufficient accuracy, there will commonly be very little difference in the length to which the ribbon is drawn out. Thus the comparative goodness of powder may easily be ascertained; for the stronger the powder is, the greater will be the recoil, and consequently the greater length to which the ribbon will be drawn out; and if care is taken in proportioning the charge to the weight of the bullet, to come as near as possible to the medium proportion that obtains in practice, the determination of the goodness of gunpowder from the result of this experiment cannot fail to hold good in actual service. The bullets should be made to fit the bore with very little windage; and it would be better if they were all cast in one mould and in the same parcel of lead; as in that case their weights and dimensions would be more accurately the same; and the experiments would of course be more conclusive. The stated charge of powder might be half an ounce, and it should always be put up in a cartridge; and after the piece is loaded, it should be primed with other powder, first taking care to prick the cartridge by thrusting a priming wire down the vent.

From several experiments it appears, that the effect of the charge is considerably augmented or diminished, according to the greater or less force employed in ramming it down. To prevent this inconvenience, Mr Thomson advises the use of a cylindric ramrod of wood, fitted with a metal ring about an inch or an inch and an half in diameter; which being placed at a proper distance from the end which goes up into the bore, will prevent the powder from being too much compressed. In making experiments of this kind, however, it is necessary to pay attention to the heat of the barrel as well as to the temperature of the atmosphere; for heat and cold, dryness and moisture, have a very sensible effect upon gunpowder to augment or diminish its force. When a very great degree of accuracy therefore happens to be requisite, it will be proper to begin by firing the piece two or three times, merely to warm it; after which three or four experiments may be made with standard powder, to determine the proof; mark a second time, for the strength of powder is different at different times, in consequence of the state of the atmosphere. After this the experiments may be made with the powder that is to be proved, taking care to preserve the same interval of time between the discharges, that the heat of the piece may be the same in each trial.

Having thus determined the comparative degrees of strength of two different kinds of powder, their comparative value may be ascertained by augmenting the quantity of the weaker powder till the velocity of the bullets

Gunpow-
der.

bullets in both cases becomes the same. The strong powder is therefore precisely as much more valuable than the weak, as it produces the same effect with a smaller quantity. Thus if a quarter of an ounce of one kind of powder discharges a bullet with the same velocity that half an ounce of another kind does, it is plain that the former is twice as valuable as the latter, and ought to be sold at double the price.—By comparisons of this kind, Mr Thomson found that the best battle powder (so called from its being made at the village of *Battle* in Kent) is stronger than government powder, in the proportion of 4 to 3; but from a comparison of the prices, it appears that the former is no less than $4\frac{1}{3}$ per cent. dearer than it ought to be; and consequently, that whoever uses it in preference to government powder, does it at a certain loss of $4\frac{1}{3}$ per cent. of the money it costs him.

There has been much talk of a white powder, which, if it answered the character given it, might be a dangerous composition; for they pretend that this white powder will throw a ball as far as the black, yet without making a report: but none of the white powder we have seen, says Dr Shaw, answers to this character; being, as we apprehend, commonly made either with touchwood or camphor, instead of coal.

Under the article GUNNERY, the physical cause of the explosion of powder, and the force wherewith it expands, have been so fully considered, that it would be superfluous to add any thing here concerning them. Only we may observe, that though it is commonly made use of for military purposes only in small quantities, and confined in certain vessels; yet when large quantities are fired at once, even when unconfined in the open air, it is capable of producing terrible destruction. The accounts of damage done by the blowing up of magazines, powder-mills, &c. are too numerous and well-known to be here taken notice of. The following is a relation of what even a moderate quantity of powder will accomplish, when fired in the open air. “The king of Navarre took Monsegur. Captain Milon inclosed 500 pounds of powder in a bag, which he found means to introduce, by a drain from the town, into the ditch between two principal gates; the end of the leader was hid in the grass. Every thing being ready to play off this machine, the king gave us leave to go and see its effects; which were surprising. For one of the gates was thrown into the middle of the town, and the other into the field fifty paces from the wall: all the vaults were destroyed, and a passage was made in the wall for three men to enter abreast, by which the town was taken.”—For further accounts of the force of large quantities of powder, see the article MINES.

From this and other accounts of the dreadful effects of gunpowder, when fired in large quantity in the open air, it would seem, that great as its power is in close vessels, it is still greater when the air has access to it; for from the quantity of powder requisite to charge great guns, it is by no means probable that double the quantity of powder confined in fire-arms of any size or capacity, and discharged all at once against the walls, would have produced such effects; especially when we consider that the power must have been equally great at an equal distance all round; so that had there been other walls and gates behind this

quantity of powder as well as before it, they would in all probability have been thrown down also. This conjecture seems to be somewhat confirmed by the great diminution of the force of pulvis fulminans and aurum fulminans when confined in close vessels. Mr Thomson mentions likewise a very singular fact relative to gunpowder, which seems to be somewhat analogous to that just mentioned; and which indeed seems to explain it; namely, that the heat communicated by gunpowder when slightly confined, is much greater than when otherwise. “I was much surprised (says he), upon taking hold of the barrel immediately after an experiment when it was fired with 330 grains of powder without any bullet, to find it so very hot that I could scarce bear it in my hand, evidently much hotter than I had ever found it before, notwithstanding the same charge of powder had been made use of in the two preceding experiments; and in both these experiments the piece was loaded with a bullet, which one would naturally imagine, by confining the flame, and prolonging the time of its action, would heat the barrel much more than when it was fired with powder alone. I was convinced that I could not be mistaken in the fact; for it had been my constant practice to take hold of the piece to wipe it out as soon as an experiment was finished, and I never before had found any inconvenience from the heat in holding it. But in order to put the matter beyond all doubt, after letting the barrel cool down to the proper temperature, I repeated the experiment twice with the same charge of powder and a bullet; and in both these trials the heat of the piece was evidently much less than what it was in the experiment above mentioned. Being much struck with this accidental discovery of the great degree of heat that pieces acquire when they are fired with powder without any bullet, and being desirous of finding out whether it is a circumstance that obtains universally, I was very attentive to the heat of the barrel after each of the succeeding experiments; and I constantly found the heat sensibly greater when the piece was fired with powder only, than when the same charge was made to impel one or more bullets.”

To account for this, our author supposes, that very little of the heat acquired in firing a piece of ordnance comes from the powder; for the time that it continues in the piece, perhaps not exceeding the 200th part of a second, is so small, that were the flame *four hundred* times, instead of *four* times, as Mr Robins supposes, hotter than red hot iron, it is by far too short to communicate a sensible degree of heat to one of our large pieces of cannon. Besides, if the heat of the flame was sufficient to communicate such a degree of heat to the gun, it must undoubtedly be capable of burning up all combustible bodies that come in its way, and of melting lead-shot when such were used; but instead of this, we frequently see the finest paper discharged from the mouth of a gun without being inflamed, after it has sustained the action of the fire through the whole length of the bore; and the smallest lead-shot is discharged without being melted. The objection drawn from the heat of bullets taken up immediately after being discharged from fire-arms does not hold; for bullets discharged from air-guns and even cross-bows are likewise found hot, especially when they happen to strike—

Gunpow-
der.

Gunpow-
der.

strike any hard body, and are much flattened. If a musket ball be discharged into water, or against any very soft body, it will not be sensibly heated; but if it hits a plate of iron or any other body which it cannot penetrate, it will be broken in pieces by the blow, and the dispersed parts will be found in a state little short of actual fusion. Hence our author concludes, that bullets are not heated by the flame, but by percussion. Another objection is, that the vents of brass guns are frequently enlarged to such a degree by repeatedly firing them, that the piece becomes useless. But this proves only that brass is easily corroded by the flame of gunpowder; which indeed is the case with iron also. We cannot suppose that in either case any real solution takes place; on the contrary, it is very evident that it does not: for when the vents of fire-arms are lined with gold, they will remain without enlargement for any length of time, though it is well known that gold is much more easily melted than iron. As the heat communicated to bullets, therefore, is not to be ascribed to the flame but to percussion, so the heat acquired by guns is to be attributed, in our author's opinion, to the motion and friction of the internal parts of the metal among themselves by the violent action of the flame upon the inside of the bore. To generate heat, the action of the powder must be not only sufficient to strain the metal, and produce a motion in its parts, but this effect must be extremely rapid; and the effect will be much augmented if the exertion of the force and the duration of its action are momentaneous: for in that case the fibres of the metal that are violently stretched will return with their full force and velocity, and the swift vibratory motion and attrition above mentioned will be produced. Now the effort of any given charge of powder upon the gun is very nearly the same whether it be fired with a bullet or without; but the velocity with which the generated elastic fluid makes its escape, is much greater when the powder is fired alone than when it is made to impel one or more bullets; the heat ought therefore to be much greater in the former than in the latter case, as has been found by experiment. "But to make this matter still plainer, (says our author), we will suppose any given quantity of powder to be confined in a space that is just capable of containing it, and that in this situation it is set on fire. Let us suppose this space to be the chamber of a piece of ordnance, and that a bullet or any other solid body is so firmly fixed in the bore, immediately upon the charge, that the whole effort of the powder shall not be able to remove it; as the powder goes on to be inflamed, and the elastic fluid to be generated, the pressure upon the inside of the chamber will be increased, till at length all the powder being burnt, the strain upon the metal will be at its greatest height, and in this situation things will remain; the cohesion or elasticity of the particles of metal counterbalancing the pressure of the fluid.—Under these circumstances very little heat would be generated; for the continued effort of the elastic fluid would approach to the nature of the pressure of a weight; and that concussion, vibration, and friction among the particles of the metal, which in the collision of elastic bodies is the cause of the heat produced, would scarcely take effect. But instead of being firmly fixed in its place, let the bullet

now be moveable, but let it give way with great difficulty, and by slow degrees. In this case the elastic fluid will be generated as before, and will exert its whole force upon the chamber of the piece; but as the bullet gives way to the pressure, and moves on in the bore, the fluid will expand itself and grow weaker, and the particles of the metal will gradually return to their former situations; but the velocity with which the metal restores itself being but small, the vibration that remains in the metal after the elastic fluid has made its escape will be very languid, as will the heat be which is generated by it. But if, instead of giving way with so much difficulty, the bullet is made lighter, so as to afford but little resistance to the elastic fluid in making its escape, or if it is fired without any bullet at all; then, there being little or nothing to oppose the passage of the flame through the bore, it will expand itself with an amazing velocity, and its action upon the gun will cease almost in an instant; the strained metal will restore itself with a very rapid motion, and a sharp vibration will ensue, by which the piece will be much heated."

This reasoning of Mr Thomson's, however, seems not to be very well founded. In the first place, we are by no means certain that heat is produced by the motion or vibration of the particles of a solid body among each other. On the contrary, even in the hottest bodies we cannot be made sensible of vibration existing among their particles, while certain sounds will cause the most solid substances vibrate perceptibly, and yet without producing any heat.—From this as well as innumerable other experiments, it is probable, that heat consists in the emission of a certain subtle fluid from the heated body, which is every moment replaced from the atmosphere, or from some other source. Hence the more air that has access to any burning body, the hotter it will become, and the more will any other that is in its vicinity be heated. This is evident from the contrivance of Argand's lamp, which is neither more nor less than the admission of a larger quantity of air to the same quantity of flame. The case is the same with the firing of gunpowder, when a bullet is put into the piece, the access of the air is much more effectually prevented than when only a simple wadding is made use of. In consequence of this, no sooner is the powder fired without a bullet, than the external air rushes down the bore, mingles with the flame, and vehemently augments the heat, as well as the absolute force of the explosion. It is true, that without the external air, the nitre in the gunpowder itself produces as much air as to inflame it very violently; but this does not prove that it could not be inflamed still more by the admission of more air. Besides, when the external air is thus admitted, the flame itself is agitated by its admission, and driven against the sides of the piece with a force superior to what it has by the mere expansive pressure; whence the heat must also be considerably augmented, in the same manner that the heat of any other body will be by the having flame blown against it, instead of being blown away from it, or suffered to burn quietly by its side. Thus, without any recourse to an unknown and conjectural vibration among the particles of a solid metal, we may account for the augmented heat of a piece charged only with powder, and likewise in some measure for the prodigious

Gunpow-
der.

Gunpow-
der.

gious force of gunpowder, aurum fulminans, and pulvis fulminans, when fired in the open air, compared with what they have when exploded in close vessels.—The force of gunpowder is manifestly augmented in close vessels, as has been already said, by being rammed down or compressed together: but this arises from another cause, namely, that a greater quantity of flame is compressed into the same space than when the powder is not rammed; and this compression of the flame is in proportion to the compression of the powder in the chamber of the piece. But in this case the flame is probably less powerful than in the former, though the *quantity* inclosed in a small space may probably make up for the quality. Mr Thomson's experiments on the increased force of gunpowder by compression are as follow:—Having put a charge of 218 grains of powder, inclosed in a cartridge of very fine paper, gently into the bore of the piece, the velocity of the bullets, at a mean of four experiments, was at the rate of 1225 feet in a second; but in a medium of three experiments, when the same quantity of powder was rammed down by five or six strokes of the ramrod, the velocity was 1329 feet in a second. “Now (says he) the total force or pressure exerted by the charge upon the bullet, is as the square of its velocity; and 1329² is to 1225² as 1,776 is to 1; or nearly as 6 is to 5: and in that proportion was the force of the given charge of powder increased by being rammed.—When, instead of ramming the powder, or pressing it gently together in the bore, it is put into a space larger than it is capable of filling, the force of the charge is thereby very sensibly lessened, as Mr Robins and others have found by repeated trials. In my 30th experiment, the charge, consisting of no more than 165 grains of powder, was made to occupy 3.2 inches of the bore, instead of 1.45 inches, which space it just filled. When it was gently pushed into its place without being rammed, the consequence was, that the velocity of the bullet, instead of being 1100 feet or upwards in a second, was only at the rate of 914 feet, and the recoil was lessened in proportion.—Hence we may draw this practical inference, that the powder with which a piece of ordnance or a fire-arm is charged, ought always to be pressed together in the bore; and if it is rammed to a certain degree, the velocity of the bullet will be still farther increased. It is well known that the recoil of a musket is greater when its charge is rammed than when it is not; and there cannot be a stronger proof that ramming increases the force of powder.”

To recover damaged GUNPOWDER. The method of the powder-merchants is, to put part of the powder on a sail cloth, to which they add an equal weight of what is really good; and with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy: then they beat it fine, scarce it, and to every pound of powder add an ounce, an ounce and a half, or two ounces, according as it is decayed, of melted salt-petre. Afterwards, these ingredients are to be moistened and mixed well, so that nothing can be discerned in the composition, which may be known by cutting the mass; and then they granulate it as aforesaid. In case the powder be in

Vol. VIII. Part I.

a manner quite spoiled, the only way is to extract the saltpetre with water according to the usual manner, by boiling, filtrating, evaporating, and crystallizing; and then with fresh sulphur and charcoal to make it up anew again.

In regard to the medical virtues of gunpowder, Boerhaave informs us, that the flame of it affords a very healthy fume in the height of the plague, because the explosive acid vapour of nitre and sulphur corrects the air; and that the same vapour, if received in a small close pent-up place, kills insects.

It is enacted by 5 and 11 of Geo. I. and 5 Geo. II. c. 20. that gunpowder be carried to any place in a covered carriage; the barrels being close-jointed; or in cases and bags of leather, &c. And persons keeping more than 200 pounds weight of gunpowder at one time, within the cities of London and Westminster, or the suburbs, &c. are liable to forfeitures if it be not removed; and justices of peace may issue warrants to search for, seize, and remove the same.

GUN-Shot Wounds. See SURGERY.

GUN-Smith, a maker of small fire-arms, as muskets, fowling-pieces, pistols, &c.

GUN-Smithery, the business of a gun-smith, or the art of making fire-arms of the smaller sort, as muskets, fowling-pieces, pistols, &c.

The principal part of these instruments is the barrel, which ought to have the following properties. 1. Lightness, that it may incommode the person who carries it as little as possible. 2. Sufficient strength and other properties requisite to prevent its bursting by a discharge. 3. It ought to be constructed in such a manner as not to recoil with violence. And, 4. It ought to be of sufficient length to carry the shot to as great a distance as the force of the powder employed is capable of doing.

The manufacture of fire-arms is now carried to such a degree of perfection by different European nations, that it may perhaps be justly doubted whether any farther improvement in the requisites just mentioned can be made. For the materials, the softest iron that can be procured is to be made use of. The best in this country are formed of *stubs*, as they are called, or old horse-shoe-nails; which are procured by the gun-smiths from farriers, and from poor people who subsist by picking them up on the great roads leading to London. These are sold at about 10s. per cwt. and 28 pounds are requisite to form a single musket barrel. The method of manufacturing them from this material is as follows: A hoop of about an inch broad, and six or seven inches diameter, is placed in a perpendicular situation, and the stubs, previously well cleaned, piled up in it with their heads outermost on each side, till the hoop is quite filled and wedged tight with them. The whole then resembles a rough circular cake of iron; which being heated to a white heat, and then strongly hammered, coalesces into one solid lump. The hoop is now removed, and the heatings and hammerings repeated till the iron is rendered very tough and close in the grain; when it is drawn out into pieces of about 24 inches in length, half an inch or more in breadth, and half an inch in thickness.

Four of these pieces are employed for one barrel; but in the ordinary way a single bar of the best soft iron is employed. The workmen begin with hammering out this into the form of a flat ruler, having its

G g

length

Gun-
Smithery.

Gun-
Smithery.

length and breadth proportioned to the dimensions of the intended barrel. By repeated heating and hammering this plate is turned round a tempered iron rod called a *mandril*, the diameter of which is considerably smaller than the intended bore of the barrel. One of the edges of the plate being laid over the other about half an inch, the whole is heated and welded by two or three inches at a time, hammering it briskly, but with moderate strokes, upon an anvil which has a number of semicircular furrows in it, adapted to barrels of different sizes. Every time the barrel is withdrawn from the fire, the workman strikes it gently against the anvil once or twice in an horizontal direction. By this operation the particles of the metal are more perfectly consolidated, and every appearance of a seam in the barrel is obliterated. The mandril being then again introduced into the cavity of the barrel, the latter is very strongly hammered upon it in one of the semicircular hollows of the anvil, by small portions at a time; the heatings and hammerings being repeated until the whole barrel has undergone the operation, and its parts rendered as perfectly continuous as if they had been formed out of a solid piece. To effect this completely, three welding heats are necessary when the very best iron is made use of, and a greater number for the coarser kinds. The French workmen imagine, that by giving the barrel, while in the fire, slight horizontal strokes with the hammer, so as to communicate a vibratory motion to the iron, those particles are thrown off which are in a state of fusion and cannot easily be converted into malleable iron: but considering the great number of operations already described which the metal has undergone, we can scarce suppose this to be of much consequence.

The next operation in forming the barrels is the boring of them, which is done in the following manner: Two beams of oak, each about six inches in diameter, and six or seven feet long, are placed horizontally and parallel to one another; having each of their extremities mortised upon a strong upright piece about three feet high, and firmly fixed. A space of three or four inches is left between the horizontal pieces, in which a piece of wood is made to slide by having at either end a tenon let into a groove which runs on the inside of each beam throughout its whole length. Through this sliding piece a strong pin or bolt of iron is driven or screwed in a perpendicular direction, having at its upper end a round hole large enough to admit the breach of the barrel, which is secured in it by means of a piece of iron that serves as a wedge, and a vertical screw passing through the upper part of the hole. A chain is fastened to a staple in one side of the sliding piece which runs between the two horizontal beams; and passing over a pulley at one end of the machine, has a weight hooked on to it. An upright piece of timber is fixed above this pulley and between the ends of the beams, having its upper end perforated by the axis of an iron crank furnished with a square socket; the other axis being supported by the wall, or by a strong post, and loaded with a heavy wheel of cast iron to give it force. The axes of this crank are in a line with the hole in the bolt already mentioned.—The borer being then fixed into the socket of the crank, has its other end, previously well oiled, introduced into the barrel, whose breech part is made fast in the hole

of the bolt: the chain is then carried over the pulley, and the weight hooked on; the crank being then turned with the hand, the barrel advances as the borer cuts its way, till it has passed through the whole length.—The boring bit consists of an iron rod somewhat longer than the barrel, one end of which fits the socket of the crank; the other is adapted to a cylindrical piece of tempered steel about an inch and a half in length, having its surface cut after the manner of a perpetual screw, with five or six threads, the obliquity of which is very small. The breadth of the furrows is the same with that of the threads, and their depth sufficient to let the metal cut by the threads pass through them easily. Thus the bit gets a very strong hold of the metal; and the threads, being sharp at the edges, scoop out and remove all the inequalities and roughness from the inside of the barrel, and render the cavity smooth and equal throughout. A number of bits, each a little larger than the former, are afterwards successively passed through the barrel in the same way, until the bore has acquired the magnitude intended. By this operation the barrel is very much heated, especially the first time the borer is passed through it, by which means it is apt to warp. To prevent this in some measure, the barrel is covered with a cloth kept constantly wetted, which not only preserves the barrel from an excess of heat, but likewise preserves the temper of the bit from being destroyed. The borer itself must also be withdrawn from time to time; both to clean it from the shavings of the metal and to oil it, or repair any damages it may have sustained. Every time a fresh bit has been passed through the barrel, the latter must be carefully examined, to see if it has warped; and likewise if there are any spots, by the workmen called *blacks*, on its inside. When warped, it must be straightened on the anvil; for which a few slight strokes on the convex parts will be sufficient; and this is termed *setting up* the barrel. When black spots are perceived, the corresponding part on the outside must be marked, and driven in by gentle strokes with the hammer, when they will be completely removed by passing the borer another time through the piece.

The equality of the bore is of the utmost consequence to the perfection of a barrel; insomuch that the greatest possible accuracy in every other respect will not make amends for any deficiency in this respect. The method used by gunsmiths to ascertain this is by a cylindrical plug of tempered steel highly polished, about an inch in length, and fitting the bore exactly. This is screwed upon the end of an iron rod, and introduced into the cavity of the barrel, where it is moved backwards and forwards; and the places where it passes with difficulty being marked, the boring bit is repeatedly passed until it moves with equal ease through every part. Any person who wishes to know the merit of his piece in this respect, may do it with tolerable accuracy by means of a plug of lead cast on a rod of iron; or even by a musket ball filed exactly to the bore, and pushed through the barrel by a ramrod; taking care, however, not to use much force lest the ball be flattened, and its passage thus rendered difficult.

The last step towards the perfection of the inside of the barrel is termed *fine-boring*; by which is meant the smoothing it in such a manner as to remove all marks and inequalities left by the borer. The fine-borer resembles

Gun-
Smithery.

Gun-
Smithery.

sembles the other in its general construction; but instead of the piece of steel cut in form of a screw which belongs to that, it is furnished with a square broach 10 or 12 inches long, highly polished, and very sharp, by which means it cuts the metal very smoothly. It is found to answer the purpose best when only two of its edges are allowed to work; the other two are covered with slips of oiled paper, one or more additional slips being put on each time that the instrument is passed through the barrel. The fine-borer is frequently passed through, from the muzzle to the breech, and from the breech to the muzzle, until the whole inside presents a perfectly equal and polished surface; the barrel being likewise examined and set up, if requisite, after each time. It is absolutely necessary that this instrument should be perfectly true, and not in the least cast or warped in the tempering.

Besides the operations above described, another, called *polishing*, is usually performed on gun-barrels, though it is doubtful whether this last be attended with any good effect or not. It is performed by a cylinder of lead, five or six inches long, cast upon a rod of iron, and filed exactly to the bore. The lead being then covered with very fine emery and oil, is wrought backwards and forwards through the whole length of the barrel until the inside has acquired the requisite degree of polish. The disadvantages of this operation are, that it is scarce possible to perform it without pressing more upon one part than another, and thus producing some degree of inequality on the inside, which is of the very worst consequence to fire-arms. The polish thus given is likewise very perishable; so that the fine-boring may justly be considered as the last operation necessary for the inside of a barrel; and it is then proper to give the external form and proportions by means of a file. For this purpose, four faces are first formed upon it, then eight, then 16; and so on till it be quite round, excepting the part next the breech, called the *reinforced part*, which is always left of an octagonal form. It being absolutely necessary that the barrel should be equally thick on every side, gunsmiths employ, for accomplishing this purpose, a particular tool named a *compass*. This consists of an iron rod bent in such a manner as to form two parallel branches about an inch distant from one another. One of these branches is introduced into the barrel, and kept closely applied to the side, by means of one or more springs with which it is furnished: the other descends parallel to this on the outside, and has several screws passing through it with their points directed to the barrel. By screwing these until their points touch the surface of the barrel, and then turning the instrument round within the bore, we perceive where the metal is too thick, and how much it must be reduced, in order to render every part perfectly equal throughout its circumference. It may be made long enough to reach the whole length of the barrel, though it will be more convenient to have it only half as much, and to introduce it first at one end and then at the other. Instead of rounding the barrel by means of a file and compass, however, some people do so by turning it in a lathe; which is no doubt more expeditious, though neither so certain nor exact. A spindle as long as a gun-barrel cannot, without great difficulty, be prevented from springing considerably under the tool employed to reduce or smooth it in turn-

Gun-
Smithery.

ing; whence it is found, that by this operation barrels are more frequently warped than by all the borings they undergo; and there is now this farther inconvenience, that they cannot be set up as formerly, without danger of destroying them entirely.

The barrels being thus bored and formed externally, it is customary with the gunsmiths in France to solder on the loops and aim before they breech the barrel. The English, however, do not restrict themselves in this manner: for as soft solder is sufficient for fastening on these, they never use any other; while the French, who use hard solder, must of consequence employ a great heat. Thus the inside is roughened sometimes so considerably, that it is necessary to repeat the fine boring; which could not be done without injuring the threads of the screw formed for the breech, if the barrel were prepared for the latter without soldering on the former.

The first tool employed in forming the breech-screw is a plug of tempered steel, somewhat conical, with the threads of a male screw upon its surface, and by the workman termed a *screw tap*. This being introduced into the barrel, and worked from left to right and back again, until it has marked out the four first threads of the screw, another less conical tap is introduced; and when this has carried the impression of the screw as far as it is intended to go, a third one, nearly cylindrical, is made use of, scarcely differing from the plug of the breech intended to fill the screw thus formed in the barrel. The plug itself has its screw formed by means of a screw-plate of tempered steel, with several female screws, corresponding with the taps employed for forming that in the barrel. Seven or eight threads are a sufficient length for a plug: they ought to be neat and sharp, so as completely to fill the turns made in the barrel by the tap. The breech-plug is then to be case-hardened, or to have its surface converted into steel, by covering it with shavings of horn, or the parings of the hoofs of horses, and keeping it for some time red hot; after which it is plunged in cold water.

The only thing now requisite for completing the barrels is to give them a proper colour; as a preparation for which their outside is first to be neatly polished with oil and emery. This being done, it was formerly the custom to give such a degree of heat as would make them blue throughout; but as this cannot be effected without a partial calcination of the surface, which of consequence affects the inside also, the blue colour has been for some time disused, and a brown one substituted in its place. To give this colour, the pieces are first rubbed over with aquafortis or spirit of salt diluted with water; after which they are laid by till a complete coat of rust is formed upon them: a little oil is then applied; and the surface being rubbed dry, is polished by means of a hard brush and bees-wax.

Thus the common musket-barrels for the purposes especially of sportmanship are made; but there are some other methods of manufacture, by which the barrels are made to differ in some respects from those just described, and are thought to be considerably improved. One kind of these are called *twisted* barrels; and by the English workmen are formed out of the plates made of *stubs* formerly described. Four of these, of the size already mentioned, are requisite to make one barrel. One of them heated red hot for five or six inches is

Gun-
Smithery.

turned like a cork-screw by means of the hammer and anvil; the remaining parts being treated successively in the same manner until the whole is turned into a spiral, forming a tube the diameter of which corresponds with the bore of the intended barrel. Four are generally sufficient to form a barrel of the ordinary length, *i. e.* from 32 to 38 inches; and the two which form the breech or strongest part, called the *reinforced part*, are considerably thicker than those which form the muzzle or fore part of the barrel. One of these tubes is then welded to a part of an old barrel to serve as an handle; after which the turns of the spiral are united by heating the tube two or three inches at a time to a bright white heat, and striking the end of it several times against the anvil in a horizontal direction with considerable strength, which is called *jumping the barrel*; and the heats given for this purpose are called *jumping heats*. The next step is to introduce a mandril into the cavity, and to hammer the heated portion lightly in order to flatten the ridges or burrs raised by the jumping at the place where the spirals are joined. As soon as one piece is jumped throughout its whole length, another is welded to it, and treated in the same manner, until the four pieces are united, when the part of the old barrel is cut off, as being no longer of any use. The welding is repeated three times at least, and is performed exactly in the same manner as directed for plain barrels; and the piece may afterwards be finished according to the directions already given.

The operation for the French twisted barrels is very different from that just mentioned, and much more exceptionable. It consists in heating the barrel by a few inches at a time to a strong red heat; one end is then screwed into a vice, and a square piece of iron with an handle like an augre is introduced into the other. By means of these the fibres of the heated portion are twisted into a spiral direction, which is supposed to resist the effort of the inflamed powder better than the other. To render this operation complete, however, it must be observed, that when once the several portions of the barrel have been twisted, the subsequent heats ought not to be very great, or the grain of the metal will regain its former state, and the barrel be no better for the twisting than before. To twist a barrel in this manner, also, it will be necessary to forge it at least half a foot longer than it is intended to be, that a sufficient length may be kept cold at each end to give a sufficient purchase to the vice and twisting instrument; and these portions must afterwards be cut off before the barrel is bored, or two pieces of an old barrel may be welded to the muzzle and breech of that which is to be twisted, and cut off when the operation is over. These pieces may also be made stronger than usual to resist the force of the vice and twisting instrument; and in order to give the latter a firmer hold, the cavity of the muzzle may be made of a square form. The English workmen are unanimously of opinion that this method of twisting is really injurious to the barrel, by straining the fibres of the metal. At any rate, from the injudicious methods followed by the French artists, the greatest part of their barrels, said to be twisted, are not so in reality; there being at least six or seven inches at the muzzle, and seven or eight at the breech, which are not affected by the operation.

The French *ribbon-barrels* have a great resemblance

to the English twisted ones; but the process for making them is much more operose, though it seems not to possess any real advantage over that used by the English artists. A plate of iron, about the twelfth part of an inch in thickness, is turned round a mandril, and welded its whole length in the same manner as a plain barrel. Upon this slight barrel, which is called the *lining*, a plate of iron about an inch in breadth, and bevelled off at the edges, is by means of successive heats rolled in a spiral direction; after which it is termed the *ribbon*, and must have a thickness corresponding with that part of the barrel which it is to form. As it would, however, be difficult to form a ribbon of sufficient length for the whole barrel, it is made in several pieces; and when one piece is rolled on, another is welded to its end, and the operation continued until the lining be entirely covered. The edges are so much bevelled, that the one folds over the other about a quarter of an inch. After the ribbon is all rolled on, the barrel must be heated by two or three inches at a time, and the turns of the spiral united to each other and to the lining by being welded in the same manner as the twisted barrel; though, from what has been said of the construction of these barrels, it is plain that the operation of *jumping* cannot be admitted in them. The barrel is afterwards bored in such a manner that almost the whole of the lining is cut out, and scarce any thing left but the ribbon with which the lining was covered.

The superiority of twisted and ribbon barrels over the plain kind gave occasion to a third sort named *wired barrels*. These were invented by an ingenious workman at Paris named *Barrois*; whose method was as follows: Upon a thin barrel, filed and dressed as usual, he rolled, as close as possible, and in a spiral direction, a tempered iron wire about the thickness of a crow-quill, the first layer covering only the reinforced part. The turns of the wire were soldered to each other and to the barrel with a composition which he kept a secret. The wired part was then filed smooth and bright, but not so much as to weaken it; a second layer of wire was applied over the first, extending two-thirds of the length of the barrel; and this being smoothed and brightened like the first, a third layer was applied, which covered the two former and reached quite to the muzzle.

The barrels made after this manner are supposed to be much superior to others, though the supposition seems not to be well founded. It is certain that wire is not preferable to other iron as a material for gun-barrels; and the solder used by M. Barrois in a quantity nearly equal to the wire itself, must be accounted a defect as far as it was used; for no metal has yet been found equal to iron for the purposes of gunsmiths: so that by the use of so much of this solder in the composition of the barrel, it must be undoubtedly weaker than if it had been all made of iron. We are not to suppose the wire absolutely free from flaws, and even though it were, there will always be small cavities between its turns, which the solder cannot fill completely. Besides, as the operation of wiring was performed by M. Barrois upon a barrel that had been previously bored and dressed within, the repeated heats to which it was afterwards subjected in soldering, if they did not cause it warp, at least rendered it so

Gun-
Smithery.

rough

Gun-
Smithery.

rough that it was necessary to fine-bore it afterwards. The only advantage therefore which these barrels were found to possess was their beautiful appearance; which was greatly overbalanced by the circumstances just mentioned, as well as by the extravagant prices at which they were sold; a single barrel being sold at 5*l*. and a double one at twice that sum; whence the sale of them never answered the expectation of the inventor, and after his death no body thought of making them.

The Spanish barrels have long been held in great estimation, both on account of their being formed of better iron than those of other countries, and likewise from an opinion of their being more perfectly forged and bored. Those made at Madrid are the best, and even of these such as have been made by former gunsmiths are in the greatest estimation. The most celebrated Spanish gunsmiths were Nicolas Biz, who lived in the beginning of the present century, and died in 1724; and the barrels fabricated by him in the former part of his life are held in greatest estimation. Those of his contemporaries, Juan Belán and Juan Fernandez, are no less valued; all of their barrels selling in France at 1000 livres, or 45*l*. 15*s*. sterling. The successors of these great artists were Diego Esquibal, Alonzo Martinez, Agostin Ortiz, Matthias Vaera, Luis Santos, Juan Santos, Francisco Garcia, Francisco Targarone, Joseph Cano, and N. Zelaya. The most celebrated now in life are Francisco Loper, Salvador Cenarro, Miguel Zeguarra, Isidoro Soler, and Juan de Soto. The three first are gunsmiths to the king; and the barrels made by all of them sell for 13*l*. sterling. Almost all the Madrid barrels are composed of the old shoes of horses and mules, which are collected for the purpose. They are manufactured first by welding longitudinally, and then being joined together in four or five pieces like the English barrels made from stubs, as already mentioned. In this, and indeed all other operations for making gun-barrels, an immense waste of the iron takes place; but that of the Spanish iron is by far the greatest, a mass of 40 or 45 pounds being required to make one barrel, which when rough from the forge weighs only six or seven pounds; so that from 30 to 38 pounds are lost in the hammerings. It may perhaps, however, be doubted, whether the iron be really *purified* by this waste; for it is certain, that by long continued working in the fire it may be rendered totally useless and destroyed; neither can we be assured that the other advantages pretended to result from their method of manufacture are of any consequence. The Spanish artists likewise value themselves on giving the inside of their barrels a very high polish; but the advantage of this, as has already been observed, is extremely dubious. The only thing requisite in a gun-barrel is that it do not *lead*; that is, that the mark of the bullet be not perceived on the inside after it has been discharged, by some of the lead rubbed off as it passes through. In the opinion of very good judges, therefore, it is better to take a barrel immediately after it has undergone the operation of fine-boring than to give it any higher polish; and in support of this opinion, M. de Marolles, an author of great reputation, informs us, that he has seen a barrel rough from the borer throw a charge of shot deeper into a quire of paper than one which was highly polished

Gun-
Smithery.

within, though the length, bore, and charge, were the same in both.

As the Spanish iron is universally allowed to be excellent, it has not been unreasonably supposed that the superiority of the barrels manufactured in that kingdom is owing more to the goodness of the materials than to the skill of the workmen. It must be observed, however, that instead of making the plates overlap a *little* in the place where they join, they give one of them a complete turn; so that every Spanish barrel may be said to be double throughout its whole length. The different portions of the iron are also forged in such a manner, that the grain of the iron is disposed in a spiral manner; whence it has the same effect with a ribbon or twisted barrel. The outside is finished by turning them in a lathe; whence probably they are always less elegantly wrought than the French and English pieces. The great value put upon them is also thought to be more owing to fancy than to any real good qualities they possess. Formerly they were made from three to three feet and a half long; their bore being such as to admit a bullet from 22 to 24 in the pound; and their weight from three to three pounds and an half. The reinforced part extends two-fifths of the length; and at 10 or 12 inches from the breech is placed a *fight*, such as is usually put upon rifle-barrels or those intended only for ball. According to Espinas, arquebuss-bearer to Philip IV. the weight of a Spanish barrel ought to be four pounds and an half when their length is 42 inches; but both weight and length are now much reduced, they seldom exceeding the dimension already mentioned. Next to the barrels made at Madrid, the most esteemed are those of Bustindui and St Olabe at Placentia in Biscay; and of Jeun and Clement Padwesteva, Eudal Pous, and Martin Marechal, at Barcelona; the usual price of them being about 3*l*. 10*s*. sterling.

Having now described the method of forging barrels, we shall next proceed to give an account of those imperfections to which they are sometimes liable, and which render them apt to burst or recoil with violence. The principal of these are the *chink*, *crack*, and *flaw*. The first is a small rent in the direction of the length of the barrel; the second across it; and the third is a kind of scale or small plate adhering to the barrel by a narrow base, from which it spreads out like the head of a nail from its shank, and when separated leaves a pit or hollow in the metal. The chink or flaw are of much worse consequence than the crack in fire-arms, the force of the powder being exerted more upon the circumference than the length of the barrel. The flaw is much more frequent than the chink, the latter scarce ever occurring but in plain barrels formed out of a single plate of iron, and then only when the metal is deficient in quality. When flaws happen on the outside, they are of no great consequence; but in the inside they are apt to lodge moisture and foulness which corrode the iron, and thus the cavity enlarges continually till the piece bursts. This accident, however, may arise from many other causes besides the defect of the barrel itself. The best pieces will burst when the ball is not sufficiently rammed home, so that a space is left between it and the powder. A very small windage or passage for the inflamed powder between the sides of the barrel and ball will be sufficient to prevent the

Gun-
Smithery.

the accident; but if the ball has been forcibly driven down with an iron ramrod, so as to fill up the cavity of the barrel very exactly, the piece will almost certainly burst, if only a very small space be left between it and the powder; and the greater the space is, the more certainly does the event take place. Of this Mr Robins gives a remarkable instance, accounting at the same time for the phenomenon. "A moderate charge of powder (says he), when it has expanded itself through the vacant space and reaches the ball, will, by the velocity each part has acquired, accumulate itself behind the ball, and will thereby be condensed prodigiously: whence, if the barrel be not of an extraordinary strength in that part, it must infallibly burst. The truth of this I have experienced in a very good Tower musket forged of very tough iron: for charging it with 12 pennyweight of powder, and placing the ball loosely 16 inches from the breech; on the firing of it, the part of the barrel just behind the bullet was swelled out to double its diameter like a blown bladder, and two large pieces of two inches in length were burst out of it." A piece will frequently burst from having its mouth stopped up with earth or snow; which accident sometimes happens to sportsmen in leaping a ditch, in which they have assisted themselves with their fowling-piece, putting the mouth of it to the ground; and when this does not happen, it is only to be accounted for from the stoppage being extremely slight. For the same reason a musket will certainly burst if it be fired with the muzzle immersed only a very little way in water. It will also burst from an overcharge; but when such an accident happens in other circumstances, it is most probably to be attributed to a defect in the workmanship, or in the iron itself. These defects are principally an imperfection in the welding, a deep flaw having taken place, or an inequality in the bore; which last is the most common of any, especially in the low-priced barrels. The reason of a barrel's bursting from an inequality in the bore is, that the elastic fluid, set loose by the inflammation of the powder, and endeavouring to expand itself in every direction, being repelled by the stronger parts, acts with additional force against the weaker ones, and frequently bursts through them, which it would not have done had the sides been equally thick and strong throughout. With regard to defects arising from the bad quality of the iron, it is impossible to say any thing certain. As the choice of the materials depends entirely on the gunsmith, the only way to be assured of having a barrel made of proper metal is to purchase it from an artist of known reputation, and to give a considerable price for the piece.

The recoil of a piece becomes an object of importance only when it is very great; for every piece recoils in some degree when it is discharged. The most frequent cause of an excessive recoil is an inequality in the bore of the barrel; and by this it will be occasioned even when the inequality is too small to be perceived by the eye. The explanation of this upon mechanical principles indeed is not very easy: for as it is there an invariable law, that action and reaction are equal to one another, we should be apt to suppose that every time a piece is discharged it should recoil with the whole difference between the velocity of the bullet and that of the inflamed powder. But were this the

case, no man could fire a musket without being destroyed; for the bullet flies out only with a velocity of 1700 feet in a second, or not much more, while that of the powder, as calculated by Mr Robins, is not less than 7000 feet in the same space. But was the recoil to be made with the difference of these velocities, or with one half of it, it is plain that no man could bear it. The same thing therefore must take place in the recoil of a musket which Dr Priestley observed in his experiments on the explosion of inflammable and dephlogisticated air, *viz.* that the force is exerted much more upon the part farthest from that where the inflammation begins than upon that next to it. At any rate, however, the strength of the recoil will always be found proportionable to the weight of the piece; that is, the lighter the piece is, the greater the recoil, and *vice versa*. The recoil may be increased by any thing which retards the passage of the shot; whence it is also augmented by the foulness of the barrel by repeated firing. M. de Marolles informs us also, that a piece will recoil, if, from the breech-plug being made too short, some turns of the screw remain empty; as in these a part of the powder is lodged which forms an obstacle to the explosion; though in what manner this takes place is not very apparent, as, though the powder lodged there might contribute little or nothing to the force of the explosion, it can scarce be shown to stand in the way of it. The same author likewise informs us, that a barrel mounted upon a very straight stock will recoil more than upon one that is considerably bent. Sometimes also a fowling-piece will recoil from the sportsman applying it improperly to his shoulder; though this last circumstance seems likewise inexplicable. It is most probable therefore that the supposed *greater* recoil taken notice of in this case, arises only from the usual recoil being more sensibly felt in one position than another.

The cause to which too great a recoil in muskets has been usually attributed, is the placing of the touch-hole at some distance from the breech-plug; so that the powder is fired about the middle, or towards its fore-part, rather than at its base. To avoid this, some artists form a groove or channel in the breech-plug as deep as the second or third turn of the screw; the touch-hole opening into this channel, and thus firing the powder at its very lowest part. It appears, however, from a number of experiments made upon this subject by M. le Clerc gunsmith to the king of France, that it made very little difference with regard to the recoil, whether the touch-hole was close to the breech or an inch distant from it. The only circumstance to be attended to with respect to its situation therefore is, that it be not quite close to the breech-plug; as in such a case it is found to be more apt to be choaked up than when placed about a quarter of an inch from it.

The only other circumstance now to be determined with regard to musket-barrels is their proper length. Formerly it was supposed that the longer they were made, the greater would be the distance to which they carried the shot, and that without any limitation. This opinion continued to prevail till about half a century ago, when it was first proposed as a doubt whether long barrels carried farther than short ones. With regard to cannon, indeed, it had long before this time been

Gun-
Smithery.

Gun-
Smithery.

been known that they might be made too long; and Balthazar Killar, a celebrated cannon-founder in the reign of Louis XIV. was able to account for it. When asked by Monsr. Suriry de St Remy, why the culverin of Nancy, which is 22 feet long, did not carry a ball equally far with a shorter piece? he replied, that "the powder, when inflamed, ought to quit the cavity of the piece in a certain time, in order to exert its whole force upon the bullet: by a longer stay, part of the force is lost; and the same cause may produce an inequality in the shots, by giving a variation to the bullet, so as to destroy its rectilineal course, and throw it to one side or other of the mark". Mr Robins, who on this as well as every other question in gunnery has almost exhausted the subject, informs us, that "if a musket-barrel, of the common length and bore, be fired with a leaden bullet and half its weight of powder, and if the same barrel be afterwards shortened one half and fired with the same charge, the velocity of the bullet in this shortened barrel will be about one-sixth less than what it was when the barrel was entire; and if, instead of shortening the barrel, it be increased to twice its usual length, when it will be near eight feet long, the velocity of the bullet will not hereby be augmented more than one-eighth part. And the greater the length of the barrel is in proportion to the diameter of the bullet, and the smaller the quantity of powder, the more inconsiderable will these alterations of velocity be." From these considerations it appears, that the advantages gained by long barrels are by no means equivalent to the disadvantages arising from the weight and incumbrance of using them; and from a multitude of experiments it is now apparent, that every one may choose what length he pleases, without any sensible detriment to the range of his piece. The most approved lengths are from 32 to 38 inches.

An opinion has generally prevailed among sportsmen, that by some unknown manœuvre the gunsmith is able to make a piece, loaded with small shot, throw the contents so close together, that even at the distance of 40 or 50 paces the whole will be confined within the breadth of a hat. From such experiments as have been made on this subject, however, it appears, that the closeness or wideness with which a piece throws its shot is liable to innumerable variations from causes which no skill in the gunsmith can possibly reach. So variable are these causes, that there is no possibility of making the same piece throw its shot equally close twice successively. In general, however, the closer the wadding is, the better disposed the shot seems to be to fall within a small compass. The closeness of the shot therefore would seem to depend in a great measure on preventing the flame of the powder from insinuating itself among its particles: whence the following method is said to be practised with success by those who shoot for a wager at a mark with small shot; viz. to put in the shot by small quantities at a time, ramming down a little tow or thin paper over each; so as to fill the interstices of the grains, and thus prevent the flame from getting in amongst the grains and scattering them. In firing with small shot, a curious circumstance sometimes occurs, viz. that the grains, instead of being equally distributed over the space they strike, are thrown in clusters of 10, 12, 15, or more; whilst several considerable spaces are left without a

grain in them. Sometimes one-third or one half of the charge will be collected into a cluster of this kind; nay, sometimes, though much more rarely, the whole charge will be collected into one mass, so as to pierce a board near an inch thick at the distance of 40 or 45 paces. Small barrels are said to be more liable to this clustering than large ones; and M. de Marolles informs us, that this is especially the case when the barrels are new, and likewise when they are fresh-washed; though he acknowledges that it did not always happen with the barrels he employed even after they were washed. It is probable, therefore, that the closeness of the shot depends on some circumstance relative to the wadding rather than to the mechanism of the barrel.

Some pieces are composed of two or more barrels joined together; in which case the thickness of each of the barrels is somewhat less than in single-barrelled pieces. After being properly dressed, each of them is filed flat on the side where they are to join each other, so that they may fit more closely together. Two corresponding notches are then made at the muzzle and breech of each barrel; and into these are fitted two small pieces of iron to hold them more strongly together. Being then united by tinning the contiguous parts, a triangular piece of iron called the *rib* is fastened on in like manner, running the whole length on the upper side; which serves to hold them more strongly together. After this they are to be polished and coloured in the manner described for single barrels. Great care should be taken that the barrels joined in this manner should be quite equal in strength to one another, and that both should be quite upright, or of an equal thickness throughout. If any inequality takes place in the strength of the barrels, the weaker will be warped by the action of the stronger; and the warping from this cause has sometimes been so considerable as to render one of the barrels useless. To bring every part of the circumference of each barrel to an equal strength as nearly as possible, so that no part may be strained by the explosion, that side where they touch each other must be so reduced, that the partition between the two calibers may be no thicker than either barrel was at the same place before it was filed to join in this manner. Formerly the double-barrelled pieces were made with one barrel lying over the other, each barrel having a separate pan, hammer, and hammer-spring, but only one cock for both. The barrels were therefore made to turn round at the place where the breeches joined with the stock; so that as soon as one was fired off, the other could be brought into its place by pressing a spring moved by the guard with the right hand, while with the left the barrels were turned upon their common axis; and as soon as the charged barrel was thus brought into its proper situation, the spring descended into a notch and kept it firm. But this method was found to be too complicated and embarrassed, though upon the same plan three and four barrels were sometimes mounted upon one stock; but these pieces were intolerably heavy, and have no real superiority over the double-barrelled pieces which do not turn round, and which of consequence are now only made use of.

In forging barrels of all kinds, it is of considerable importance to have them made at first as near as possible

Gun-
Smithery.

Gunter. ble to the weight intended when they are finished, so that very little be taken away by the boring and filing: for as the outer surface, by having undergone the action of the hammer more immediately than any other part, is rendered the most compact and pure, we should be careful to remove as little of it as possible; and the same holds, though in a less degree, with the inside, which is to be cut with the borer. Pistol-barrels are forged in one piece, two at a time, joined by their muzzles, and are bored before they are cut asunder; by which means there is not only a saving of time and labour, but a greater certainty of the bore being the same in both.

GUNTER (Edmund), an excellent English mathematician and astronomer, was born in Hertfordshire in 1581, and studied at Westminster-school; from whence he removed to Oxford, where he took the degree of master of arts in 1606, and afterwards entered into holy orders. In 1615 he took the degree of bachelor of divinity: but being peculiarly eminent for his knowledge in the mathematics, he had two years before been chosen professor of astronomy in Gresham-college, London; where he distinguished himself by his lectures and writings. He invented a small portable quadrant; and also the famous line of proportions, which, after the inventor, is called *Gunter's scale*. He likewise published *Canon Triangulorum*; and a work intitled *Of the Sector, Cross-staff, and other Instruments*. This last was published, with an English translation of his *Canon Triangulorum*, in 4to, by Samuel Foster professor of Gresham-college. Mr Gunter died at that college in 1626.

GUNTER'S Line, a logarithmic line, usually graduated upon scales, sectors, &c.

It is also called the *line of lines* and *line of numbers*; being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically. It is usually divided into 100 parts, every tenth whereof is numbered, beginning with 1 and ending with 10: so that if the first great division, marked 1, stand for one-tenth of any integer, the next division, marked 2, will stand for two-tenths, 3, three-tenths, and so on; and the intermediate divisions will in like manner represent 100th-parts of the same integer. If each of the great divisions represent 10 integers, then will the lesser divisions stand for integers; and if the greater divisions be supposed each 100, the subdivisions will be each 10.

Use of GUNTER'S Line. 1. *To find the product of two numbers.* From 1 extend the compasses to the multiplier; and the same extent, applied the same way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compasses from 1 to 4, and that extent laid from 8 the same way will reach to 32, their product. 2. *To divide one number by another.* The extent from the divisor to unity will reach from the dividend to the quotient: thus, to divide 36 by 4, extend the compasses from 4 to 1, and the same extent will reach from 36 to 9, the quotient sought. 3. *To three given numbers to find a fourth proportional.* Suppose the numbers 6, 8, 9: extend the compasses from 6 to 8; and this extent, laid from 9 the same way, will reach to 12, the fourth proportional required. 4. *To find a mean pro-*
N^o 147.

portional between any two given numbers. Suppose 8 and 32: extend the compasses from 8, in the left-hand part of the line, to 32 in the right; then bisecting this distance, its half will reach from 8 forward, or from 32 backward, to 16, the mean proportional sought. 5. *To extract the square-root of any number.* Suppose 25: bisect the distance between 1 on the scale and the point representing 25; then the half of this distance, set off from 1, will give the point representing the root 5. In the same manner the cube root, or that of any higher power, may be found by dividing the distance on the line between 1 and the given number into as many equal parts as the index of the power expresses; then one of those parts, set from 1, will find the point representing the root required.

GUNTER'S Quadrant, one made of wood, brass, &c. containing a kind of stereographic projection of the sphere, on the plane of the equinoctial; the eye being supposed placed in one of the poles.

GUNTER'S Scale, called by navigators simply the *gunter*, is a large plain scale, generally two feet long, and about an inch and a half broad, with artificial lines delineated on it, of great use in solving questions in trigonometry, navigation, &c.

GUNWALE, or **GUNNEL**, is the uppermost wale of a ship, or that piece of timber which reaches on either side from the quarter-deck to the fore-castle, being the uppermost bend which finishes the upper works of the hull, in that part in which are put the stanchions which support the waste-trees.

GURK, an episcopal town of Carinthia in Germany, seated on the river Gurk, in E. Long. 14. 15. N. Lat. 47. 10.

GURNARD, in ichthyology. See **TRIGLA**.

GUST, a sudden and violent squall of wind, bursting from the hills upon the sea so as to endanger the shipping near the shore. These are peculiar to some coasts, as those of South Barbary and Guinea.

GUSTAVIA, in botany; a genus of the polyandria order, belonging to the monadelphia class of plants. There is no calyx; the petals very numerous; the berry multilocular; the seeds appendaged.

GUSTAVUS I. king of Sweden, son of Eric de Vasa duke of Gripsholm. Christian II. king of Denmark having made himself master of the kingdom of Sweden, confined Gustavus at Copenhagen; but he making his escape, wandered a long time in the forests, till the cruelties of the tyrant having occasioned a revolution, he was first declared governor of Sweden, and in 1513 elected king. This prince introduced Lutheranism into his dominions, which in a little time spread itself all over the kingdom. He died in 1560; having made his kingdom hereditary, which was before elective. See **SWEDEN**.

GUSTAVUS Adolphus, surnamed *the Great*, king of Sweden, was born at Stockholm in 1594, and succeeded his father Charles in 1611. He espoused the cause of the Protestants in Germany, who were oppressed and almost entirely ruined by the emperor Ferdinand. He was a great warrior, and gained many victories, of which an account is given under the article **SWEDEN**. He was at last killed in the battle of Lutzen, where his troops got the victory, and defeated two of the emperor's armies.

GUTHALUS, or **GUTTALUS**, (anc. geog.), is thought

Gutta || thought to be the *Viadrus* of Ptolemy. Now the *Oder*; which rising in Moravia, runs through Silesia, Brandenburg, and Pomerania, into the Baltic.

GUTTA, a Latin term for what in English we call drop.

GUTTA Rosacea, in medicine, denotes a red or pimpled face; a distemper which, though not always owing its original to hard drinking, is nevertheless most incident to tipplers of strong beer, wines, spirits, &c.

GUTTA Serena, a disease in which the patient, without any apparent fault in the eye, is deprived of sight. See (*Index* subjoined to) *MEDICINE*.

GUTTA, in architecture, are ornaments in the form of little cones used in the Doric cornice, or on the architrave underneath the triglyphs, representing a sort of drops or bells.

GUTTURAL, a term applied to letters or sounds pronounced or formed as it were in the throat.

GUTTY, in heraldry, a term used when any thing is charged or sprinkled with drops. In blazoning, the colour of the drops is to be named; as gutty of fable, of gules, &c.

GUY (Thomas), an eminent bookseller, founder of the hospital for sick and lame in Southwark bearing his name, was the son of Thomas Guy lighterman and coal-dealer in Horsley-down, Southwark. He was put apprentice, in 1660, to a bookseller in the porch of Mercers'-chapel; and set up trade with a stock of about 200*l.* in the house that forms the angle between Cornhill and Lombard-street. The English Bibles being at that time very badly printed, Mr Guy engaged with others in a scheme for printing them in Holland and importing them; but this being put a stop to, he contracted with the university of Oxford for their privilege of printing them, and carried on a great bible-trade for many years to a considerable advantage. Thus he began to accumulate money, and his gains rested in his hands; for being a single man, and very penurious, his expenses could not be great when it was his custom to dine on his shop-counter with no other table-covering than an old newspaper: he was moreover as little scrupulous about the style of his apparel. The bulk of his fortune, however, was acquired by purchasing seamen's tickets during queen Anne's wars, and by South-Sea stock in the memorable year 1720. To show what great events spring from trivial causes, it may be observed, that the public owe the dedication of the greatest part of his immense fortune to charitable purposes, to the indiscreet officiousness of his maid-servant in interfering with the mending of the pavement before the door. Guy had agreed to marry her; and, preparatory to his nuptials, had ordered the pavement before his door, which was in a neglected state, to be mended, as far as to a particular stone which he pointed out. The maid, while her master was out, innocently looking on the paviors at work, saw a broken place that they had not repaired, and mentioned it to them: but they told her that Mr Guy had directed them not to go so far. Well, says she, do you mend it: tell him I bid you, and I know he will not be angry. It happened, however, that the poor girl presumed too much on her influence over her careful lover, with whom a few extraordinary shillings expence turned the scale totally against her: the men obeyed; Guy was enraged to find his orders exceeded, his matrimo-

VOL. VIII. Part I.

nial scheme was renounced, and so he built hospitals in his old age. In the year 1707 he built and furnished three wards on the north side of the outer court of St Thomas's Hospital in Southwark, and gave 100*l.* to it annually for eleven years preceding the erection of his own hospital: and, some time before his death, erected the stately iron-gate, with the large houses on each side, at the expence of about 3000*l.* He was 76 years of age when he formed the design of building the hospital contiguous to that of St Thomas's, which bears his name, and lived to see it roofed in; dying in the year 1724. The charge of erecting this vast pile amounted to 18,793*l.* and he left 219,499*l.* to endow it; a much larger sum than had ever been dedicated to charitable uses in this kingdom by any one man. He erected an alms-house with a library at Tanworth in Staffordshire (the place of his mother's nativity, and for which he was representative in parliament) for 14 poor men and women; and for their pensions, as well as for the putting out poor children apprentices, bequeathed 125*l.* a-year. Lastly, he bequeathed 1000*l.* to every one who could prove themselves in any degree related to him.

GUY, a rope used to keep steady any weighty body whilst it is hoisting or lowering, particularly when the ship is shaken by a tempestuous sea.

GUY is likewise a large slack rope, extending from the head of the main-mast to the head of the fore-mast, and having two or three large blocks fastened to the middle of it. This is chiefly employed to sustain the tackle used to hoist in and out the cargo of a merchant ship, and is accordingly removed from the mast-head as soon as the vessel is laden or delivered.

Guy's Cliff, in Warwickshire, a great cliff on the west side of the Avon and the north side of Warwick, where in the Britons time was an oratory, and in that of the Saxons an hermitage, where Guy earl of Warwick, who is said to have retired to it after his fatigues by the toils and pleasures of the world, built a chapel, and cohabited with the hermit; and that from thence it had the name. This hermitage was kept up to the reign of Henry VI. when Rich. Beauchamp earl of Warwick established a chantry here, and in memory of the famous Guy erected a large statue of him in the chapel eight feet in height, and raised a roof over the adjacent springs. The chapel is in the parish of St Nicholas, in the suburbs of Warwick.

GUYON (Johanna Mary Bouriers de la Mothe), a French lady, memorable for her writings, and for her sufferings in the cause of Quietism, was descended from a noble family, and born at Montargis in 1648. She gave some extraordinary symptoms of illumination from her earliest infancy, and tried to take the veil before she was of age to dispose of herself; but her parents obliged her to marry a gentleman to whom they had promised her. She was a widow at the age of 28; when distinguishing herself in, and making many converts to, the way of contemplation and prayer known by the name of *Quietism*, complaints were made of her spiritualism, and she was confined by order of the king, and severely examined for eight months. She was discharged; but was afterwards involved in the persecution of the archbishop of Cambray, and thrown into the Bastile, where she underwent many examinations: but nothing being made out against her, she once more

H h

obtained

Guy,
Guyon.

Gwinied

II
Gymna-
sium.

obtained her liberty, and lived private to her death in 1717. She spent her latter years in mystical reveries; covering her tables, cieling, and every thing that would receive them, with the fallies of a visionary imagination. Her pious verses were collected after her death in 5 vols, intitled *Cantiques spirituels, ou d'Emblemes sur l'Amour Divin*. Her publications were, *Le moyen court et tres facile de faire Oraisons*; and *Le Cantique des Cantiques de Salomon interprete selon le sens mystique*; which were condemned by the archbishop of Paris.

GWINIAD, in ichthyology. See SALMO.

GYARUS (anc. geog.), one of the Cyclades, 12 miles in compass, lying to the east of Delos. It was a desert island, and allotted for a place of banishment by the Romans.

GYBING, the act of shifting any boom-sail from one side of the mast to the other.

In order to understand this operation more clearly, it is necessary to remark, that by a boom-sail is meant any sail whose bottom is extended by a boom, the fore-end of which is hooked to its respective mast; so as to swing occasionally on either side of the vessel, describing an arch, of which the mast will be the centre. As the wind or the course changes, it also becomes frequently necessary to change the position of the boom, together with its sail, which is accordingly shifted to the other side of the vessel as a door turns upon its hinges. The boom is pushed out by the effort of the wind upon the sail, and is restrained in a proper situation by a strong tackle communicating with the vessel's stern, and called the *sheet*. It is also confined on the fore-part by another tackle called the *guy*.

GYGÆUS (anc. geog.), called also *Colous*; a lake of Lydia, distant 40 stadia, or 5 miles, from Sardes.

GYGES (fab. hist.), a Lydian, to whom Candaules king of the country showed his wife naked. The queen was so incensed at this instance of imprudence and infirmity in her husband, that she ordered Gyges either to prepare for death himself, or to put Candaules to death. He chose the latter; and, marrying the queen, ascended the vacant throne about 718 years before the Christian era. He was the first of the Mermnadæ who reigned in Lydia. He reigned 38 years, and distinguished himself by the immense presents which he made to the oracle of Delphi (*Herod. 1. c. 8.*)—According to Plato, Gyges descended into a chasm of the earth, where he found a brazen horse, whose sides he opened, and saw within the body the carcase of a man of uncommon size, from whose finger he took a brazen ring. This ring, when he put it on his finger, rendered him invisible; and by means of its virtue he introduced himself to the queen, murdered her husband, and married her and usurped the crown of Lydia. (*Cic. Off. iii. c. 9.*)

GYMNASIARCH, in antiquity, the director of the gymnasium. He had two deputies under him; the one called *xyllarch*, who presided over the *athletæ*, and had the oversight of wrestling; the other was *gymnastes*, who had the direction of all other exercises.

GYMNASIUM, in Grecian antiquity, a place fitted for performing exercises of the body, &c.—The word is Greek formed of γυμνός, “naked;” by reason they anciently put off their clothes, to practise with the more freedom.

Gymnasia, according to Potter, were first used at

Lacedæmon, but were afterwards very common in all parts of Greece; and imitated, very much augmented, and improved, at Rome. There were three principal gymnasia at Athens; the academy where Plato taught; the Lyceum, noted for Aristotle's lectures; and the Cynosarges, allotted for the populace.

Vitruvius describes the structure and form of the ancient gymnasia, lib. v. cap. 11. They were called *gymnasia*, because several of the exercises were performed naked; and *palestræ*, from wrestling, which was one of the most usual exercises there: the Romans sometimes also called them *thermæ*, because the baths and bagnios made a principal part of the building.—It appears that they did not perform their exercises quite naked so early as the time of Homer, but always in drawers; which they did not lay aside before the 32d Olympiad. One Orsippus is said to have been the first who introduced the practice: for having been worsted by means of his drawers undoing and entangling him, he threw them quite aside, and the rest afterwards imitated him. They were not single edifices, but a knot of buildings united, being sufficiently capacious to hold many thousands of people at once; and having room enough for philosophers, rhetoricians, and the professors of all other sciences to read their lectures,—and wrestlers, dancers, and all others who had a mind to exercise,—at the same time without the least disturbance or interruption. They consisted of a great many parts. Vitruvius recites no less than 12, viz. 1. The exterior porticos, where the philosophers, rhetoricians, mathematicians, physicians, and other virtuosi, read public lectures, and where they also disputed and rehearsed their performances. 2. The ephebeum, where the youth assembled very early, to learn their exercises in private, without any spectators. 3. The coryceum, apodyterion, or gymnasterion, a kind of wardrobe, where they stripped, either to bathe or exercise. 4. The elæothesium, alipterion, or unctuarium, appointed for the unctions, which either preceded or followed the use of the bath, wrestling, pancratia, &c. 5. The conisterium or conistra, in which they covered themselves with sand or dust, to dry up the oil or sweat. 6. The palæstra, properly so called, where they practised wrestling, the pugillate, pancratia, and divers other exercises. 7. The sphæristerium or tennis-court, reserved for exercises wherein they used balls. 8. Large unpaved alleys, which comprehended the space between the porticos and the walls wherewith the edifice was surrounded. 9. The xytti, which were porticos for the wrestlers in winter or bad weather. 10. Other xyttis or open alleys, allotted for summer and fine weather, some of which were quite open, and others planted with trees. 11. The bathus, consisting of several different apartments. 12. The stadium, a large space of a semicircular form, covered with sand, and surrounded with seats for the spectators.

For the administration of the gymnasia, there were different officers: the principal were, 1. The gymnasiarcha, who was the director and superintendant of the whole. 2. The xyllarcha, who presided in the xyttus or stadium. 3. The gymnasta, or master of the exercises, who understood their different effects, and could accommodate them to the different complexions of the *athletæ*. 4. The pædotriba, whose business was mechanically to teach the exercises, without understanding their

sium.

Gymna-
stium,
Gymna-
stics.

their theory or use. Under these four officers were a number of subalterns, whose names distinguished their different functions.

The gymnastic exercises may be reduced to two general classes; as they depend either on the action of the body alone, or as they require external agents or instruments. The latter consisted chiefly in mounting the horse, driving the chariot, and swimming. The former were chiefly of two kinds; orchestice, and palæstrice.

The orchestice comprehended, 1. Dancing. 2. Cubistice, or the art of tumbling. 3. Sphæristice or tennis, including all the exercises with pilæ or balls.

The palæstrice comprised all exercises under the denomination *palæstra*; as wrestling, boxing, pancratia, hoplomachia, running, leaping, throwing the discus, the exercise of the javelin, and that of the hoop, denominated by the Greeks *τροχός*, which consisted in rolling an iron hoop five or six feet in diameter, beset with iron rings, the noise of which apprising the people to give way, afforded them also an amusement. Both strength and skill were requisite in directing this hoop, which was to be driven with an iron rod. To these must also be added the exercises belonging to the medicinal gymnastics; as, 1. Walking. 2. Vociferation, or shouting. 3. Holding one's breath. Hoffman enumerates no fewer than 55 sorts of exercises that were practised in the gymnasia.

GYMNASTICS, GYMNASTICE, or the GYMNASTIC art, denotes the art of performing exercises of the body, whether for defence, health, or diversion. See GYMNASIUM.

Several modern writers have treated of this art. M. Burette has given the history of gymnastics in the Memoirs of the Royal Academy of Inscriptions.

On the first establishment of society, men, being apprised of the necessity of military exercises, for repelling the insults of their neighbours, instituted games and proposed prizes to animate their youth to combats of divers kinds. And as running, leaping, strength and dexterity of arm in throwing the javelin, driving a ball, or tossing a quoit, together with wrestling, &c. were exercises suited to the manner of fighting in those days; so the youth vied to excel in them, in the presence of the aged, who sat as their judges, and dispensed prizes to the conquerors; till what was originally only amusement, became at length a matter of such importance, as to interest great cities and entire nations in its practice. Hence arose an emulation and eagerness to excel, in hopes, one day, of being proclaimed and crowned conquerors in the public games, which was the highest honour a mortal could arrive at: nay, they went so far as to imagine, that even gods and demigods were not insensible of what men were so captivated with; and, in consequence hereof, to introduce the greatest part of these exercises into their religious ceremonies, the worship of their gods, and the funeral honours done to the manes of the dead.

Though it be hard to determine the precise epocha of the gymnastic art, yet it appears from several passages in Homer, and particularly the 23d book of the Iliad, where he describes the games celebrated at the funeral of Patroclus, that it was not unknown at the time of the Trojan war. From that description, which is the earliest monument now extant of the Grecian gymnastics,

it appears, that they had chariot-races, boxing, wrestling, foot-races, gladiators, throwing the discus, drawing the bow, and hurling the javelin; and it should seem, from the particular account Homer gives of these exercises, that even then the gymnastic art wanted little of perfection: so that when Galen says there was no gymnastic art in Homer's days, and that it began to appear no earlier than Plato, he is to be understood of the medicinal gymnastics only. This last, indeed, had its rise later; because, while men continued sober and laborious, they had no occasion for it; but when luxury and idleness had reduced them to the sad necessity of applying to physicians, these, who had found that nothing contributed so much to the preservation and re-establishment of health as exercises, proportioned to the different complexions, ages, and sexes, did not fail to refer them to the practice of gymnastics.

According to Plato, one Herodicus, prior a little time to Hippocrates, was the first who introduced this art into physic; and his successors, convinced by experience of its usefulness, applied themselves in earnest to improve it. Hippocrates, in his book of Regimen, has given instances of it, where he treats of exercise in general, and of the particular effects of walking, with regard to health; also of the different sorts of races, either on foot or horseback; leaping, wrestling, the exercise of the suspended ball, called *corycus*, chironomy, unctions, frictions, rolling in the sand, &c. But as physicians did not adopt all the exercises of the gymnastic art in their practice, it came to be divided between them and the masters of martial and athletic exercises, who kept schools, the number of which was greatly increased in Greece. At length the Romans also caught the same taste; and, adopting the military and athletic exercises of the Greeks, they improved and advanced them to the utmost pitch of magnificence, not to say extravagance. But the declension of the empire involved the arts in its ruin, and, among others, gymnastics and medicine; which last unhappily then relinquished the title it had to the former, and has neglected to resume it ever since.

GYMNOPYRIS, in natural history, a name given by Dr Hill to the pyritæ of a simple internal structure, and not covered with a crust. See PYRITES.

Of these there are only two species. 1. A green variously shaped kind. 2. A botryoide kind.

The first species is the most common of all the pyritæ, and appears under a great diversity of shapes. It is very hard and heavy, very readily gives fire with steel, but will not at all ferment with aquafortis. The second species is very elegant and beautiful, and its usual colour is a very agreeable pale green; but what most distinguishes it from all other pyritæ is, that its surface is always beautifully elevated into tubercles of various sizes, resembling a cluster of grapes.

GYMNOSOPHISTS, a set of Indian philosophers, famous in antiquity; so denominated from their going barefoot. The word is formed of the Greek *γυμνός* and *σοφιστής*, q. d. a sophist or philosopher who goes naked.

This name was given to the Indian philosophers, whom the excessive heat of the country obliged to go naked; as that of *Peripatetics* was given to those who philosophised walking. The Gymnosophists, however, did not go absolutely naked; but only clothed them-

Gymnotus.

selves no farther than modesty required. There were some of these sages in Africa; but the most celebrated clan of them was in India. The African gymnosophists dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of house or cell. They did not form themselves into societies like those of India; but each had his private recess, where he studied and performed his devotions by himself. If any person had killed another by chance, he applied to these sages for absolution, and submitted to whatever penances they enjoined. They observed an extraordinary frugality, and lived only upon the fruits of the earth. Lucan ascribes to these Gymnosophists several new discoveries in astronomy.

As to the Indian Gymnosophists, they dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine nor married. Some of them practised physic, and travelled from one place to another; these were particularly famous for their remedies against barrenness. Some of them, likewise, pretended to practise magic, and to foretell future events.

In general, the Gymnosophists were wise and learned men: their maxims and discourses, recorded by historians, do not in the least favour of a barbarous education; but are plainly the result of great sense and deep thought. They kept up the dignity of their character to so high a degree, that it was never their custom to wait upon any body, not even upon princes themselves. They believed the immortality and transmigration of the soul: they placed the chief happiness of man in a contempt of the goods of fortune and the pleasures of sense, and gloried in having given faithful and disinterested counsels to princes and magistrates. It is said, that when they became old and infirm, they threw themselves into a pile of burning wood, in order to prevent the miseries of an advanced age. One of them, named *Calamus*, thus burnt himself in the presence of Alexander the Great.

+ Florid.
lib. I.

Apuleius† describes the Gymnosophists thus: "They are all devoted to the study of wisdom, both the elder masters and the younger pupils; and what to me appears the most amiable thing in their character is, that they have an aversion to idleness and indolence: accordingly, as soon as the table is spread, before a bit of victuals be brought, the youths are all called together from their several places and offices, and the masters examine them what good they have done since the sun-rise: here one relates something he has discovered by meditation; another has learned something by demonstration; and as for those who have nothing to allege why they should dine, they are turned out to work fasting."

The great leader of the Gymnosophists, according to Jerome, was one *Buddas*, called by Clemens Butta, who is ranked by Suidas among the Brachmans. That last author makes Buddas, the preceptor of Manes the Persian, the founder of the Gymnosophists.

GYMNOSPERMIA, in botany, (from γυμνός "naked," and σπέρμα "seed;") the first order in Linnaeus's class of didynamia. It comprehends those plants of that class which have naked seeds. The seeds are constantly four in number, except in one genus, viz. *phryma*, which is monospermous. See BOTANY, p. 431.

GYMNOTUS, in ichthyology, a genus of fishes

belonging to the order of apodes. They have two tentacula at the upper lip; the eyes are covered with the common skin; there are five rays in the membrane of the gills; the body is compressed, and carinated on the belly with a fin. There are five species, the most remarkable of which is the *electricus*, or electric eel, called by the French *anguille tremblante*. This species is peculiar to Surinam; and is found in the rocky parts of the river, at a great distance from the sea. The most accurate description we have of this fish is in the Philosophical Transactions for 1775, where Alex. Garden, M. D. gives an account of three of them brought to Charlestown in South Carolina. The largest was about three feet eight inches in length, and might have been from 10 to 14 inches in circumference about the thickest part of its body. The head was large, broad, flat, and smooth; impressed here and there with holes, as if perforated with a blunt needle, especially towards the sides, where they were more regularly ranged in a line on each side. There were two nostrils on each side; the first large, tubular, and elevated above the surface; the others small, and level with the skin. The eyes were small, flattish, and of a bluish colour, placed about three quarters of an inch behind the nostrils. The whole body, from about four inches below the head, was clearly distinguished into four longitudinal parts or divisions. The upper part or back was of a dark colour, and separated from the other parts on each side by the *lateral lines*. These lines took their rise at the base of the head, just above the pectoral fins, and run down the sides, gradually converging as the fish grew smaller to the tail. The second division was of a lighter and clearer colour than the first, inclining to blue. It seemed to swell out on each side; but towards the under part it is again contracted and sharpened into the third part or *carina*. This part is easily distinguished from the other two by its thinness, its apparent laxness, and by the reticulated skin of a more grey and light colour, with which it is covered. The *carina* begins about six or seven inches below the base of the head; and, gradually deepening or widening as it goes along, reaches down to the tail, where it is thinnest. The fourth part is a long, deep, soft, and wavy fin, which takes its rise about three or four inches at most below the head; and thus runs down the sharp edge of the *carina* to the extremity of the tail. The situation of the anus was very singular; being an inch more forward than the pectoral fins. Externally it seemed to be a pretty large *rima*; but the formed excrements were only the size of a quill of a common dung-hill-fowl. There were two pectoral fins situated just behind the head, scarcely an inch in length; of a very thin, delicate consistence, and orbicular shape. They seemed to be chiefly useful in supporting and raising the head of the fish when he came up to breathe; which he was obliged to do every four or five minutes. Across the body were a number of small bands, annular divisions, or rather *rugæ* of the skin. By means of these the fish seemed to partake of the vermicular nature, had the power of lengthening or shortening its body like a worm, and could swim backwards as well as forwards, which is another property of the vermicular tribe. Every now and then it laid itself on one side in the water, as if to rest.—For an account of the singular properties of this fish, see ELECTRICITY, n° 255.

GY.

Gynæceum
||
Gypsies.

GYNÆCEUM, among the ancients, the apartment of the women, a separate room in the inner part of the house, when they employed themselves in spinning, weaving, and needle-work.

GYNÆCOCRACY, denotes the government of women, or a state where women are capable of the supreme command. Such are Britain and Spain.

GYNÆCOCRATUMENI, an ancient people of Sarmatia Europæa, inhabiting the eastern banks of the river Tanais, near its opening into the Palus Mæotis; thus called, as authors relate, because they had no women among them; or, rather, because they were under the dominion of women. The word is formed of γυνή woman, and κρατούμενος vanquished, of κρατεω I overcome q. d. overcome by women.

Fa. Hardouin, in his notes on Pliny, says, they were thus called, because, after a battle which they lost against the Amazons, on the banks of the Thermodoon, they were obliged to have venereal commerce with them, in order to get them children: *Et quod victicibus obsequantur ad procurandam eis sobolem.*—Hardouin calls them the husbands of the Amazons, *Amazonum connubia*; for, as the author observes, the word *unde* must be retrenched from Pliny, having been foisted into the text by people who were not masters of the author's meaning, *unde Amazonum connubia*. See AMAZONS. They who take the Amazons for a fabulous people, will conclude the same of the Gynæocratumenians.

GYNANDRIA, (from γυνή a “woman;” and ανήρ a “man.”) The name of the 20th class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers, in which the stamina are placed upon the style, or, to speak more properly, upon a pillar-shaped receptacle, resembling a style, which rises in the middle of the flower, and bears both the stamina and pointal; that is, both the supposed organs of generation. See BOTANY, p. 430.

The flowers of this class, says Linnæus, have a monstrous appearance, arising, as he imagines, from the singular and unusual situation of the parts of fructification.

GYPSIES, or EGYPTIANS, an outlandish tribe of vagabonds, who disguising themselves in uncouth habits, smearing their faces and bodies, and framing to themselves a canting language, wander up and down, and, under pretence of telling fortunes, curing diseases, &c. abuse the common people, trick them of their money, and steal all that they can come at.

They are a strange kind of commonwealth among themselves of wandering impostors and jugglers, who made their first appearance in Germany about the beginning of the 16th century. Munster, it is true, who is followed and relied upon by Spelman, fixes the time of their first appearance to the year 1417: but as he owns that the first whom he ever saw were in 1529, it is probably an error of the press for 1517; especially as other historians inform us, that when Sultan Selim conquered Egypt in the year 1517, several of the natives refused to submit to the Turkish yoke, and revolted under one Zinganeus; whence the Turks call them Zinganees; but being at length surrounded and banished, they agreed to disperse in small parties all over the world, where their supposed skill in the black art gave them an universal reception in that age of su-

perstition and credulity. In the compass of a very few years they gained such a number of idle profelytes (who imitated their language and complexion, and betook themselves to the same arts of chiromancy, begging, and pilfering), that they became troublesome, and even formidable, to most of the states of Europe. Hence they were expelled from France in the year 1560, and from Spain in 1591. And the government of England took the alarm much earlier: for in 1530 they are described by Stat. 22. Hen. VIII. c. 10. as “an outlandish people calling themselves Egyptians, using no craft nor feat of merchandize, who have come into this realm, and gone from shire to shire, and place to place, in great companies, and used great, subtle, and crafty means to deceive the people; bearing them in hand that they by palmistry could tell mens and womens fortunes; and so many times by craft and subtilty have deceived the people of their money, and also have committed many heinous felonies and robberies.” Wherefore they are directed to avoid the realm, and not to return under pain of imprisonment, and forfeiture of their goods and chattels; and upon their trials for any felony which they may have committed, they shall not be intitled to a jury *de medietate lingue*. And afterwards it is enacted, by statutes 1st and 2d Ph. and Mary, c. 4. and 5th Eliz. c. 20. that if any such persons shall be imported into the kingdom, the importer shall forfeit 40l. And if the Egyptians themselves remain one month in the kingdom, or if any person being 14 years old, whether natural-born subject or stranger, which hath been seen or found in the fellowship of such Egyptians, or which hath disguised him or herself like them, shall remain in the same one month at one or several times, it is felony without benefit of clergy. And Sir M. Hale informs us, that at one Suffolk assizes, no less than 13 persons were executed upon these statutes a few years before the restoration. But, to the honour of our national humanity, there are no instances more modern than this of carrying these laws into practice; and the last sanguinary act is itself now repealed by 23 Geo. III. c. 54.

In Scotland they seem to have enjoyed some share of indulgence; for a writ of privy seal, dated 1594, supports John Faw, lord and earl of Little Egypt, in the execution of justice on his company and folk, conform to the laws of Egypt, and in punishing certain persons there named who rebelled against him, left him, robbed him, and refused to return home with him. James's subjects are commanded to assist in apprehending them, and in assisting Faw and his adherents to return home. There is a like writ in his favour from Mary Q. of Scots 1553, and in 1554 he obtained a pardon for the murder of Nunan Small. So that it appears he had staid long in Scotland, and perhaps some of the time in England; and from him this kind of strolling people might receive the name of *Faw Gang*, which they still retain.

A very circumstantial account of this singular race of vagrants has been lately given in an express *Inquiry* concerning them, written in German by H. M. G. Grellman, and translated by Mr Raper. It is incredible to think how this regular swarm of banditti has spread itself over the face of the earth. They wander about in Asia, in the interior parts of Africa, and, like locusts, have over-run most of the European nations.

In

Gypsies. In the reigns of Henry VIII. and queen Elizabeth, as we have seen, they were set up as a mark of general persecution in England; yet their numbers do not appear to have much diminished. Spain is supposed by Mr Twiss to contain 40,000 of these vagrants; but by others 60,000; and by some even double that number. They are less numerous in France in consequence of the strictness of the police. In Italy they abound, especially in the dominions of the church, on account of the bad police and the prevalence of superstition, which permit and entice them to deceive the ignorant. They are scattered, though not in great numbers, through Germany, Denmark, Sweden, and Russia; but their chief population is in the south-east parts of Europe, which seem to be the general rendezvous of the gypsy nation. At a moderate computation Europe contains more than seven hundred thousand of these vagabonds.—For near four centuries they have wandered through the world; and in every region, and among every people, whether barbarous or civilised, they have continued equally unchanged by the lapse of time, the variation of climate, and the force of example. Their singular physiognomy and particular manners are the same in every country. Their swarthy complexion receives no darker shade from the burning sun of Africa, nor any fairer tincture from the temperate climates of Europe; they contract no additional laziness in Spain, nor acquire any new industry in England; in Turkey they behold the mosque and the crescent with equal indifference as they do the reformed and the catholic church in Europe. In the neighbourhood of civilised life they continue barbarous; and, beholding around them cities and settled inhabitants, they live in tents or holes in the earth, and wander from place to place as fugitives and vagabonds.

They are passionately fond of ornaments; in which however they consult neither propriety nor consistency; they will wear an old laced coat, while the rest of the garments scarcely hang together. In Hungary and Transylvania, their summer habitations are tents; their winter ones holes 10 or 12 feet deep in the earth, except such as keep inns, or exercise trades. They are fond of plate, particularly silver cups, which they bury under the hearth for security. Their principal occupations are, smith's work, or tinkers, or wooden ware, and horse-dealing; and in Hungary and Transylvania they are executioners of criminals, slayers of dead beasts, and washers of gold. The women deal in old cloaths, prostitution, wanton dances, and fortune-telling. Notwithstanding these occupations, the majority of this people are lazy, beggars, and thieves. They bring up their children to their own professions, and are very fond of them. They have few disorders, except the measles and small-pox, and weakness in their eyes, occasioned by the smoke, and live to an advanced age, with a strong attachment to life. Their physic is saffron in their soups, or bleeding.

These people, however, appear to be distinguished by different singularities in different countries. At least in the following circumstances the German gypsies differ widely from those we commonly meet with in England. It is a great feast to them, our author says, whenever they can procure a roast of cattle that died of any distemper. It is all one to them, whether

it be carrion of a sheep, hog, cow, or other beast, horse-flesh only excepted; they are so far from being disgusted with it, that to eat their fill of such a meal, is to them the height of epicurism. When any one censures their taste, or shows surprise at it, they answer, "The flesh of a beast which God kills, must be better than of one killed by the hand of man." They therefore take every opportunity of getting such dainties. That they take carrion from a laystall, as is affirmed of the gypsies in Hungary, is by no means certain, any more than that they eat horse-flesh. But if a beast out of an herd dies, and they find it before it becomes rotten and putrified; or if a farmer gives them notice of a cow dead, they proceed, without hesitation, to get possession of this booty. Their favourite object is animals that have been destroyed by fire; therefore, whenever a conflagration has happened, either in town or country, the next day the gypsies, from every neighbouring quarter, assemble and draw the suffocated half consumed beasts out of the ashes. Men, women, and children, in troops, are extremely busy, joyfully carrying the flesh home to their dwelling-places; they return several times, provide themselves plentifully with this roast meat, and gluttonize in their huts as long as their noble fare lasts.

The gypsies have, at least in Transylvania, a sort of regular government, rather nominal than real or effective. They have their leaders or chiefs, whom they distinguish by the Sclavonian title, *Waywode*. To this dignity every person is eligible who is of a family descended from a former waywode; but the preference is generally given to those who have the best clothes and the most wealth; who are of a large stature, and not past the meridian of life.—Of religion, however, they have no sense; though, with their usual cunning and hypocrisy, they profess the established faith of every country in which they live. They also speak the languages of the respective countries, yet have a language of their own; from whence derived, authors differ. The only science which they have attained is music. Their poetry is ungrammatical indecent rhyme.

Their general character and capacities are thus described: Imagine people of a childish way of thinking; their minds filled with raw, undigested conceptions; guided more by sense than reason; using understanding and reflection so far only as they promote the gratification of any particular appetite; and you have a perfect sketch of the gypsies character. They are lively, uncommonly loquacious and chattering; fickle in the extreme, consequently inconstant in their pursuits; faithless to every body, even their own cast; void of the least emotion of gratitude, frequently rewarding benefits with the most insidious malice. Fear makes them slavishly compliant when under subjection; but having nothing to apprehend, like other timorous people, they are cruel. Desire of revenge often causes them to take the most desperate resolutions. To such a degree of violence is their fury sometimes excited, that a mother has been known, in the excess of passion, to take her small infant by the feet, and therewith strike the object of her anger, when no other instrument has readily presented itself. They are so addicted to drinking, as to sacrifice what is most necessary to them, that they may feast their palate with spirits. They have, too, what

Gypsies

what one would little expect, an enormous share of vanity, which shows itself in their fondness for fine clothes, and their gait and deportment when dressed in them. One might imagine, that this pride would have the good effect to render a gypsy cautious not to be guilty of such crimes as subject him to public shame; but here comes in the levity of character, for he never looks to the right nor to the left in his transactions. In an hour's time he forgets that he is just untied from the whipping post. But their pride is grounded on mere idle conceit, as appears plainly from their making it a point of honour to abuse their companions, and put on a terrible appearance in the public market, where they are sure to have many spectators; they cry out, make a violent noise, challenge their adversary to fight, but very seldom any thing comes of it. Thus the gypsy seeks honour, of which his ideas coincide very little with those of other people, and sometimes deviate entirely from propriety.

"Nothing (continues our author) can exceed the unrestrained depravity of manners existing among these people, I allude particularly to the other sex. Unchecked by any idea of shame, they give way to every desire. The mother endeavours, by the most scandalous arts, to train up her daughter for an offering to sensuality; and *this* is scarce grown up before she becomes the seducer of others. Laziness is so prevalent among them, that were they to subsist by their own labour only, they would hardly have bread for two of the seven days in the week. This indolence increases their propensity to stealing and cheating, the common attendants on idleness. They seek to avail themselves of every opportunity to satisfy their lawless desires. Their universal bad character therefore for fickleness, infidelity, ingratitude, revenge, malice, rage, depravity, laziness, knavery, thievishness, and cunning, though not deficient in capacity and cleverness, render these people of no use in society, except as soldiers to form marauding parties. Persons in their company, and under their disguise, have formed dangerous designs against cities and countries. They have been banished from almost all civilized states, in their turn, except Hungary and Transylvania, and to little purpose. Our author is of opinion, that as Turkey would allow them toleration, it would be better for the European states to take some steps for cultivating and civilizing them, and making them useful. But while they are insensible of religion and strongly attached to their own manners, it is to be feared the attempt will be impracticable. This appears from a very intelligent Hungarian lady's experience on the subject, communicated in a letter as follows: 'There are a great number of them on my estates, but I have permitted two families in particular to establish themselves at the place of my own residence, under the express condition that no others shall come here and join them. I took all possible pains to make them reasonable creatures. I set the elder ones to work; the younger ones tend the cattle. I observed that they were more fond of horses than any thing else; for which reason I placed a gypsy under each groom. I had their children clothed, that none of them might be running about naked, according to their usual practice. It appeared, however, that custom was become nature with them. The old ones worked diligently so long as any body stood over them; the moment their back was turn-

ed, they all got together in a circle, their legs across, facing the sun, and chattered. Thus they cannot possibly earn more, indeed hardly so much, as would find them bread, although very cheap with us; for the bread I give them does not stand me in half a kreutzer the pound. Even in winter they cannot bear a hat on their head nor shoes on their feet. The boys run like wild things wherever they are sent, either on foot or on horseback; but they spoil horses unmercifully, beat them on the head, jerk the bits in their mouths, so as to make them run down with blood. They cannot be brought by any means whatever to dress horses. Cloath them as you will, they always sell or lose their cloaths. In a word, one cannot but consider them as void of reason; it is really shocking to see even well grown children put whatever they find into their mouths, like infants before they can speak; wherefore they eat every thing, even carrion, let it stink never so much. Where a mortality happens among the cattle, there these wretched beings are to be found in the greatest numbers.'

The origin of this people, as we have seen, has been generally believed to be Egyptian; and that belief is as old as their existence in Europe. Thomasius, Salmon the English geographer, and lately Signior Griselini, have endeavoured to prove it by satisfactory evidence. This theory, however, according to our author, is without foundation. The Egyptian descent of these people, he thinks, is not only destitute of proofs, but the most positive evidence is found to contradict it. Their language differs entirely from the Coptic; and their customs are very different from those of the Egyptians. They are indeed to be found in Egypt; but they wander about there as strangers, and form a distinct people, as in other countries. The expressions of Bellonius are strong and decisive: "No part of the world, I believe, is free from those banditti, wandering about in troops, whom we by mistake call *Egyptians* and *Bohemians*. When we were at Cairo, and in the villages bordering on the Nile, we found troops of these strolling thieves sitting under palm-trees; and they are esteemed foreigners in Egypt as well as among us."

The Egyptian descent of the gypsies being rejected, our author next endeavours to show that they come from Hindostan. The chief basis of his theory, however, is no other than that very dubious one, a similarity of language. He adds a long vocabulary of the gipsy and the Hindostanic languages; in which, it must be confessed, many words are the same; but many are different. A principal proof which he adduces on this head is from the relation of Captain Szekely von Doba, to whom a printer in 1763 related, that a preacher of the Reformed church, when a student at Leyden, being intimately acquainted with three young Malabar students, took down 1000 of their words, which he fancied corresponded with the gipsy language; and they added, that a tract of land in their island was named *Ozigania*. He repeated these words to the Raber gypsies, who explained them without trouble or hesitation. This account was published in the Vienna Gazette. Supposing these three young men to be sons of Bramins, who use the Sanscrit, the common language of Hindostan comes as near to that as modern Italian to pure Latin. The comparison of the

Gypsies

Gypsies.

the two languages takes up above 30 pages; and Mr Grellman thinks it establishes his system. The same opinion is maintained by Mr Marsden, in a paper upon this subject in the 7th volume of the *Archeologia*. The numerals, however, both in Hindostanic and gipsy, differ greatly as stated by the two authors. And here, as in other such comparisons, one is astonished at the credulity of the comparers of orthoepy and orthography (as a periodical critic observes), which can have no connection in languages with which we are not perfectly familiar, even were both languages reduced to writing by their respective people: how much less, then, where one of the two languages is never reduced to writing, as is the case of the gipsy, but is blended with the language of the country where the clan resides? This appears from the correspondence of several words in all languages with the gipsy. Mr Grellman acknowledges the two gipsy versions of the Lord's Prayer, at different periods, differ so widely, that one would almost be inclined to doubt whether they were really the same language. We think we can discern a few words differently indeed written, but probably pronounced alike. Nor can we, in all the languages in which Chamberlayne gives the Lord's Prayer, perceive the least resemblance to the gipsy name of father, *Dade* and *Dad*, except in the Welsh, *Taad*. In prosecuting his argument, Mr Grellman does not insist on the similarity of colour between the two people, nor on the cowardice common to both, nor on the attachment of the Indians to tents, or letting their children go naked; all these being traits to be met with in other nations: but he dwells on the word *Polgar*, the name of one of the first gipsy leaders, and of the Hindostanic god of marriage; also on the correspondence between the travelling smiths in the two people, who carry two pair of bellows; the Indian's boy blows them in India, the wife or child of the gipsy in Europe: As if every travelling tinker, in every nation where tinkers travel, had not the same journeymen. In lascivious dances and chiromancy the two people agree; nor are these uncommon in other parts of the globe. The excessive loquacity of the two people is produced as similar; as if no other nations in the world were loquacious. Fainter resemblances are, a fondness for saffron, and the intermarrying only with their own people. The last position in the author's theory is, that the gipsies are of the lowest class of Indians, namely, *Parias*, or, as they are called in Hindostan, *Suders*. He compares the manners of this class with those of the gipsies, and enumerates many circumstances in which they agree: some of the comparisons are frivolous, and prove nothing. As an instance of which we may take the following: 'Gipsies are fond of being about horses; the *Suders* in India likewise, for which reason they are commonly employed as horse-keepers by the Europeans resident in that country.' This reasoning does not prove that the gipsies are *Suders*, any more than that they are Arabians or Yorkshire farmers.

The objections, however, to which this learned and industrious author's theory is liable, are such as only show it to be by no means satisfactory; but do not prove that it is wrong. It may possibly be right; and upon this supposition the cause of their emigration from their country, he conjectures, not without probability, to be the war of Timur Beg in India. In the

N^o 147.

years 1408 and 1409 this conqueror ravaged India; and the progress of his arms was attended with devastation and cruelty. All who made resistance were destroyed; those who fell into the enemy's hands were made slaves; of these very slaves 100,000 were put to death. As on this occasion an universal panic took place, what could be more natural than that a great number of terrified inhabitants should endeavour to save themselves by flight?—In the last place, the author endeavours to trace the route by which the gipsies came from Hindostan to Europe: but here he justly acknowledges that all that can be said on the subject is mere surmise; and, upon the whole, after perusing all the preceding details, the reader will probably be of opinion that there still hangs a cloud over the origin of this extraordinary race.

GYPHOPHILA, in botany: A genus of the digynia order, belonging to the decandria class of plants; and in the natural method ranking under the 22d order, *Caryophyllei*. The calyx is monophyllous, campanulate, and angulated; the petals are five in number, ovate, and sessile; the capsule globose and unilocular.

GYPHOPHILA, PLASTER-STONE, or *Alabaster*; a natural combination of the calcareous earth with vitriolic acid. See **ALABASTER**.

The properties of gypsum, according to Cronstedt, are, 1. It is looser and more friable than a calcareous earth. 2. It does not effervesce with acids either in its crude or calcined state; or at most but in a very slight degree, in proportion to what it wants of the vitriolic acid for the complete saturation of its base. 3. It falls into powder in the fire very readily. 4. When burnt without being made red-hot, its powder readily concretes with water into a mass which soon hardens; but without any sensible heat being excited in the operation. 5. According to our author, it is nearly as difficult of fusion as limestone; and shows almost the same effects upon other bodies with limestone, though the acid of vitriol seem to promote the vitrification. M. Magellan, however, informs us, that he has found most of the gypseous kind, particularly the fibrous, to melt in the fire pretty easily by themselves. 6. When melted in the fire with borax, it puffs and bubbles very much, and for a long time during the fusion. According to M. Magellan, when a small quantity of any gypsum is melted together with borax, the glass becomes colourless and transparent; but some sorts of alabaster and sparry gypsum, when melted in quantity with borax, yield a fine yellow transparent coloured glass, resembling that of the best topazes; but if too much of the gypsum is used in proportion to the borax, the glass becomes opaque, just as it happens with the pure limestone. 7. When burnt with any inflammable matter it emits a sulphureous smell, and may thus be decomposed, as well as by either of the fixed alkaline salts; but if this last method is followed, there ought to be five or six times as much salt as there is of gypsum. 8. On being decomposed in this manner the residuum commonly shows some signs of iron. The species are,

1. Friable gypseous earth of a white colour, found in Saxony.

2. Indurated gypsum of a solid texture, the particles of which are not visible, commonly called *alabaster*. This is sometimes found unsaturated with vitriolic acid; in

Gypsophila,
Gypsum.

Gypsum. in which case only it will effervesce with aquafortis, as it is said to do under the article ALABASTER. It is very easily sawed or cut, and takes a dull polish. It is of several kinds; as, white; clear and transparent from Persia, opaque from Italy and Trapani in Sicily; of a yellow colour, of which there are likewise two kinds, transparent and opaque; the former being met with in the eastern countries, the latter in Spain. Brunnick informs us, that in this country there are a great many fine varieties of the species we treat of; and from hence he supposes that the ancients obtained the beautiful alabasters they used. Fabroni tells us, that a great variety of fine alabasters are met with in Italy. Twenty-four quarries of them, each of a different colour, are now worked out at Volterra; but he is of opinion that the Romans brought the greatest part of the alabasters they made use of from Greece.

3. Gypsum of a scaly texture, or common plaster of Paris. This is found in many different countries, of two kinds; viz. white with coarse scales, or with small scales yellowish or greyish. According to Bergman, plaster contains $\frac{46}{100}$ of vitriolic acid, $\frac{32}{100}$ of pure calcareous earth, and 22 of water. It is soluble in 500 times its weight of warm water, or 450 times its weight of boiling water. It is well known by its property of forming an hard mass with water after being slightly burned; and during this consolidation a slight degree of heat is produced, though less than when lime is slaked. It is often employed in building; and may be taken off and used again and again for the same purpose.

4. Fibrous gypsum, or plaster stone, has likewise two varieties, viz. with coarse or with fine fibres. It is of a white colour.

5. Selenites, or spar-like gypsum, by some also called *glacies manæ*, and confounded with the clear and transparent mica. It is found of two kinds, clear and transparent, or yellowish and opaque.

6. Crystallized gypsum, or gypseous drusen. This is found composed of wedge-shaped and sometimes of capillary crystals, sometimes white and sometimes yellowish.

7. Stalactitical gypsum is found of a great many different forms and colours. When found in large pieces it commonly varies between white and yellow, and likewise in its transparency in different parts of the same mass. It is used as alabaster in several works.

Besides the countries already mentioned, England abounds with substances of a gypseous nature. There

are plenty in Derbyshire and Nottinghamshire, so fine as to be used like alabaster, that is, to take a fine polish. In the counties just mentioned there are large pits of this kind, also in most of the cliffs of the Severn, especially at the Old Passage in Somersetshire. A very fine semipellucid solid alabaster is found in Derbyshire. Very fine fibrous tales are also found in the above mentioned pits of stone, and many other places. Selenites every where abound, so that it is impossible to enumerate the different places. Very fine gypseous drusen are found in Sheppey Isle, and some exceedingly beautiful, large and clear as crystal, have been dug from the salt-rocks at Nantwich in Cheshire. The selenites rhomboidales is found in plenty in England, tho' rare in other countries. Shotover hill in Oxfordshire is remarkable for them. The Isle of Sheppey affords a kind of spar-like gypsum, of a fibrous nature, and always accreting like the radiations of a star on the septaria, and thence called *stella septarii*.

The principal use of gypsum is as a material for small statues and figures of various kinds, also for moulds for casting wax-work, &c. It has lately been introduced as a manure in France and America, though its success in this respect has not yet been sufficiently experienced.

GYR-FALCO, in zoology, the name of a large and fierce species of falcon, called in English the *jer-falcon*. See FALCO.

It is a very bold and daring bird, attacking all other fowl without reserve, particularly the heron and stork kinds. The other falcons are all afraid of this.

GYRINUS, in zoology; a genus of insects of the coleoptera order. The generic characters are: The antennæ are cylindrical, stiff, and shorter than the head; and the eyes are four, two on the upper and two on the under part of the head. Mr Barbut, however, says that the eyes only appear on the upper and under parts of the head, but that they are not four. The natator, or common water-flea, is of a bright black colour; the feet are yellow, flat, and large; the insect is in length one-third of an inch. It runs with great celerity in circles on the surface of the waters, and is very difficult to catch, plunging down instantaneously when attempted to be taken. There are eight other species, which frequent the waters in different parts of the globe.

GYSHORN, a town of Germany, in the duchy of Lunenburgh, situated on the river Aller, in E. Long. 10. 45. N. Lat. 52. 50.

between the lips, closing, as it were, by a gentle motion of the lower jaw to the upper, and the tongue nearly approaching the palate.

There seems to be no doubt, but that our *h*, which is the same with that of the Romans, derived its figure from that of the Hebrew ה. And, indeed, the Phœnicians, most ancient Greeks and Romans, used the same figure with our H, which in the series of all these alphabets keeps its primitive place, being the eighth letter.

H, used as a numeral, denotes 200; and with a dash over it, H̄, 200,000.

As an abbreviation, H was used by the ancients to denote *homo*, *heres*, *hora*, &c. Thus H. B. stood for *heres bonorum*; and H. S. corruptly for L. L. S. *sesterce*; and H. A. for Hadrianus.

HAAG, or HAG, a town of the duchy of Bavaria in Germany, seated on a hill on the west side of the river Inn, in E. Long. 12. 23. N. Lat. 48. 16.

HABAKKUK, one of the twelve lesser prophets, whose prophecies are taken into the canon of the Old Testament. The name is written in the Hebrew with הַבְּתִי; and signifies "a wrestler." There is no precise time mentioned in Scripture when this Habakkuk lived; but from his predicting the ruin of the Jews by the Chaldeans, it may be concluded that he prophesied before Zedekiah, or about the time of Manasseh. He is reported to have been the author of several prophecies which are not extant: but those that are indisputably his, are contained in three chapters. In these the prophet complains very pathetically of the disorders which he observed in the kingdom of Judæa. God reveals to him, that he would shortly punish them in a very terrible manner by the arms of the Chaldeans. He foretels the conquests of Nebuchadnezzar, his metamorphosis, and death. He foretels, that the vast designs of Jehoiakim would be frustrated. He speaks against a prince (probably the king of Tyre) who built with blood and iniquity; and he accuses another king (perhaps the king of Egypt) of having intoxicated his friend, in order to discover his nakedness. The third chapter is a song or prayer to God, whose majesty he describes with the utmost grandeur and sublimity of expression.

HABAT, a province of Asia, in Barbary, and in the kingdom of Fez. It is surrounded by the Mediterranean, the Straits of Gibraltar, and the Atlantic Ocean. The principal towns are Arzilla, Tetuan, and Ceuta; which last is in possession of the Spaniards.

HABDALA, a ceremony of the Jews observed on the evening of the sabbath, when every one of the family is come home. At that time they light a taper or lamp, with two wicks at least. The master of the family then takes a cup, with some wine, mixed with fragrant spices, and having repeated a passage or two of scripture, as for example, "I will take the cup of salvation," &c. Psal. cxvi. and "The Jews had light and gladness," &c. Esth. viii. he blesses the wine and spices. Afterwards he blesses the light of the fire; and then casts his eyes on his hands and nails, as remembering that he is going to work. The whole is intended to signify, that the sabbath is over, and is from that moment divided from the day of labour which follows. For this reason the ceremony is called *Habdala*, which signifies "distinction." After the cere-

mony is over, and the company breaks up, they wish one another, not "a good night," but "a good week."

HABEAS CORPUS, in law, is the great remedy in cases of *False Imprisonment*. The incapacity of the three other remedies referred to under that article, to give complete relief in every case, hath almost entirely antiquated them, and hath caused a general recourse to be had, in behalf of persons aggrieved by illegal imprisonment, to the present writ, the most celebrated in the English law. Of this there are various kinds made use of by the courts at Westminster, for removing prisoners from one court into another for the more easy administration of justice. Such is the *habeas corpus ad respondendum*, when a man hath a cause of action against one who is confined by the process of some inferior court; in order to remove the prisoner, and charge him with this new action in the court above. Such is that *ad satisfaciendum*, when a prisoner hath had judgment against him in an action, and the plaintiff is desirous to bring him up to some superior court to charge him with process of execution. Such also are those *ad prosequendum*, *testificandum*, *deliberandum*, &c.; which issue when it is necessary to remove a prisoner, in order to prosecute or bear testimony in any court, or to be tried in the proper jurisdiction wherein the fact was committed. Such is, lastly, the common writ *ad faciendum et recipiendum*, which issues out of any of the courts of Westminster-hall, when a person is sued in some inferior jurisdiction, and is desirous to remove the action into the superior court; commanding the inferior judges to produce the body of the defendant, together with the day and cause of his caption and detainer (whence the writ is frequently denominated an *habeas corpus cum causa*), to do and receive whatsoever the king's court shall consider in that behalf. This is a writ grantable of common right, without any motion in court; and it instantly supercedes all proceedings in the court below. But, in order to prevent the surreptitious discharge of prisoners, it is ordered by statute 1 & 2 P. & M. c. 13. that no *habeas corpus* shall issue to remove any prisoner out of any goal, unless signed by some judge of the court out of which it is awarded. And, to avoid vexatious delays by removal of frivolous causes, it is enacted by statute 21 Jac. I. c. 23. that, where the judge of an inferior court of record is a barrister of three years standing, no cause shall be removed from thence by *habeas corpus* or other writ, after issue or demurrer deliberately joined: that no cause, if once remanded to the inferior court by writ of *procedendo* or otherwise, shall ever afterwards be again removed: and that no cause shall be removed at all, if the debt or damages laid in the declaration do not amount to the sum of five pounds. But an *expedient* having been found out to elude the latter branch of the statute, by procuring a nominal plaintiff to bring another action for five pounds or upwards (and then by the course of the court the *habeas corpus* removed both actions together), it is therefore enacted by statute 12 Geo. I. c. 29. that the inferior court may proceed in such actions as are under the value of five pounds, notwithstanding other actions may be brought against the same defendant to a greater amount.

But the great and efficacious writ, in all manner of illegal

Habeas
Corpus.Blackst.
Comment.

illegal confinement, is that of *habeas corpus ad subjiciendum*; directed to the person detaining another, and commanding him to produce the body of the prisoner, with the day and cause of his caption and detention, *ad faciendum, subjiciendum, et recipiendum*, to do, submit to, and receive whatsoever the judge or court awarding such writ shall consider in that behalf. This is a high prerogative writ, and therefore by the common law issuing out of the court of king's bench, not only in term-time, but also during the vacation, by a *fiat* from the chief justice, or any other of the judges, and running into all parts of the king's dominions: for the king is at all times intitled to have an account why the liberty of any of his subjects is restrained, wherever that restraint may be inflicted. If it issues in vacation, it is usually returnable before the judge himself who awarded it, and he proceeds by himself thereon; unless the term should intervene, and then it may be returned in court. Indeed, if the party were privileged in the courts of common pleas and exchequer, as being an officer or suitor of the court, an *habeas corpus ad subjiciendum* might also have been awarded from thence; and, if the cause of imprisonment were palpably illegal, they might have discharged him: but if he were committed for any criminal matter, they could only have remanded him, or taken bail for his appearance in the court of king's bench; which occasioned the common pleas to discountenance such applications. It hath also been said, and by very respectable authorities, that the like *habeas corpus* may issue out of the court of chancery in vacation: but, upon the famous application to lord Nottingham by Jenks, notwithstanding the most diligent searches, no precedent could be found where the chancellor had issued such a writ in vacation; and therefore his lordship refused it.

In the court of king's-bench it was, and is still, necessary to apply for it by motion to the court, as in the case of all other prerogative writs (*certiorari*, prohibition, *mandamus*, &c.) which do not issue as of mere course, without showing some probable cause why the extraordinary power of the crown is called in to the party's assistance. For, as was argued by lord chief justice Vaughan, "it is granted on motion, because it cannot be had of course; and there is therefore no necessity to grant it: for the court ought to be satisfied that the party hath a probable cause to be delivered." And this seems the more reasonable, because, when once granted, the person to whom it is directed can return no satisfactory excuse for not bringing up the body of the prisoner. So that, if it issued of mere course, without showing to the court or judge some reasonable ground for awarding it, a traitor or felon under sentence of death, a soldier or mariner in the king's service, a wife, a child, a relation, or a domestic, confined for insanity or other prudential reasons, might obtain a temporary enlargement by suing out an *habeas corpus*, though sure to be remanded as soon as brought up to the court. And therefore Sir Edward Coke, when chief justice, did not scruple, in 13 Jac. I. to deny a *habeas corpus* to one confined by the court of admiralty for piracy; there appearing, upon his own showing, sufficient grounds to confine him. On the other hand, if a probable ground be shown, that the party is imprisoned without

just cause, and therefore hath a right to be delivered, the writ of *habeas corpus* is then a writ of right, which "may not be denied, but ought to be granted to every man that is committed, or detained in prison, or otherwise restrained, though it be by the command of the king, the privy-council, or any other."

In the articles LIBERTY and RIGHTS, we expatiated at large on the personal liberty of the subject. This was shown to be a natural inherent right, which could not be surrendered or forfeited unless by the commission of some great and atrocious crime, and which ought not to be abridged in any case without the special permission of law. A doctrine coeval with the first rudiments of our constitution; and handed down to us from the Anglo-Saxons, notwithstanding all their struggles with the Danes, and the violence of the Norman conquest: asserted afterwards and confirmed by the conqueror himself and his descendants: and though sometimes a little impaired by the ferocity of the times, and the occasional despotism of jealous or usurping princes, yet established on the firmest basis by the provisions of *magna charta*, and a long succession of statutes enacted under Edward III. To assert an absolute exemption from imprisonment in all cases, is inconsistent with every idea of law and political society; and in the end would destroy all civil liberty, by rendering its protection impossible: but the glory of the English law consists in clearly defining the times, the causes, and the extent, when, wherefore, and to what degree, the imprisonment of the subject may be lawful. This it is which induces the absolute necessity of expressing upon every commitment the reason for which it is made; that the court, upon an *habeas corpus*, may examine into its validity; and according to the circumstances of the case may discharge, admit to bail, or remand the prisoner.

And yet, early in the reign of Charles I. the court of king's-bench, relying on some arbitrary precedents (and those perhaps misunderstood), determined * that they could not upon an *habeas corpus* either bail or deliver a prisoner, though committed without any cause assigned, in case he was committed by the special command of the king, or by the lords of the privy-council. This drew on a parliamentary inquiry, and produced the *petition of right*, 3 Car. I. which recites this illegal judgment, and enacts that no freeman hereafter shall be so imprisoned or detained. But when, in the following year, Mr Selden and others were committed by the lords of the council, in pursuance of his majesty's special command, under a general charge of "notable contempts and stirring up sedition against the king and government," the judges delayed for two terms (including also the long vacation) to deliver an opinion how far such a charge wasailable; and when at length they agreed that it was, they however annexed a condition of finding sureties for the good behaviour, which still protracted their imprisonment; the chief justice Sir Nicholas Hyde, at the same time declaring ||, that "if they were again remanded for that cause, perhaps the court would not afterwards grant a *habeas corpus*, being already made acquainted with the cause of the imprisonment." But this was heard with indignation and astonishment by every lawyer present; according to Mr Selden's

Habeas
Corpus.* State
Trials, viii.
136.

† Ibid. 240.

Habeas
Corpus.

own account of the matter, whose resentment was not cooled at the distance of four and twenty years.

These pitiful evasions gave rise to the statute 16 Car. I. c. 10. §. 8. whereby it is enacted, that if any person be committed by the king himself in person, or by his privy council, or by any of the members thereof, he shall have granted unto him, without any delay upon any pretence whatsoever, a writ of *habeas corpus*, upon demand or motion made to the court of king's bench or common-pleas; who shall thereupon, within three court-days after the return is made, examine and determine the legality of such commitment, and do what to justice shall appertain, in delivering, bailing, or remanding such prisoner. Yet still in the case of Jenks, before alluded to, who in 1676 was committed by the king in council for a turbulent speech at Guildhall, new shifts and devices were made use of to prevent his enlargement by law; the chief justice (as well as the chancellor) declining to award a writ of *habeas corpus ad subjiciendum* in vacation, though at last he thought proper to award the usual writs *ad deliberandum*, &c. whereby the prisoner was discharged at the Old Bailey. Other abuses had also crept into daily practice, which had in some measure defeated the benefit of this great constitutional remedy. The party imprisoning was at liberty to delay his obedience to the first writ, and might wait till a second and a third, called an *alias* and a *pluries*, were issued, before he produced the party: and many other vexatious shifts were practised to detain state-prisoners in custody. But whoever will attentively consider the English history, may observe, that the flagrant abuse of any power, by the crown or its ministers, has always been productive of a struggle; which either discovers the exercise of that power to be contrary to law, or (if legal) restrains it for the future. This was the case in the present instance. The oppression of an obscure individual gave birth to the famous *habeas corpus* act, 31 Car. II. c. 2. which is frequently considered as another *magna carta* of the kingdom; and by consequence has also in subsequent times reduced the method of proceeding on these writs (though not within the reach of that statute, but issuing merely at the common law) to the true standard of law and liberty.

The statute itself enacts, 1. That the writ shall be returned and the prisoner brought up, within a limited time according to the distance, not exceeding in any case twenty days. 2. That such writs shall be endorsed, as granted in pursuance of this act, and signed by the person awarding them. 3. That on complaint and request in writing by or on behalf of any person committed and charged with any crime (unless committed for treason or felony expressed in the warrant, or for suspicion of the same, or as accessory thereto before the fact, or convicted or charged in execution by legal process), the lord chancellor, or any of the twelve judges in vacation, upon viewing a copy of the warrant, or affidavit that a copy is denied, shall (unless the party has neglected for two terms to apply to any court for his enlargement) award a *habeas corpus* for such prisoner, returnable immediately before himself or any other of the judges; and upon the return made shall discharge the party, if bailable, upon giving security to appear and answer to the accusation in the

proper court of judicature. 4. That officers and keepers neglecting to make due returns, or not delivering to the prisoner or his agent within six hours after demand a copy of the warrant of commitment, or shifting the custody of a prisoner from one to another without sufficient reason or authority (specified in the act), shall for the first offence forfeit 100 l. and for the second offence 200 l. to the party grieved, and be disabled to hold his office. 5. That no person, once delivered by *habeas corpus*, shall be re-committed for the same offence, on penalty of 500 l. 6. That every person committed for treason or felony shall, if he requires it the first week of the next term, or the first day of the next session of *oyer and terminer*, be indicted in that term or session, or else admitted to bail; unless the king's witnesses cannot be produced at that time: and if acquitted, or if not indicted and tried in the second term or session, he shall be discharged from his imprisonment for such imputed offence: but that no person, after the assizes shall be opened for the county in which he is detained, shall be removed by *habeas corpus*, till after the assizes are ended; but shall be left to the justice of the judges of assize. 7. That any such prisoner may move for and obtain his *habeas corpus*, as well out of the chancery or exchequer as out of the king's bench or common pleas; and the lord chancellor or judges denying the same, on sight of the warrant, or oath that the same is refused, forfeit severally to the party grieved the sum of 500 l. 8. That the writ of *habeas corpus* shall run into the counties palatine, cinque ports, and other privileged places, and the islands of Jersey and Guernsey. 9. That no inhabitant of England (except persons contracting, or convicted praying to be transported; or having committed some capital offence in the place to which they are sent) shall be sent prisoner to Scotland, Ireland, Jersey, Guernsey, or any places beyond the seas, within or without the king's dominions: on pain that the party committing, his advisers, aiders, and assistants, shall forfeit to the party grieved a sum not less than 500 l. to be recovered with treble costs; shall be disabled to bear any office of trust or profit; shall incur the penalties of *præmunire*; and shall be incapable of the king's pardon.

This is the substance of that great and important statute: which extends (we may observe) only to the case of commitments for such criminal charge as can produce no inconvenience to public justice by a temporary enlargement of the prisoner; all other cases of unjust imprisonment being left to the *habeas corpus* at common law. But even upon writs at the common law it is now expected by the court, agreeable to ancient precedents and the spirit of the act of parliament, that the writ should be immediately obeyed, without waiting for any *alias* or *pluries*; otherwise an attachment will issue. By which admirable regulations, judicial as well as parliamentary, the remedy is now complete for removing the injury of unjust and illegal confinement. A remedy the more necessary, because the oppression does not always arise from the ill-nature, but sometimes from the mere inattention, of government. For it frequently happens in foreign countries (and has happened in England during the temporary suspensions of the statute), that persons apprehended

Habeas
Corpus.

Haber-
dasher

Habit.

prehended upon suspicion have suffered a long imprisonment, merely because they were forgotten.

HABERDASHER, in commerce, a seller of hats and other small wares.—The master and wardens of the company of haberdashers in London, calling to their assistance one of the company of cappers, and another of the hat-makers, and mayors, &c. of towns, may search the wares of all hatters who work hats with foreign wool, and who have not been apprentices to the trade, or who dye them with any thing but copperas and galls, or woad and madder; in which cases they are liable to penalties by stat. 3. Eliz. cap. 7. and 5 Geo. II. cap. 22.

For the etymology of this denomination, see **BERDASH**.

HABERGION, or **HAUBERGEON**, **HABERGETUM**, a coat of mail; an ancient piece of defensive armour, in form of a coat, descending from the neck to the middle, and formed of little iron rings or mailles, linked into each other.—The word is also written *haberge*, *hauberge*, *haubere*, *haubert*, *hauther*, *boubert*, and *hauberk*. Spelman takes it to have been formed from the ancient French *haut*, “high,” and *berg*, “armour, covering;” as serving to defend the upper part of the body. Du Cange and Skinner choose to derive it from the Belgic *hals*, or Teutonic *halsz*, “neck,” and *bergen*, “to cover;” as if it were a peculiar defence for the neck. Others will have it formed of *al*, *alla*, q. d. *all*, and *bergen*, “to cover;” as importing it a cover for the whole body.

HABICOT (Nicholas), a celebrated surgeon, born at Bonny in Gatinois, acquired great reputation by his skill in his profession, and by his writings; and died in 1624. He wrote a treatise on the plague, and several other curious works.

HABINGTON (William), an English poet and historian, was the son of Thomas Habington, Esq. He was born in 1605, at Hendlip in Worcestershire; and was educated at St Omers and at Paris. He died in 1654, and left several manuscripts in the hands of his son. His printed works are, 1. Poems under the title of *Castura*. 2. The queen of Arragon, a tragic-comedy. 3. Observations upon History. 4. The history of Edward IV. king of England, written and published at the desire of Charles I. This work is composed in a very florid style.

HABIT, in philosophy, an aptitude or disposition either of mind or body, acquired by a frequent repetition of the same act. See *CUSTOM* and *HABIT*.

HABIT is also used for a dress or garb, or the composition of garments, wherewith a person is covered. The principal part of the dress worn by the Jews and Greeks was the *chiton* and the *chiton*. The *chiton* was an upper garment, consisting of a loose square piece of cloath wrapped round the body; the *chiton* was an under garment, or tunic, which was fastened round the body and embraced it closely, falling down to the mid-thigh. It is proper in this place to observe that a person divested of this upper garment or *chiton*, in the eastern language, is styled *naked*, and in this sense David danced naked before the ark.

The several sorts of garments in use with both sexes, amongst the Romans, were the toga, tunica, peluna, lacerna, chlamys, paludamentum, lana, stola, pallium or palla. See **TOGA**, &c.

For the habits of the priests amongst the Jews, Greeks, and Romans, see the article **PRIESTS**.

HABIT is particularly used for the uniform garments of the religious, conformable to the rule and order whereof they make profession: as the habit of St Benedict, of St Augustine, &c.

In this sense we say absolutely, such a person has taken the habit; meaning he has entered upon a noviciate in a certain order. So he is said to quit the habit, when he renounces the order. See **VOW**.

The habits of the several religious are not supposed to have been calculated for singularity or novelty: the founders of the orders, who were at first chiefly inhabitants of deserts and solitudes, gave their monks the habit usual among the country people. Accordingly, the primitive habits of St Anthony, St Hilarion, St Benedict, &c. are described by the ancient writers as consisting chiefly of sheep skins, the common dress of the peasants, shepherds, and mountaineers, of that time; and the same they gave to their disciples.

The orders established in and about cities and inhabited places took the habit worn by other ecclesiastics at the time of their institution. Thus, St Dominic gave his disciples the habit of regular canons, which he himself had always worn to that time. And the like may be said of the Jesuits, Barnabites, Theatins, Oratorians, &c. who took the common habit of the ecclesiastics at the time of their foundation. And what makes them differ so much from each other, as well as from the ecclesiastical habit of the present times, is, that they have always kept invariably to the same form; whereas the ecclesiastics and laies have been changing their mode on every occasion.

HABITE and **REPUTE**, in Scots law, the common opinion of the people, among whom a person lives, with respect to any circumstance relating to him.

HABITUDE, among schoolmen, the respect or relation one thing bears to another. See **RELATION**.

HABSBURG, or **HAPSBURG**, an ancient castle of Swisserland, in the canton of Bern. It is the place where the ancient counts of Hapsburg resided, and is seated near the lake of Lucern, and to the east of the town of that name. E. Long. 8. 10. N. Lat. 47. 22.

HACHA, a sea-port town of South America, in Terra Firma, seated at the mouth of a river of the same name. Here the Spanish galleons touch at their arrival in South America, from whence expresses are sent to all the settlements to give them notice of it. W. Long. 72. 8. N. Lat. 11. 30.

HACKET (John), bishop of Litchfield and Coventry, was born in 1592. In 1623, he was made chaplain to James I. and prebendary of Lincoln: and soon after obtained the rectory of St Andrew's Holborn, with that of Cheam in Surry; his patron telling him, he intended Holborn for wealth, and Cheam for health. In 1642 he was presented to a prebendary and residentiary; but was deprived of the enjoyment of them, as well as of St Andrew's, by the ensuing troubles. He then lived retired at Cheam with little disturbance, until he recovered his preferments by the restoration of Charles II. by whom he was preferred to the see of Litchfield and Coventry in 1661. Finding the beautiful cathedral of Litchfield almost battered to the ground,

Habit

Hacket.

Hackney. ground, he in eight years finished a complete church superior to the former, at his own expence of 20,000 l. excepting 1000 l. he had from the dean and chapter, with what he could procure from private benefactors. He laid out 1000 l. on a prebendal house, his palaces at Litchfield and Eccleshall having been demolished during the civil wars: and beside these acts of munificence, left several other benefactions at his death in 1670. He published, before he entered into orders, a comedy intitled *Loyola*, which was twice acted before king James I. After his death there appeared a "Century of his sermons on several remarkable subjects," in folio; and "The life of archbishop Williams," in folio, which was abridged in 1700 by Ambrose Philips.

HACKNEY, a parish of Middlesex, on the north-east side of London, containing no less than 12 hamlets. At the bottom of Hackney-Marsh, through which the river Lea runs, between Old-Ford and the Wyck, there have been discovered the remains of a great stone causeway, which, by the Roman coins, &c. found there, was no doubt one of the famous highways made by the Romans. The church here is of a very ancient foundation, so old as Edward II. and the number of houses near 800. That part next London is called *Mare Street*; the middle *Church Street*; and the north part *Clapton*; Dorleston and Shaklewell are on the west, and Hummerton, which leads to the Marsh, on the east. Here are three meeting-houses and several boarding-schools, besides the free-school in the church-yard, a charity-school, and 17 almshouses. It was from this place that the coaches let to the people in London first received their name; for in the last century, many people having gone on visits to see their friends at Hackney, it occasioned them often to hire horses or carriages, so that in time it became a common name for such horses, coaches, and chairs, as were let to the people of London; and the name has now diffused itself not only throughout Britain, but likewise Ireland.

HACKNEY-Coaches, those exposed to hire in the streets of London, and some other great cities, at rates fixed by authority. See **COACH**.—These first began to ply in the streets of London, or rather waited at inns, in the year 1625, and were only 20 in number; but in 1635 they were so much increased, that king Charles issued out an order of council for restraining them. In 1637, he allowed 50 hackney-coachmen, each of whom might keep 12 horses. In 1652, their number was limited to 200; and in 1654, it was extended to 300. In 1661, 400 were licensed, at 5 l. annually for each. In 1694, 700 were allowed, and taxed by the 5 and 6 of W. & M. at 4 l. *per annum* each. By 9 Anne cap. 23. 800 coaches were allowed in London and Westminster; but by 8 Geo. III. cap. 24. the number is increased to 1000, which are to be licensed by commissioners, and to pay a duty of 5 sh. per week to the king. On Sundays there were formerly only 175 hackney-coaches to ply, which were to be appointed by commissioners; but their number is now unlimited.

The fare of hackney coachmen in London, or within ten miles of the city, is 12 shillings and sixpence per day, allowing 12 hours per day. By the hour it is 1s. 6d. for the first, and 1s. for every hour after; and none are obliged to pay above 1s. for any distance not exceeding a mile and a half; or above 1s. 6d. for

any distance not exceeding two miles. Where hackney coachmen refuse to go at, or exact more than, their limited hire, they are subject to a forfeit not under 10s. nor exceeding 3 l. and which the commissioners have power to determine. Every hackney-coach must be provided with check strings, and every coachman plying without them incurs a penalty of 5s.—Drivers of hackney-coaches are to give way to persons of quality and gentlemens coaches, under the penalty of 5 l.

The duty arising from licences to hackney-coaches and chairs in London, forms a branch of the king's extraordinary and perpetual revenue *. This revenue is governed by commissioners of its own, and is in truth a benefit to the subject; as the expence of it is felt by no individual, and its necessary regulations have established a competent jurisdiction, whereby a very refractory race of men may be kept in some tolerable order. * See *Revenue*.

HADDINGTON, a borough-town of Scotland, in East Lothian, which, along with four others, sends one member to parliament. It is surrounded with many seats of nobility and gentry, and is about 16 miles east of Edinburgh. It is the county town, and gives title of Earl to a branch of the Hamilton family. W. Long. 2. 25. N. Lat. 55. 50.

HADDOCK, the English name of a species of **GADUS**.

HADDON (Dr Walter), a great restorer of the learned languages in England, was born in 1516. He distinguished himself particularly by writing Latin in a fine style, which he acquired by a constant study of Cicero. He was a strenuous promoter of the reformation under king Edward; and was therefore thought a proper person to succeed bishop Gardiner in the mastership of Trinity-hall, Cambridge, on his deprivation. He lay concealed during the reign of queen Mary; but acquired the favour of Elizabeth, who constituted him one of the masters of the court of requests, and sent him one of the three agents to Bruges in 1566, to restore commerce between England and the Netherlands. He was also engaged with Sir John Cheke in drawing up in Latin that useful code of ecclesiastical law, published in 1571 by the learned John Fox, under the title of *Reformatio legum ecclesiasticarum*; his other works are collected and published under the title of *Lucubrations*. He died in 1572.

HADERSLEBEN, a sea-port town of Denmark, in the duchy of Sleswick, with a strong citadel, built upon a small island. It is seated on a bay of the Baltic Sea, and has a well-frequented harbour. E. Long. 9. 35. N. Lat. 55. 24.

HADES, in the scriptures, is used in various senses. Sometimes it signifies the invisible regions of the dead, sometimes the place of the damned, and sometimes the grave. In Greek authors it is used to signify in general the regions of the dead. See **HELL**.

HADLEY, a town of Suffolk, seated in a bottom on the river Preston. It consists of about 600 houses; with a very handsome church, a chapel of ease, and a Presbyterian meeting-house. The streets are pretty broad, but not paved. Large quantities of yarn are spun here for the Norwich manufacture; and this town had once a considerable woollen manufacture, which is now decayed. E. Long. 1. 0. N. Lat. 52. 7.

pus.

medicine, consisting of fetid and aromatic simples mixed with black hellebore, and prescribed in order to promote the menstua and hæmorrhoidal fluxes; as also to bring away the lochia.

HÆMANTHUS, the BLOOD-FLOWER: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the ninth order, *Spathaceæ*. The involucre is hexaphyllus and multiflorous; the corolla sexpartite superior; the berry trilocular.

Species. 1. The coccineus, with plain tongue-shaped leaves, rises about a foot high, with a stalk supporting a cluster of bright red tubulous flowers. It hath a large bulbous root, from which in the autumn comes out two broad flat leaves of a fleshy consistence, shaped like a tongue, which turn backward on each side, and spread on the ground, so that they have a strange appearance all the winter. In the spring these decay; so that from May to the beginning of August they are destitute of leaves. The flowers are produced in the autumn just before the leaves come out. 2. The carinatus, with keel-shaped leaves, has a taller stalk and paler flowers than the former; its leaves are not flat, but hollowed like the keel of a boat. 3. The puniceus, with large spear-shaped waved leaves, grows about a foot high, and hath flowers of a yellowish red colour. These are succeeded by berries, which are of a beautiful red colour when ripe.

Culture. All these plants are natives of the Cape of Good Hope, and do not propagate very fast in Europe, their roots seldom putting forth many off-sets. The best method of managing them is to have a bed of good earth in a bricked pit, where they may be covered with glasses, and in hard frosts with mats and straw. The earth in the frame should be two feet deep, and the frame should rise two feet above the surface, to allow height for the flower-stems to grow. The roots should be planted nine or ten inches asunder; and in winter, if they are protected from frost, and not suffered to have too much wet, but in mild weather exposed to the air, they will flower every year, and the flowers will be much stronger than with any other management. The third sort requires to be constantly kept in a dry stove.

HÆMATITES, or BLOOD-STONE, a hard mineral substance, red, black, or purple, but the powder of which is always red. It is found in masses sometimes spherical, semi-spherical, pyramidal, or cellular, that is like a honeycomb. It contains a large quantity of iron. Forty pounds of this metal have been extracted from a quintal of stone; but the iron is of such a bad quality, that this ore is not commonly smelted. The great hardness of hæmatites renders it fit for burnishing and polishing metals.

HÆMATOPUS, the SEA-PYE, in ornithology, a genus belonging to the order of grallæ. The beak is compressed, with an equal wedge-shaped point; the nostrils are linear; and the feet have three toes without nails. There is but one species, viz. the ostralegus, or oyster-catcher, a native of Europe and America. It feeds upon shell-fish near the sea-shore, particularly oysters, and limpets. On observing an oyster which gapes wide enough for the insertion of its bill, it thrusts it in, and takes out the inhabitant: it will also force the limpets from their

adhesion to the rocks with sufficient ease. In turn it feeds on marine insects and worms. With us these birds are often seen in considerable flocks in winter: in the summer they are met with only in pairs, though chiefly in the neighbourhood of the sea or salt rivers. The female lays four or five eggs, on the bare ground, on the shore, above high-water mark: they are of a greenish grey, blotched with black. The young are said to be hatched in about three weeks. These birds are pretty wild when in flocks; yet are easily brought up tame, if taken young.

HÆMATOXYLUM, LOGWOOD, or *Campeachy Wood*: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 33d order, *Lomentaceæ*. The calyx is quinquepartite; the petals five; the capsule lanceolated; unilocular, and bivalved; the valves navicular or keeled like a boat.

Of this genus there is only one species, viz. the campechianum, which grows naturally in the bay of Campeachy at Honduras, and other parts of the Spanish West Indies, where it rises from 16 to 24 feet high. The stems are generally crooked, and very deformed; and seldom thicker than a man's thigh. The branches, which come out on each side, are crooked, irregular, and armed with strong thorns, garnished with winged leaves, composed of three pair of obscure lobes indented at the top. The flowers come in a racemus from the wings of the leaves, standing erect, and are of a pale yellowish colour, with a purple empalement. They are succeeded by flat oblong pods, each containing two or three kidney-seeds.—Dr Wright informs us, that this tree was introduced into Jamaica from Honduras in 1715; and is at this time too common, as it has overrun large tracts of land, and is very difficult to root out. It makes a beautiful and strong fence against cattle. If pruned from the lower branches, it grows to a sizeable tree, and, when old, the wood is as good as that from Honduras. The trees are cut up into billets or junks, the bark and white sap of which are chipped off, and the red part, or heart, is sent to England for sale.

Logwood is used in great quantities for dyeing purple, but especially black colours. All the colours, however, which can be prepared from it, are of a fading nature, and cannot by any art be made equally durable with those prepared from some other materials. Of all the colours prepared from logwood, the black is the most durable. Dr Lewis recommends it as an ingredient in making ink. “In dyeing cloth (says he), vitriol and galls, in whatever proportions they are used, produce only browns of different shades: I have often been surprised that with these capital materials of the black dye I never could obtain any true blackness in white cloth, and attributed the failure to some unheeded mismanagement in the process, till I found it to be a known fact among the dyers. Logwood is the material which adds blackness to the vitriol and gall-brown; and this black dye, though not of the most durable kind, is the most common. On blue cloth a good black may be dyed by vitriol and galls alone; but even here, an addition of logwood contributes not a little to improve the colour.”—Mr Delaval, however, in his Essay on Colours, informs us, that with an infusion of galls and iron-filings, he not only made an exceeding

Hæma-
toxylum.

Hæmoptysis.

exceeding black and durable ink, but also dyed linen cloth of a very deep black. See *COLOUR-Making*, n° 12, 13, 14.; *DYEING*, n° 17.; and *INK*. Logwood is also found to have a considerable astringent virtue as a medicine, and an extract of it is sometimes given with great success in diarrhoeas.

HÆMOPTYSIS, *HÆMPTYSIS*, or *Hæmoptoe*; a spitting of blood. See (*Index* subjoined to) *MEDICINE*.

HÆMORRHAGY, (compounded of *αἷμα* "blood," and *ρῆσις* "I burst forth,") in medicine, a flux of blood at any part of the body; arising either from a rupture of the vessels, as when they are too full or too much pressed; or from an erosion of the same, as when the blood is too sharp and corrosive.—The hæmorrhagy, properly speaking, as understood by the Greeks, was only a flux of blood at the nose; but the moderns extend the name to any kind of flux of blood, whether by the nose, mouth, lungs, stomach, intestines, fundament, matrix, or whatever part. See *MEDICINE* and *SURGERY*.

HÆMORRHOIDAL, an appellation given by anatomists to the arteries and veins going to the *intestinum rectum*.

HÆMORRHOIDS, or *PILES*, an hæmorrhage or issue of blood from the hæmorrhoidal vessels. See (*Index* subjoined to) *MEDICINE*.

HÆMUS, (anc. geog.), a vast ridge, running from Illyricum towards the Euxine, (Pliny); so high as to afford a prospect both of the Euxine and Adriatic. Here, in after ages, was constituted a province called *Hæmimons*, or *Hæmimontus*.

HÆRETICO COMBURENDO, a writ which anciently lay against an heretic, who, having once been convicted of heresy by his bishop, and having abjured it, afterwards falling into it again, or into some other, is thereupon committed to the secular power. This writ is thought by some to be as ancient as the common law itself; however, the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop himself in a provincial synod, and the delinquent was delivered up to the king to do with him as he pleased: so that the crown had a control over the spiritual power. But by 2 Hen. IV. cap. 15. the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. This writ remained in force, and was actually executed on two Anabaptists in the seventh of Elizabeth, and on two Arians in the ninth of James I.—Sir Edward Coke was of opinion, that this writ did not lie in his time; but it is now formally taken away by statute 29 Car. II. cap. 9. But this statute does not extend to take away or abridge the jurisdiction of Protestant archbishops or bishops, or any other judges of any ecclesiastical courts, in cases of atheism, blasphemy, heresy, or schism, and other damnable doctrines and opinions; but they may prove and punish the same according to his majesty's ecclesiastical laws, by excommunication, deprivation, degradation, and other ecclesiastical censures, not extending to death, in such sort and no

N° 147.

other, as they might have done before the making of this act. Sec. 2. See *HERESY*.

HAERLEM. See *HARLEM*.

HAG, in zoology. See *MYKINE*.

HAGARENS, the descendants of Ishmael. They are called also *Ishmaelites* and *Saracens*; and lastly, by the general name of *Arabians*.

As to the Hagarens, they dwelt in Arabia the Happy, according to Pliny. Strabo joins them with the Nabathæans, and Chavlotæans, whose habitation was rather in Arabia Deserta. Others think their capital was Petra, otherwise Agra, and consequently they should be placed in Arabia Petræa. The author of the *lxxxiii. Psalm*, ver. 6. joins them with the Moabites; and in the *Chronicles* it is said (1 Chr. v. 10.), that the sons of Reuben, in the time of Saul, made war against the Hagarens, and became masters of their country eastward of the mountains of Gilead. This therefore was the true and ancient country of the Hagarens. When Trajan came into Arabia, he besieged the capital of the Hagarens, but could not take it. The sons of Hagar valued themselves of old upon their wisdom, as appears by Baruch iii. 23.

HAGEDORN (Frederick de), a celebrated German poet, was born at Hamburg, where his father was resident for the king of Denmark, in 1708. He finished his studies at Jena; and, in 1728, published a number of poetical pieces in Germany, which were well received. He afterwards came to England, where he obtained the friendship of many of the learned; and, at his return, was made secretary to the English Hamburg company, a lucrative employment that left him sufficient time for cultivating the muses. In 1738, he published his *Fables and Tales*, the first collection of the kind of which Germany can boast. He afterwards published other pieces of poetry of different kinds, as Moral Poems, Epigrams, and five books of Songs: which of all his poetical pieces are most esteemed. He died in 1754.

HAGENAU, a town of Germany, and capital of a bailiwick of the same name, which was formerly imperial, but now belongs to the French. It was taken by them in 1673; the Imperialists retook it in 1702; after which it was several times taken and retaken by both parties; but at last the French got possession of it in 1706. It is divided by the river Motter into two parts; and is seated near a forest of its own name, in E. Long. 7. 53. N. Lat. 48. 49.

HAGGAI, the tenth of the small prophets, was born, in all probability, at Babylon, in the year of the world 3457, from whence he returned with Zerubbabel. It was this prophet who by command from God (*Ezra* v. 1, 2, &c.) exhorted the Jews, after their return from the captivity, to finish the rebuilding of the temple, which they had intermitted for 14 years. His remonstrances had their effect; and to encourage them to proceed in the work, he assured them from God, that the glory of this latter house should be greater than the glory of the former house; which was accordingly fulfilled, when Christ honoured it with his presence: for with respect to the building, this latter temple was nothing in comparison of the former.

We know nothing certain of Haggai's death. The Jews pretend, that he died in the last year of the reign

Haerlem

||

Haggai.

Hagiogra-
phia,
Hague.

reign of Darius, at the same time with the prophets Zechariah and Malachi, and that thereupon the spirit of prophecy ceased among the children of Israel. Epiphanius will have it, that he was buried at Jerusalem among the priests. The Greeks keep his festival on the 16th of December, and the Latins on the 4th of July.

HAGIOGRAPHIA, a name given to part of the books of scripture, called by the Jews *Cetuvim*. The word is compounded of *αγιος* "holy;" and *γραφω* "I write." The name is very ancient: St Jerom makes frequent mention of it: before him, St Epiphanius called these books simply *Γραφια*.

The Jews divide the sacred writings into three classes: The Law, which comprehends the five books of Moses: The Prophets, which they call *Neviim*: And the *Cetuvim* כְּתוּבִים, called by the Greeks, &c. *Hagiographa*; comprehending the book of Psalms, Proverbs, Job, Daniel, Ezra, including also the book of Nehemiah, Chronicles, Canticles, Ruth, the Lamentations, Ecclesiastes, and Esther.

The Jews sometimes call these books the *Writings*, by way of eminence, as being written by immediate inspiration of the Holy Spirit. Thus says Kimchi, in his preface to the Psalms, Maimonides in *More Nevoch*, and Elias Levita in his *Thisbi*, under the word כְּתוּבִים.

They distinguish the hagiographers, however, from the prophets; in that the authors of the former did not receive the matters contained in them by the way called *Prophecy*, which consists in dreams, visions, whippers, ecstasies, &c. but by mere inspiration and direction of the Spirit.

HAGUE, a town of the United Provinces, in Holland, situated in E. Long. 4. 10. N. Lat. 48. 49. —In Latin it is called *Haga Comitum*; in French, *La Haye*; in Dutch, *der Haag*, or *'S-Graavenhage*, i. e. the Earl's Grove or Wood, from the wood near which it is built, and in which the earls of Holland had a country-house. Though it sends no deputies to the states, it is one of the most considerable towns in Holland, pleasantly situated, and exceeding beautiful. It may indeed compare with almost any city in Europe, though geographers account it but a village. The inhabitants also breathe a better air than those of the other cities, as it stands on a dry soil, somewhat higher than the rest of the country. It has no gates or walls, but is surrounded by a moat over which there are many draw-bridges. Two hours are required to walk round it, and it contains about 40,000 or 50,000 souls. It is a place of much splendor and business, being the seat of the high colleges of the republic and province of Holland, and the residence of the stadtholder and foreign ambassadors; and there are a great many fine streets and squares in it. In the inner court all the high colleges and courts of justice hold their assemblies: there also the foot-guards do duty, as the horse-guards in the outer, when the states are sitting. De Plaats is an open airy place, in form of a triangle, adorned with neat and beautiful buildings: the Vyverberg is an eminence, laid out into several fine shady walks, with the Vyver, a large basin of water, at the bottom: the Voorhout is the most celebrated part of the Hague, and consists of the mall, and three ways for coaches on each side, planted with trees, being much the same as St James's park at Lon-

VOL. VIII. Part I.

don: the palace of Opdam, or Wassenaar, is built in a very elegant taste: the prince and princess grafts are fine streets: the plan, in Dutch *Het Pleyn*, is a beautiful grove, laid out in several cross walks, and surrounded with stately houses. The Jewish synagogue is well worth being seen by a curious traveller; and also the palaces of the prince of Orange, the hotel of Spain, the new Woorhout, the mausoleum of the baron of Opdam in the great church, and the several hospitals. The environs of the Hague are exceedingly pleasant. Among other agreeable objects are the wood, with the palace of Orange at the extremity of it, called the *house in the wood*; the village of Scheveling; and the sand-hills along the north sea; with the village of Voorburg, and the charming seats and fine gardens round it. Two miles from the Hague is Ryswick, a village: and, a quarter of a mile from that, a noble palace belonging to the prince of Orange, famous for the treaty of peace concluded there in 1697. Loosduynen, where Margaret, countess of Henneburg, and daughter of Florence IV. count of Holland and Zealand, is said to have been delivered of 365 children at a birth in 1276, is about five miles from the Hague. Five miles beyond Loosduynen, and not far from the beautiful village of Gravesande, is Honstardyck, another palace belonging to the prince of Orange, and one of the finest structures in the Low Countries.

HAHN (Simon Frederick), a celebrated German historian. At ten years of age he was not only far advanced in the Latin, but understood several living languages. Four years after, he pronounced a speech on the origin of the cloyster at Bergen, the place of his birth, which was printed with some other pieces; and in 1708 he published a Continuation of Meibomius's Chronicle of Bergen. After having for several years given public lectures at Hall, he became, at the age of 24, professor of history at Helmstadt; and was at length counsellor, historiographer, and librarian, to the king of Great Britain, elector of Hanover. He died in 1729, aged 37.—Besides the above, and some other works, he wrote, 1. The first volume of the History of the Empire. 2. *Collectio monumentorum veterum et recentium ineditorum*, 2 vols 8vo.

HAI-NAN. See HAINAN.

Hai-Tang, a beautiful Chinese shrub, originally brought from the bottom of the rocks which border the sea-coast. It has been cultivated in China for more than 14 centuries; and is celebrated as often in the works of the Chinese poets, as roses and lilies are in those of ours. Painters and embroiderers ornament almost all their works with its foliage and flowers. The stalk of the hai-tang is of a cylindric form, and shoots forth a number of branches of a purple tint towards their bases, and full of knots, which are also of a purple colour round the edges. It produces a number of shoots, the tallest of which are about two feet and a half in height. Its leaves (which are much indented, of an oval form towards the stalk, pointed at their upper extremities, and full of small prickles) grow almost opposite one another on the branches, and at the same distance as the knots. Their colour above is a deep-green; that below is much lighter, and almost effaced by their fibres, which are large, and of a delicate purple: all these leaves together have a beau-

K k

tiful

Hahn
Hai-Tang.

Hai-Tang, tiful effect to the eye. The flowers grow in bunches at the extremities of the branches. Each flower is composed of four petals, two great and two small, resembling in colour the bloom of a peach-tree, and which have almost the same figure as the blossom of our cherry-trees. The two large are cemented one upon the other, in the form of a purse; and when they blow, the two small blow also in their turn; and then the whole four represent a cross. The pistil is composed of very bright yellow grains, which separate gradually one from another by the lengthening of the filaments to which they adhere; they then open into little bells, and compose a small yellow tuft, supported by a slender stalk, which rises above the petals. The calyx, which sustains each of the flowers, is composed of two purple-coloured leaves, united in form of a purse. In proportion as the flowers grow and increase in size, the two leaves of the calyx open, become pale and dry, and drop off. The flowers, supported by small stalks, separate one from the other, and produce of themselves other flowers, which rise up from a new calyx.

This plant is propagated from seed, but with difficulty. It thrives best in a sandy soil; dung or mould destroy it; and great care must be taken to refresh it only with the purest water. As it cannot endure the sun in any season, it is always planted below walls that are exposed to the north. It generally begins to flower about the end of August. After it has produced seed, all its branches are cut; and it commonly shoots forth new ones before the spring following; but it is necessary to heap up gravel and pieces of brick round its roots, to prevent them from rotting. Notwithstanding all the care that is taken to cultivate this tree at Peking, it does not thrive so well there as in the southern provinces. The smell of its leaves has an affinity both to that of the rose and the violet; but it is weaker, and never extends to any great distance.

HAIL, in natural history, a meteor generally defined frozen rain, but differing from it in that the hailstones are not formed of single pieces of ice, but of many little spherules agglutinated together. Neither are these spherules all of the same consistence; some of them being hard and solid like perfect ice; others soft, and mostly like snow hardened by a severe frost. Sometimes the hailstone hath a kind of core of this soft matter; but more frequently the core is solid and hard, while the outside is formed of a softer matter. Hailstones assume various figures, being sometimes round, at other times pyramidal, crenated, angular, thin, and flat, and sometimes stellated, with six radii like the small crystals of snow.

Natural historians furnish us with various accounts of surprising showers of hail, in which the hailstones were of extraordinary magnitude. Mezeray, speaking of the war of Louis XII. in Italy, in the year 1510, relates, that there was for some time an horrible darkness, thicker than that of night; after which the clouds broke into thunder and lightning, and there fell a shower of hailstones, or rather (as he calls them) pebble-stones, which destroyed all the fish, birds, and beasts of the country.—It was attended with a strong smell of sulphur; and the stones were of a bluish colour, some of them weighing an hundred pounds. *Hist. de France*, Tom. II. p. 339.

At Lisle in Flanders, in 1686, fell hailstones of a very large size; some of which contained in the middle a dark brown matter, which, thrown on the fire, gave a very great report. *Phil. Transf.* N° 203.

Dr Halley and others also relate, that in Cheshire, Lancashire, &c. April 29, 1697, a thick black cloud, coming from Carnarvonshire, disposed the vapours to congeal in such a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progress for the space of 60 miles, it did inconceivable damage; not only killing all sorts of fowls and other small animals, but splitting trees, knocking down horses and men, and even ploughing up the earth; so that the hailstones buried themselves under ground an inch or an inch and a half deep. The hailstones, many of which weighed five ounces, and some half a pound, and being five or six inches about, were of various figures; some round, others half round; some smooth, others embossed and crenated: the icy substance of them was very transparent and hard, but there was a snowy kernel in the middle of them.

In Hertfordshire, May 4. the same year, after a severe storm of thunder and lightning, a shower of hail succeeded, which far exceeded the former: some persons were killed by it, their bodies beat all black and blue; vast oaks were split, and fields of rye cut down as with a scythe. The stones measured from 10 to 13 or 14 inches about. Their figures were various, some oval, others picked, some flat. *Philosoph. Transf.* N° 229.

It is remarkable, that, so far as we know, hail is a meteor which never produces any beneficial effect. The rain and dew invigorate and give life to the whole vegetable tribe; the frost, by expanding the water contained in the earth, pulverises and renders the soil fertile; snow covers and preserves the tender vegetables from being destroyed by too severe a frost. But hail does none of all these. In winter, it lies not sufficiently close to cover vegetables from the nipping frosts; and in spring and summer it not only has a chilling and blasting effect from its coldness, but often does great damage to the more tender plants by the weight of the stones, and in great hail-storms the damage done in this manner is prodigious.

Hail is one of the natural phenomena for which it is almost impossible to account in any satisfactory manner. It is certain, that on the tops of mountains hailstones, as well as drops of rain, are very small, and continually increase in bulk till they reach the lower grounds. It would seem, therefore, that during their passage through the air, they attract the congealed vapour which increases them in size. But here we are at a loss how they come to be solid hard bodies, and not always soft, and composed of many small stars like snow. The flakes of snow, no doubt, increase in size as they descend, as well as the drops of rain or hailstones; but why should the one be in soft crystals, and the other in large hard lumps, seeing both are produced from congealed vapour? Some modern philosophers ascribe the formation of hail to electricity. Signior Beccaria supposes hail to be formed in the higher regions of the air, where the cold is intense, and where the electric matter is very copious. In these circumstances, a great number of particles of water are brought near together,

Hailing
Hainan.

ther, where they are frozen, and in their descent collect other particles, so that the density of the substance of the hailstone grows less and less from the centre; this being formed first in the higher regions, and the surface being collected in the lower. Agreeable to this, it is observed, that, in mountains, hail-stones, as well as drops of rain, are very small, there being but little space through which they can fall and increase their bulk. Drops of rain and hail also agree in this, that the more intense the electricity that forms them, the larger they are. Motion is known to promote freezing, and so the rapid motion of the electrified clouds may produce that effect. A more intense electricity also, he thinks, unites the particles of hail more closely than the more moderate electricity does those of snow. In like manner we see thunder-clouds more dense than those that merely bring rain; and the drops of rain are larger in proportion, though they fall not from so great a height.

HAILING, the salutation or accosting of a ship at a distance, either at sea, or in a harbour. The usual expression is, "Hoa, the ship ahoy!" To which she answers, "Holloa! Whence came ye? Where are ye bound? Good voyage! What cheer? All well! How fare ye?" &c.

HAILLAN (Bernard de Girard, lord of), a celebrated French historian. After having made some figure in the literary world, and as a translator, he applied himself to history with such success, that in 1571, Charles IX. made him historiographer of France. His history of France extends from Pharamond to the death of Charles VII. and is the first complete history of that kingdom composed in the French tongue. He was honoured by Henry III. with several marks of favour; and proposed to continue his history to the reign of Henry IV. but did not perform his promise. He died at Paris in 1610.

HAIMSUCKEN. See **HAMESECKEN**.

HAINAN, a considerable island of Asia, situated in between 18° and 20° N. Lat. It is subject to China, and belongs to the province of Quang-ton. It has on the north the province of Quang-li; on the south the channel formed between the bank Paracel and the eastern coast of Cochinchina; on the west, the same kingdom and part of Tong-king; and on the east, the Chinese sea. Its extent from east to west is between 60 and 70 leagues, and from north to south 45; this island therefore is about 160 leagues in circumference. Kiun-tcheou-fou, its capital, stands on a promontory, and ships often anchor at the bottom of its walls. Two different kinds of mandarins command here, as in all the other provinces of China: the first are called *literati*; the second, *mandarins of arms*, or military officers. Its jurisdiction extends over three cities of the second class and ten of the third. The greater part of the island is under the dominion of the emperor of China; the rest is independent, and inhabited by a free people, who have never yet been subdued. Compelled to abandon their plains and fields to the Chinese, they have retreated to the mountains in the centre of the island, where they are sheltered from the insults of their neighbours.

These people formerly had a free and open correspondence with the Chinese. Twice a year they exposed, in an appointed place, the gold which they dug

from their mines, with their eagle-wood and calamba, so much esteemed by the Orientals. A deputy was sent to the frontiers, to examine the cloths and other commodities of the Chinese, whose principal traders repaired to the place of exchange fixed on; and after the Chinese wares were delivered, they put into their hands with the greatest fidelity what they had agreed for. The Chinese governors made immense profits by this barter.

The emperor Kang-hi, informed of the prodigious quantity of gold which passed through the hands of the mandarins by this traffic, forbade his subjects, under pain of death, to have any communication with these islanders: however, some private emissaries of the neighbouring governors still find the means of having intercourse with them; but what they get at present by this clandestine trade is little, in comparison of that which they gained formerly. The natives of this island are very deformed, small of stature, and of a copper colour: both men and women wear their hair thrust through a ring on their forehead; and above they have a small straw-hat, from which hang two strings that are tied under the chin. Their dress consists of a piece of black or dark-blue cotton cloth, which reaches from the girdle to their knees: the women have a kind of robe of the same stuff, and mark their faces from the eyes to the chin with blue stripes made with indigo.

Among the animals of this island are a curious species of large black apes, which have the shape and features of a man; they are said to be very fond of women: there are also found here crows with a white ring round their necks; starlings which have a small crescent on their bills; black-birds of a deep blue colour, with yellow ears rising half an inch; and a multitude of other birds, remarkable for their colour or song. Besides mines of gold and lapis lazuli, which enrich the island of Hainan, it produces in abundance various kinds of curious and valuable wood. The predecessor of the present emperor caused some of it to be transported to Peking, at an immense expence, to adorn an edifice which he intended for a mausoleum. The most valuable is called by the natives *hoali*, and by the Europeans *rose* or *violet wood* from its smell; it is very durable, and of a beauty which nothing can equal; it is therefore reserved for the use of the emperor.

Hainan, on account of its situation, riches, and extent, deserves to be ranked among the most considerable islands of Asia. Not far from thence is another small island, commonly called *San-cian*. It is celebrated by the death of St Francis Xavier: his tomb is still to be seen on a small hill, at the bottom of which is a plain covered on one side with wood, and on the other ornamented with several gardens. This island is not a desert, as some travellers have pretended: it contains five villages; the inhabitants of which are poor people, who have nothing to subsist on but rice and the fish which they catch.

HAINAULT, a province of the Netherlands, belonging partly to France and partly to the house of Austria. It is bounded to the south by Champagne and Picardy; to the north by Flanders; to the east by the duchy of Brabant, the county of Namur, and the bishopric of Liege; and to the west by Artois and

Hainan,
Hainault.

Hainault,
Hair.

Flanders. Its extent from north to south is about 45 miles, and about 48 from east to west. The air is pleasant and temperate, and the soil fruitful: it abounds in rich pastures, corn-fields, woods, and forests, coal, iron, lead, beautiful marble, slate, and other useful stones: it is well watered by rivers and lakes, and breeds abundance of black cattle, and sheep whose wool is very fine. Its principal rivers are the Schelde, the Selle, and the Dender. This province is reckoned to contain 24 walled towns, 950 villages, one duchy, and several principalities, earldoms, peerdoms, and baronies. The abbeyes in it are 27. For spiritual matters, the greater part of it is subject to the archbishop of Cambray, and the rest to the bishops of Liege and Arras. The states of the province consist of the clergy, nobility, and commoners. The clergy are the abbots, deputies of the chapters, and rural deans; but the chapters of St Waudru and St Germain, in Mons, send no deputies, as they contribute nothing to the public taxes. The nobility consist of the earls and barons, and all those who by their birth have a right to a seat in the assembly of the states. The commoners are composed of the deputies of the towns. The clergy in this county are uncommonly rich. The states meet only when they are summoned by the sovereign; but there is a standing committee at Mons which meets weekly. This county had counts of its own, till the year 1436; when Philip the Good, duke of Burgundy, arrived to the possession of it, upon the death of Jaqueline, the heiress, without issue. The French acquired that part of it which they possess, partly by the peace of the Pyrenees, and partly by those of Nimeguen and Reswick. The arms of this county are quartered, and contain four lions, in a field *or*. For the government of it, there is a sovereign council, at the head of which is the high bailiff, who has very great authority; he represents the sovereign, is governor of Mons, and captain-general of the province.

* See *Anatomy*, n° 82.

HAIR, small filaments issuing out of the pores of the skins of animals; and serving most of them as a tegument or covering *. In lieu of hair, the nakedness of some animals is covered with feathers, wool, scales, &c.

Hair is found on all parts of the human body, except the soles of the feet and the palms of the hands.—But it grows longest on the head, chin, breast, in the arm-pits, and about the privities.

The ancients held the hair a sort of excrement, fed only with excrementitious matters, and no proper part of a living body.—They supposed it generated of the fuliginous parts of the blood, exhaled by the heat of the body to the surface, and there condensed in passing through the pores.—Their chief reasons were, that the hair being cut, will grow again apace, even in extreme old age, and when life is very low: that in hectic and consumptive people, where the rest of the body is continually emaciating and attenuating, the hair shall thrive: nay, and that it will grow again in dead carcases.—They added, that hair does not feed and grow like the other parts, by intromission, *i. e.* by a juice circulating within it; but, like the nails, by juxtaposition, each part next the root thrusting forward that immediately before it.

But the moderns are agreed, that every hair does

properly and truly live, and receive nutriment to fill and distend it like the other parts: which they argue hence, that the roots do not turn grey in aged persons sooner than the extremities, but the whole changes colour at once, and the like is observed in boys, &c.; which shows that there is a direct communication, and that all the parts are affected alike.

It may be observed, however, that, in propriety, the life and growth of hairs is of a different kind from that of the rest of the body; and is not immediately derived therefrom, or reciprocated therewith. It is rather of the nature of vegetation. They grow as plants do out of the earth; or as some plants shoot from the parts of others; from which though they draw their nourishment, yet each has, as it were, its several life and a distinct economy. They derive their food from some juices in the body, but not from the nutritious juices of the body; whence they may live, tho' the body be starved.—Wulferus, in the *Philosophical Collections*, gives an account of a woman buried at Norimberg, whose grave being opened 43 years after her death, there was hair found issuing forth plentifully through the clefts of the coffin; insomuch, that there was reason to imagine the coffin had some time been covered all over with hair. The cover being removed, the whole corps appeared in its perfect shape; but, from the crown of the head to the sole of the foot, covered over with a thick-set hair, long and curled. The sexton going to handle the upper part of the head with his fingers, the whole structure fell at once, leaving nothing in his hand but an handful of hair: there was neither skull nor any other bone left; yet the hair was solid and strong enough.—Mr Arnold, in the same collection, gives a relation of a man hanged for theft, who, in a little time, while he yet hung upon the gallows, had his body strangely covered over with hair.—Some moderns, however, deny the authenticity of these and other similar instances.

The hairs ordinarily appear round or cylindrical; but the microscope also discovers triangular and square ones; which diversity of figure arises from that of the pores, to which the hairs always accommodate themselves. Their length depends on the quantity of the proper humour to feed them, and their colour on the quality of that humour: whence, at different stages of life, the colour usually differs. Their extremities split into two or three branches, especially when kept dry, or suffered to grow too long; so that what appears only a single hair to the naked eye, seems a brush to the microscope.

The hair of a mouse, viewed by Mr Derham with a microscope, seemed to be one single transparent tube, with a pith made up of fibrous substances, running in dark lines, in some hairs transversely, in others spirally. The darker medullary parts or lines, he observes, were no other than small fibres convolved round, and lying closer together than in the other parts of the hair. They run from the bottom to the top of the hair; and he imagines, may serve to make a gentle evacuation of some humour out of the body. Hence the hair of hairy animals, this author suggests, may not only serve as a fence against cold, &c. but as an organ of insensible perspiration.

Though the external surface of the body is the natural place for hairs, we have many well-attested instances

Hair.

Hair.

stances of their being found also on the internal surface. Amatus Lusitanus mentions a person who had hair upon his tongue. Pliny and Valerius Maximus concur in their testimonies, that the heart of Aristomenes the Messenian was hairy. Cælius Rhodiginus relates the same of Hermogenes the rhetorician; and Plutarch, of Leonidas the Spartan.—Hairs are said to have been frequently found in the breasts of women, and to have occasioned the distemper called *trichiasis*; but some authors are of opinion, that these are small worms and not hairs. There have been, however, various and indisputable observations of hairs found in the kidneys, and voided by urine.

Hippocrates is of opinion, that the glandular parts are the most subject to hair; but bundles of hair have been found in the muscular parts of beef, and in such parts of the human body as are equally firm with that.—Hair has been often found in abscesses and imposthumations. Schultetus, opening the abdomen of a woman, found 12 pints of water, and a large lock or bundle of hair swimming loose in it. But of all the internal parts, there is none so much subject to an unnatural growth of hair as the ovaries of females, and that as well of the human species as of other animals. Of this Dr Tyson relates three remarkable instances; two of these were young women, and the other was a bitch. The animal had been much emaciated in its hinder parts; the hair was about an inch and an half long; but the most remarkable particular was, that hair was also found lying loose in the cavities of the veins. We have several instances of mankind being affected in the same manner. Cardan relates, that he found hair in the blood of a Spaniard; and Slonatus in that of a gentlewoman of Cracovia; and Schultetus declares from his own observation, that those people who are afflicted with the *plica polonica*, have very often hair in their blood.

Diseases of the Hair. Almost the only disease of the hair, besides the remarkable one called *plica polonica*, is its falling off, or *baldness*. For this many remedies have been recommended, but scarce any of them can be depended upon. The juice of burdock, and the lixivial salts of vine-ashes, are said to be efficacious; also the powder of hermodactyls, and the decoction of boxwood. A remarkable instance of the efficacy of this last is given under the article *Buxus*.—Some authors give instances of the hair changing its colour in a short time, through grief, or by reason of a fright, &c.

HAIR as an Ornament, or as an Ensign of Dignity or of Religion. By the Jews hair was worn naturally long, just as it grew; but the priests had theirs cut every fortnight, while they were in waiting at the temple; they made use of no razors, however, but scissars only. The Nazarites, while their vow continued, were forbidden to touch their heads with a razor. See NAZARITE.

The falling of the hair, or a change of its colour, was regarded amongst the Hebrews as a sign of the leprosy. Black hair was esteemed by them as the most beautiful. Absalom's hair was cut once a-year, and is said to have weighed 200 shekels, by the king's weight, which is about 31 ounces. The law of God hath left no particular ordinances with respect to the hair.

Hair.

The hair of both Jewish and Grecian women engaged a principal share of their attention, and the Roman ladies seem to have been no less curious with respect to theirs. They generally wore it long, and dressed it in a variety of ways, ornamenting it with gold, silver, pearls, &c. On the contrary, the men amongst the Greeks and Romans, and amongst the later Jews, wore their hair short, as may be collected from books, medals, statues, &c. This formed a principal distinction in dress betwixt the sexes. This observation illustrates a passage in St Paul's epistle to the Corinthians (1 Cor. xi. 14, 15.)

St Paul forbids the Corinthian women, when praying by divine inspiration, to have their hair dishevelled; probably because this made them resemble the heathen priestesses, when actuated by the pretended influence of their gods.

Amongst the Greeks, both sexes, a few days before marriage, cut off and consecrated their hair as an offering to their favourite deities. It was also customary among them to hang the hair of the dead on the doors of their houses previous to interment. They likewise tore, cut off, and sometimes shaved their hair, when mourning for their deceased relations or friends, which they laid upon the corpse or threw into the pile, to be consumed together with the body. The ancients imagined that no person could die till a lock of hair was cut off; and this act they supposed was performed by the invisible hand of death, or Iris, or some other messenger of the gods. This hair, thus cut off, they fancied consecrated the person to the infernal deities, under whose jurisdiction the dead were supposed to be. It was a sort of first fruits which sanctified the whole. (See *Virg. Æn.* 4. 694.)

Whatever was the fashion, with respect to the hair, in the Grecian states, slaves were forbidden to imitate the freemen. The hair of the slaves was always cut in a particular manner, called *τριξ ἀνδραποδων*, which they no longer retained after they procured their freedom.

It was esteemed a notable honour among the ancient Gauls to have long hair, and hence came the appellation *Gallia comata*. For this reason Julius Cæsar, upon subduing the Gauls, made them cut off their hair as a token of submission.—It was with a view to this, that such as afterwards quitted the world to go and live in cloisters, procured their hair to be shaven off; to show that they bid adieu to all earthly ornaments, and made a vow of perpetual subjection to their superiors.

Greg. of Tours assures us, that in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood to wear long hair, artfully dressed and curled: every body else was obliged to be polled, or cut round, in sign of inferiority and obedience. Some writers assure us, that there were different cuts for all the different qualities and conditions; from the prince who wore it at full length, to the slave or villain who was quite cropt.—To cut off the hair of a son of France, under the first race of kings, was to declare him excluded from the right of succeeding to the crown, and reduced to the condition of a subject.

In the eighth century, it was the custom of people of quality to have their childrens hair cut the first time by

Hair.

by persons they had a particular honour and esteem for; who, in virtue of this ceremony, were reputed a sort of spiritual parents or godfathers thereof: Tho' this practice appears to have been more ancient; inasmuch as we read, that Constantine sent the pope the hair of his son Heraclius, as a token that he desired him to be his adoptive father.

The parade of long hair became still more and more obnoxious in the progress of Christianity, as something utterly inconsistent with the profession of persons who bore the cross. Hence numerous injunctions and canons to the contrary.—Pope Anicetus is commonly supposed to have been the first who forbade the clergy to wear long hair: but the prohibition is of an older standing in the churches of the east; and the letter wherein that decree is written, is of a much later date than that pope.—The clerical tonsure is related by Isidore Hispalensis, as of apostolical institution.

Long hair was anciently held so odious, that there is a canon still extant of the year 1096, importing, that such as wore long hair should be excluded coming into church while living, and not be prayed for when dead. We have a furious declamation of Luitprand against the emperor Phocas, for wearing long hair, after the manner of the other emperors of the east, all except Theophilus, who being bald, enjoined all his subjects to shave their heads.

The French historians and antiquaries have been very exact in recording the head of hair of their several kings. Charlemagne wore it very short, his son shorter; Charles the bald had none at all. Under Hugh Capet it began to appear again: this the ecclesiastics took in dudgeon, and excommunicated all who let their hair grow. Peter Lombard expostulated the matter so warmly with Charles the Young, that he cut off his hair; and his successors for some generations wore it very short.—A professor of Utrecht, in 1650, wrote expressly on the question, Whether it be lawful for men to wear long hair? and concluded for the negative.—Another divine, named Reves, who had written for the affirmative, replied to him.

The ancient Britons were extremely proud of the length and beauty of their hair, and were at much pains in dressing and adorning their heads. Some of them carried their fondness for and admiration of their hair to an extravagant height. It is said to have been the last and most earnest request of a young warrior, who was taken prisoner and condemned to be beheaded, that no slave might be permitted to touch his hair, which was remarkably long and beautiful, and that it might not be stained with his blood. We hardly ever meet with a description of a fine woman or beautiful man, in the poems of Ossian, but their hair is mentioned as one of their greatest beauties. Not contented with the natural colour of their hair, which was commonly fair or yellow, they made use of certain washes to render it still brighter. One of these washes was a composition of lime, the ashes of certain vegetables, and tallow. They made use of various arts also to make the hair of their heads grow thick and long; which last was not only esteemed a great beauty, but was considered as a mark of dignity and noble birth. Boadicia, queen of the Iceni, is described by Dio with very long hair, flowing over her shoulders, and reaching down below the middle of her back.

Hair.

The Britons shaved all their beards, except their upper lips; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length.

In after-times, the Anglo-Saxons and Danes also considered fine hair as one of the greatest beauties and ornaments of their persons, and were at no little pains in dressing it to advantage. Young ladies before marriage wore their hair uncovered and untied, flowing in ringlets over their shoulders; but as soon as they were married, they cut it shorter, tied it up, and put on a head-dress of some kind or other according to the prevailing fashion. To have the hair entirely cut off was so great a disgrace, that it was one of the greatest punishments inflicted on those women who were guilty of adultery. The Danish soldiers who were quartered upon the English, in the reigns of Edgar the Peaceable and of Ethelred the Unready, were the beaux of those times, and were particularly attentive to the dressing of their hair; which they combed at least once every day, and thereby captivated the affections of the English ladies. The clergy, both secular and regular, were obliged to shave the crowns of their heads, and keep their hair short, which distinguished them from the laity; and several canons were made against their concealing their tonsure, or allowing their hair to grow long. The shape of this clerical tonsure was the subject of long and violent debates between the English clergy on the one hand, and those of the Scots and Picts on the other; that of the former being circular, and that of the latter only semicircular. It appears very plainly, that long flowing hair was universally esteemed a great ornament; and the tonsure of the clergy was considered as an act of mortification and self-denial, to which many of them submitted with reluctance, and endeavoured to conceal as much as possible. Some of them who affected the reputation of superior sanctity inveighed with great bitterness against the long hair of the laity; and laboured earnestly to persuade them to cut it short, in imitation of the clergy. Thus the famous St Wulstan bishop of Worcester, is said to have declaimed with great vehemence against luxury of all kinds, but chiefly against long hair as most criminal and most universal. "The English (says William of Malmesbury in his life of St Wulstan) were very vicious in their manners, and plunged in luxury, through the long peace which they had enjoyed in the reign of Edward the Confessor. The holy prelate Wulstan reproved the wicked of all ranks with great boldness; but he rebuked those with the greatest severity who were proud of their long hair. When any of those vain people bowed their heads before him to receive his blessing, before he gave it, he cut a lock of their hair with a little sharp knife, which he carried about him for that purpose; and commanded them, by way of penance for their sins, to cut all the rest of their hair in the same manner. If any of them refused to comply with this command, he denounced the most dreadful judgments upon them, reproached them for their effeminacy, and foretold, that as they imitated women in the length of their hair, they would imitate them in their cowardice when their country was invaded; which was accomplished at the landing of the Normans."

This continued to be long a topic of declamation among the clergy, who even represented it as one of the

the

Hair.

Hair.

the greatest crimes, and most certain marks of reprobation. Anselm archbishop of Canterbury went so far as to pronounce the then terrible sentence of excommunication against all who wore long hair, for which pious zeal he is very much commended. Serlo, a Norman bishop, acquired great honour by a sermon which he preached before Henry I. A. D. 1104, against long and curled hair, with which the king and all his courtiers were so much affected, that they consented to resign their flowing ringlets, of which they had been so vain. The prudent prelate gave them no time to change their minds, but immediately pulled a pair of shears out of his sleeve, and performed the operation with his own hand. Another incident happened about 25 years after, which gave a temporary check to the prevailing fondness for long hair. It is thus related by a contemporary historian: "An event happened, A. D. 1129, which seemed very wonderful to our young gallants; who, forgetting that they were men, had transformed themselves into women by the length of their hair. A certain knight, who was very proud of his long luxuriant hair, dreamed that a person suffocated him with its curls. As soon as he awoke from his sleep, he cut his hair to a decent length. The report of this spread over all England, and almost all the knights reduced their hair to the proper standard. But this reformation was not of long continuance; for in less than a year all who wished to appear fashionable returned to their former wickedness, and contended with the ladies in length of hair. Those to whom nature had denied that ornament supplied the defect by art."

The Greeks, and, after their example, the Romans, wore false hair.

Commerce of Hair. Hair makes a very considerable article in commerce, especially since the mode of perukes has obtained. The hair of the growth of the northern countries, as England, &c. is valued much beyond that of the more southern ones, as Italy, Spain, the south parts of France, &c. The merit of good hair consists in its being well fed, and neither too coarse nor too slender; the bigness rendering it less susceptible of the artificial curl, and disposing it rather to frizzle, and the smallness making its curl of too short duration. Its length should be about 25 inches; the more it falls short of this the less value it bears.

There is no certain price for hair; but it is sold from five shillings to five pounds an ounce, according to its quality.

The scarceness of grey and white hair has put the dealers in that commodity upon the methods of reducing other colours to this. This is done by spreading the hair to bleach on the grass like linen, after first washing it out in a lixivious water. This lye, with the force of the sun and air, brings the hair to so perfect a whiteness, that the most experienced person may be deceived therein; there being scarce any way of detecting the artifice, but by boiling and drying it, which leaves the hair of the colour of a dead walnut-tree leaf.

There is also a method of dyeing hair with bismuth, which renders such white hair as borders too much upon the yellow of a bright silver colour: boiling is the proof of this too, the bismuth not being able to stand it.

Hair may be also changed from a red, grey, or other disagreeable colour, to a brown or deep black, by a solution of silver. The liquors sold under the name of *hair-waters*, are at bottom no more than solutions of silver in aquafortis, largely diluted with water, with the addition perhaps of other ingredients, which contribute nothing to their efficacy. The solution should be fully saturated with the silver, that there may be no more acid in it than is necessary for holding the metal dissolved; and besides dilution with water, a little spirit of wine may be added for the further dulcification of the acid. It must be observed, that for diluting the solution, distilled water, or pure rain-water, must be used; the common spring-waters turning it milky, and precipitating a part of the dissolved silver. It is to be observed also, that if the liquor touches the skin, it has the same effect on it as on the matter to be stained, changing the part moistened with it to an indelible black.—Hair may also be dyed of any colour in the same manner as wool. See DYEING.

Hair which does not curl or buckle naturally is brought to it by art, by first boiling and then baking it in the following manner: After having picked and sorted the hair, and disposed it in parcels according to lengths, they roll them up and tie them tight down upon little cylindrical instruments, either of wood or earthen ware, a quarter of an inch thick, and hollowed a little in the middle, called *pipes*; in which state they are put in a pot over the fire, there to boil for about two hours. When taken out, they let them dry; and when dried, they spread them on a sheet of brown paper, cover them with another, and thus send them to the pastry cook; who making a crust or coffin around them of common paste, sets them in an oven, till the crust is about three-fourths baked.

The end by which a hair grew to the head is called the *head of the hair*; and the other, with which they begin to give the buckle, the *point*. Formerly the peruke-makers made no difference between the ends, but curled and wove them by either indifferently: but this made them unable to give a fine buckle; hair woven by the point never taking a right curl. Foreigners own themselves obliged to the English for this discovery, which was first carried abroad by a peruke-maker of our country.

Hair is also used in various other arts and manufactures.—In particular, the hair of beavers, hares, conies, &c. is the principal matter whereof hats are made. Spread on the ground, and left to putrefy on cornlands, hair, as all other animal substances, *viz.* horns, hoofs, blood, garbage, &c. proves good manure.

HAIR, in farriery, is generally called the *coat*; and, with regard to horses, deserves particular consideration.

The hair growing on the fetlock serves as a defence to the prominent part of it in travelling in stoney ways or in frosty weather. If the hair of a horse's neck, and the parts most uncovered, be close, smooth, and sleek, it is an indication of his being in health and good case. In order to make the hair of an horse soft and sleek, he must be kept warm at heart, for the least inward cold will cause the hair to stare; also sweat him often, for that will loosen and raise the dust and filth that renders his coat foul; and when he is in the heat of a sweat, scrape off all the white foam, sweat, and filth, that is raised up with an old sword-blade; and also when he is blooded, if you rub him all over with

hairs

Hair,
Hake.

his own blood, repeating it two or three days, and curry and dress him well, it will make his coat shine as if covered with a fine varnish.

Hair falling from the mane or tail is caused either by his having taken some heat, which has engendered a dry mange; or from some surfeit, which causes the evil humours to resort to those parts. To cure this, anoint the horse's mane and crest with black soap; make a strong lee of ashes, and wash it all over with it. But if a canker should grow on a horse's tail, which will eat away both flesh and bone; then put some oil of vitriol to it, and it will consume it: and if you find that the vitriol corrodes too much, you need only to wet it with cold water, and it will put a stop to it.

If you would take away hair from any part of a horse's body, boil half a pound of lime in a quart of water, till a fourth part is consumed, to which add an ounce of orpiment; make this into a plaster, and lay it on.

HAIR, or *Down*, of Plants; a general term expressive of all the hairy and glandular appearances on the surface of plants, to which they are supposed by naturalists to serve the double purpose of defensive weapons and vessels of secretion.

These hairs are minute threads of greater or less length and solidity; some of them visible to the naked eye; whilst others are rendered visible only by the help of glasses. Examined by a microscope, almost all the parts of plants, particularly the young stalks or stems, appear covered with hairs.

Hairs on the surface of plants present themselves under various forms: in the leguminous plants, they are generally cylindric; in the mallow tribe, terminated in a point; in agrimony, shaped like a fish-hook; in nettle, awl-shaped and jointed; and in some compound flowers with hollow or funnel-shaped florets, they are terminated in two crooked points.

Probable as some experiments have rendered it, that the hairs on the surface of plants contribute to some organical secretion, their principal use seems to be to preserve the parts in which they are lodged from the bad effects of violent frictions, from winds, from extremes of heat and cold, and such like external injuries.

M. Guettard, who has established a botanical method from the form, situation, and other circumstances of the hairy and glandular appearances on the surface of plants, has demonstrated, that these appearances are generally constant and uniform in all the plants of the same genus. The same uniformity seems to characterise all the different genera of the same natural order.

The different sorts of hairs which form the down upon the surface of plants were imperfectly distinguished by Grew in 1682, and by Malpighi in 1686. M. Guettard just mentioned was the first who examined the subject both as a botanist and a philosopher. His observations were published in 1747.

HAIR-Cloths, in military affairs, are large pieces of cloth made with half hair. They are used for covering the powder in waggons, or upon batteries; as also for covering charged bombs or hand-grenades, and many other uses in magazines.

HAIR-Powder. See STARCH.

HAIR-Worm. See GORDIUS.

HAKE, in ichthyology, the English name of a
N^o 147.

fish common in the English and some other seas, and called by authors the *merlucius* and *lucius marinus*. This fish was used of old dried and salted. Hence the proverb obtains in Kent, *As dry as a hake*.

HAKLUYT (Richard), a naval historian, is supposed to have been born in London about the year 1553, and descended of a genteel family in Herefordshire, as the name frequently occurs in the list of high sheriffs for that county in former reigns. He was educated at Westminster-school; and thence, in 1570, removed to Christchurch, Oxford; where he applied himself particularly to the study of cosmography, and read public lectures in that science. Sir Edward Stafford being sent ambassador to France in 1583, Mr Hakluyt was one of his attendants, probably in the capacity of chaplain. He was at this time master of arts and professor of divinity. In 1585 he obtained the royal mandate for the next vacant prebend of Bristol, to which preferment he succeeded during his residence at Paris. Constantly attentive to his favourite cosmographical inquiries, in searching the French libraries, he found a valuable history of Florida, which had been discovered about 20 years before by Captain Loudonniere and others: this he caused to be published, at his own expence, in the French language, and soon after revised and republished Peter Martyr's book *De orbe novo*. After five years residence in France, Mr Hakluyt returned to England in company with lady Sheffield, sister to the lord admiral Howard. In the year 1589 he published his *Collection of Voyages* in one folio volume, which in 1598 was republished in three. In 1605 our author was made prebendary of Westminster; which, with the rectory of Wetheringset in the county of Suffolk, seems to have been the summit of his preferment. He died in 1616, and was buried in Westminster-abbey; bequeathing to his son Edmund his manor of Bridge-Place, and several houses in Tothill-street, Westminster. He was an indefatigable and faithful historian. His works are, 1. A *Collection of Voyages and Discoveries*, a small volume. 2. *History of Florida*, above mentioned. 3. *The principal Navigations, Voyages, and Discoveries of the English Nation, made by Sea or over Land to the farthest distant Quarters of the Earth, at any time within the compals of these 1500 years*, in three vols folio. 4. *The Discoveries of the World, from the first Original to the Year 1555*, written in the Portugal tongue by Ant. Galvano; corrected, much amended, and translated into English, by Richard Hakluyt. 5. *Virginia richly valued, by the Description of the Main Land of Florida, her next Neighbour, &c.* written by a Portugal gentleman of Elvas, and translated by Richard Hakluyt. Besides these, he left several manuscripts, which were printed in Purchas's collection.

HALBERSTADT, a small principality of Germany, bounded on the north-east by the duchy of Magdeburg, on the south by the principality of Anhalt, on the west by the diocese of Hildsheim, on the east by part of the electorate of Saxony, and on the north by Brunswic Wolfenbuttle. It is near 40 miles in length and 30 in breadth. The soil in general is fertile in corn and flax; and there are some woods, though in general fuel is scarce. There are three large towns in it which send representatives to the diet, together with 10 small ones, and 91 county-towns and villages.

Hakluyt,

stadt.

Halbert-
Halt
||
Halde.

villages. The number of the inhabitants is computed at about 200,000: the greatest part of them are Lutherans; but there are also Calvinists, Jews, and Roman Catholics. The manufactures are chiefly woollen (for the country produces a great number of sheep); the exports are grain, and a kind of beer called *broiban*. The annual revenue arising from this principality, and the incorporated counties and lordships, is said to amount to 500,000 rix-dollars. Till the treaty of Westphalia in 1648 this country was a diocese, but was then transferred to the electoral house of Brandenburg as a temporal principality. It is intitled to a vote both in the diet of the empire and that of the circle. The principal places are Halberstadt, Groningen, Ocherfleben, Osterwick, &c.

HALBERSTADT, a city of Germany, in the circle of Lower Saxony, seated near the river Hothain. It is a neat uniform place; and has some good churches and other handsome buildings, of which the cathedral is the chief. There is an inn in this place, which is looked upon to be the largest and to have the best accommodations of any in Europe. Before the Reformation, it was a bishop's see. E. Long. 11. 29. N. Lat. 52. 6.

HALBERT, or HALBARD, in the art of war, a well-known weapon carried by the sergeants of foot and dragoons. It is a sort of spear, the shaft of which is about five feet long, and made of ash or other wood. Its head is armed with a steel point, not unlike the point of a two-edged sword. But, besides this sharp point which is in a line with the shaft, there is a cross piece of steel, flat and pointed at both ends; but generally with a cutting edge at one extremity, and a bent sharp point at the other; so that it serves equally to cut down or to push withal. It is also useful in determining the ground between the ranks, and adjusting the files of a battalion. The word is formed of the German *hal*, "hall," and *bard*, "an hatchet." Vossius derives it from the German *hallebaert*, of *bel*, "clarus, splendens," and *baert*, "ax."

The halbert was anciently a common weapon in the army, where there were companies of halbardiers. It is said to have been used by the Amazons, and afterwards by the Rhætians and Vindelicians about the year 570.

It was called the *Danish ax*, because the Danes bore an halbert on the left shoulder. From the Danes it was derived to the Scots, from the Scots to the English Saxons, and from them to the French.

HALCYON, in ornithology, a name given by the ancients to the alcedo or king's fisher. See ALCEDO.

HALCYON Days, in antiquity, a name given to seven days before and as many after the winter solstice; by reason the halcyon, invited by the calmness of the weather, laid its eggs in nests built in the rocks, close by the brink of the sea, at this season.

HALDE (John Baptist du), a learned French Jesuit, born at Paris in 1674. He was extremely well versed in Asiatic geography; and we have of his compilation a work intitled *Grand description de la Chine & de la Tartarie*, from original memoirs of the Jesuitical missionaries, in 4 vols folio. He was also concerned in a collection of letters begun by father Gobien, called *Des lettres edifiantes*, in 18 vols; and published some Latin poems and orations. He died in 1743.

VOL. VIII. Part I.

HALE, in the sea language, signifies *pull*; as, to hale up, is to pull up; to hale in or out, is to pull in or out. To over-hale a rope, is to hale it too stiff, or to hale it the contrary way.

Keel-HALE. See DUCKING.

HALE (Sir Matthew), lord chief justice of the king's-bench in the reign of Charles II. was the son of Robert Hale, Esq; a barrister of Lincoln's Inn, and was born in 1609. He was educated at Oxford, where he made a considerable progress in learning; but was afterwards diverted from his studies by the levities of youth. From these he was reformed by Mr John Glanvill serjeant at law; and applying to the study of the law, entered into Lincoln's Inn. Noy the attorney-general took early notice of him, and directed him in his studies. Mr Selden also took much notice of him; and it was this acquaintance that first set Mr Hale on a more enlarged pursuit of learning, which he had before confined to his own profession. During the civil wars, he behaved so well as to gain the esteem of both parties. He was employed in his practice by all the king's party; and was appointed by the parliament one of the commissioners to treat with the king. The murder of king Charles gave him very sensible regret. However, he took the engagement; and was appointed, with several others, to consider of the reformation of the law. In 1653 he was by writ made serjeant at law, and soon after appointed one of the justices of the Common Pleas. Upon the death of Oliver Cromwell he refused to accept of the new commission offered him by Richard his successor. He was returned one of the knights of Gloucestershire in the parliament which called home Charles II. Soon after he was made lord chief baron of the exchequer; but declined the honour of knighthood, till lord chancellor Hyde, sending for him upon business when the king was at his house, told his majesty, that "there was his modest chief baron;" upon which he was unexpectedly knighted. He was one of the principal judges that sat in Clifford's Inn about settling the difference between landlord and tenant, after the fire of London, in which he behaved to the satisfaction of all parties concerned, and also in his post of chief baron acted with inflexible integrity. One of the first peers went once to his chamber, and told him, "That having a suit in law to be tried before him, he was then to acquaint him with it, that he might the better understand it when it should come to be tried in court." Upon which the lord chief baron interrupted him, and said, "He did not deal fairly to come to his chambers about such affairs; for he never received information of such causes but in open court, where both parties were to be heard alike." Upon which his grace (for it was a duke) went away not a little dissatisfied, and complained of it to the king as a rudeness that was not to be endured; but his majesty bid him content himself that he was used no worse; and said, "That he verily believed he would have used him no better if he had gone to solicit him in any of his own causes." Another remarkable incident happened in one of his circuits. A gentleman who had a trial at the assizes had sent him a buck for his table. When judge Hale therefore heard his name, he asked "if he was not the same person who had sent him the venison?" and finding that he was the same, told him, that "he could

Hale.

Hales.

not suffer the trial to go on till he had paid him for his buck." The gentleman answered, that "he never sold his venison; and that he had done nothing to him which he did not do to every judge who had gone that circuit:" which was confirmed by several gentlemen present. The lord chief baron, however, would not suffer the trial to proceed till he had paid for the present: upon which the gentleman withdrew the record. In short, he was in 1671 advanced to be lord chief justice of the king's bench; but about four years after this promotion, his health declining, he resigned his post in February 1675-6, and died in December following. This excellent man, who was an ornament to the bench, to his country, and to human nature, wrote, 1. An Essay on the Gravitation and Non-gravitation of Fluid Bodies. 2. Observations touching the Torricellian Experiment. 3. Contemplations, moral and divine. 4. The Life of Pomponius Atticus, with political and moral Reflections. 5. Observations on the Principles of natural Motion. 6. The primitive Origination of Mankind. He also left a great number of manuscripts, in Latin and English, upon various subjects; among which are, his Pleas of the Crown, since published by Mr Emyln in two volumes folio; and his Original Institution, Power, and Jurisdiction of Parliaments.

HALES (Stephen), D. D. a celebrated divine and philosopher, was born in 1677. He was the sixth son of Thomas Hales, Esq; the eldest son of Sir Robert Hales, created a baronet by king Charles II. and Mary the heiress of Richard Langley of Abbots-Wood in Hertfordshire. In 1696 he was entered a pensioner at Bennet-college, Cambridge; and was admitted a fellow in 1703, and became bachelor of divinity in 1711. He soon discovered a genius for natural philosophy. Botany was his first study; and he used frequently to make excursions among Gogmagog hills, in company with Dr Stukely, with a view of prosecuting that study. In these expeditions he likewise collected fossils and insects, having contrived a curious instrument for catching such of the latter as have wings. In company with this friend he also applied himself to the study of anatomy, and invented a curious method of obtaining a representation of the lungs in lead. They next applied themselves to the study of chemistry; in which, however, they did not make any remarkable discoveries. In the study of astronomy Mr Hales was equally assiduous. Having made himself acquainted with the Newtonian system, he contrived a machine for showing the phenomena on much the same principles with that afterwards made by Mr Rowley, and, from the name of his patron, called an *Orrery*.

About the year 1710 he was presented to the perpetual cure of Teddington near Twickenham, in Middlesex; and afterwards accepted of the living of Porlock in Somersetshire, which vacated his fellowship in the college, and which he exchanged for the living of Faringdon in Hampshire. Soon after, he married Mary, the daughter and heiress of Dr Newce, who was rector of Halisham in Suffex, but resided at Much-Haddam in Hertfordshire. On the 13th of March 1718, he was elected member of the Royal Society; and on the 5th of March, in the year following, he exhibited an account of some experiments he had lately made on the effect of the

sun's warmth in raising the sap in trees. This procured him the thanks of the society, who also requested him to prosecute the subject. With this request he complied with great pleasure; and on the 14th of June 1725 exhibited a treatise in which he gave an account of his progress. This treatise being highly applauded by the society, he farther enlarged and improved it; and in April 1727 he published it under the title of *Vegetable Statics*. This work he dedicated to his late majesty king George II. who was then prince of Wales; and he was the same year chosen one of the council of the Royal Society, Sir Hans Sloan being at the same annual election chosen their president. The book being well received, a second edition of it was published in 1731. In a preface to this edition Mr Hales promised a sequel to the work, which he published in 1733 under the title of *Statical Essays*, &c. In 1732 he was appointed one of the trustees for establishing a new colony in Georgia. On the 5th of July 1733 the university of Oxford honoured him with a diploma for the degree of doctor in divinity; a mark of distinction the more honourable, as it is not usual for one university to confer academical honours on those who were educated at another. In 1734, when the health and morals of the lower and middling class of people were subverted by the excessive drinking of gin, he published, though without his name, A friendly Admonition to the Drinkers of Brandy and other spirituous Liquors; which was twice reprinted. The latter end of the same year he published a sermon which he preached at St Bride's before the rest of the trustees for establishing a new colony in Georgia. His text was, "Bear ye one another's burthens, and so fulfil the law of Christ;" Galatians vi. 2. In 1739 he printed a volume in 8vo, intitled, Philosophical Experiments on Sea-water, Corn, Flesh, and other Substances. This work, which contained many useful instructions for voyagers, was dedicated to the lords of the admiralty. The same year he exhibited to the Royal Society an account of some farther experiments towards the discovery of medicines for dissolving the stone in the kidneys and bladder, and preserving meat in long voyages; for which he received the gold medal of Sir Godfrey Copley's donation. The year following he published some account of Experiments and Observations on Mrs Stephens's Medicines for dissolving the Stone, in which their dissolvent power is inquired into and demonstrated.

In 1741 he read before the Royal Society an account of an instrument which he invented, and called a *ventilator*, for conveying fresh air into mines, hospitals, prisons, and the close parts of ships: he had communicated it to his particular friends some months before; and it is very remarkable, that a machine of the same kind, for the same purpose, was in the spring of the same year invented by one Martin Triewald, an officer in the service of the king of Sweden, called *captain of mechanics*, for which the king and senate granted him a privilege in October following, and ordered every ship of war in the service of that state to be furnished with one of them; a model also of this machine was sent into France, and all the ships in the French navy were also ordered to have a ventilator of the same sort. It happened also, that about the same time one Sutton, who kept a coffeehouse in Aldersgate-street,

Hales.

Hales.

Hales.

street, invented a ventilator of another construction to draw off the foul air out of ships by means of the cook-room fire: but poor Sutton had not interest enough to make mankind accept the benefit he offered them; tho' its superiority to Dr Hales's contrivance was evident, and among others Dr Mead and the late ingenious Mr Benjamin Robins gave their testimony in its favour: (See *Air-Pipes*.) The public, however, is not less indebted to the ingenuity and benevolence of Dr Hales, whose ventilators came more easily into use for many purposes of the greatest importance to life, particularly for keeping corn sweet, by blowing through it fresh showers of air; a practice very soon adopted by France, a large granary having been made, under the direction of Duhamel, for the preservation of corn in this manner, with a view to make it a general practice.

In 1743, Dr Hales read before the Royal Society a description of a method of conveying liquors into the *abdomen* during the operation of tapping, and it was afterwards printed in their Transactions. In 1745, he published some experiments and observations on tar-water, which he had been induced to make by the publication of a work called *Siris*, in which the late learned and most excellent Dr Berkley, bishop of Cloyne, had recommended tar-water as an universal medicine: on this occasion several letters passed between them on the subject, particularly with respect to the use of tar-water in the disease of the horned cattle. In the same year he communicated to the public, by a letter to the editor of the Gentleman's Magazine, a description of a *back-heaver*, which will winnow and clean corn much sooner and better than can be done by the common method. He also, at the same time, and by the same channel, communicated to the public a cheap and easy way to preserve corn sweet in sacks; an invention of great benefit to farmers, especially to poor leasers, who want to keep small quantities of corn for some time, but have no proper granary or repository for that purpose. He also the same year took the same method to publish directions how to keep corn sweet in heaps without turning it, and to sweeten it when musty. He published a long paper, containing an account of several methods to preserve corn by ventilators; with a particular description of several sorts of ventilators, illustrated by a cut, so that the whole mechanism of them may be easily known, and the machine constructed by a common carpenter. He published also in the same volume, but without his name, a detection of the fallacious boasts concerning the efficacy of the liquid shell in dissolving the stone in the bladder. In 1746 he communicated to the Royal Society a proposal for bringing small passable stones soon, and with ease, out of the bladder; and this was also printed in their Transactions. In the Gentleman's Magazine for July 1747, he published an account of a very considerable improvement of his back-heaver, by which it became capable of clearing corn of the very small grain, seeds, blacks, smut-balls, &c. to such perfection as to make it fit for seed-corn. In 1748 he communicated to the Royal Society a proposal for checking, in some degree, the progress of fires, occasioned by the great fire which happened that year in Cornhill: And the substance of this proposal was printed in their Transactions. In the same year he

also communicated to the Society two memoirs, which are printed in their Transactions; one on the great benefit of ventilators, and the other on some experiments in electricity. In 1749 his ventilators were fixed in the Savoy prison, by order of the right hon. Henry Fox, Esq; then secretary at war, afterwards lord Holland; and the benefit was so great, that though 50 or 100 in a year often died of the gaol-distemper before, yet from the year 1749 to the year 1752 inclusive, no more than four persons died, though in the year 1750 the number of prisoners was 240; and of those four, one died of the small-pox, and another of intemperance. In the year 1750 he published some considerations on the causes of earthquakes; occasioned by the slight shocks felt that year in London. The substance of this work was also printed in the Philosophical Transactions. The same year he exhibited an examination of the strength of several purging waters, especially of the water of *Jessop's well*, which is printed in the Philosophical Transactions.

Dr Hales had now been several years honoured with the esteem and friendship of his royal highness Frederick prince of Wales; who frequently visited him at Teddington, from his neighbouring palace at Kew, and took a pleasure in surprising him in the midst of those curious researches into the various parts of nature which almost incessantly employed him. Upon the prince's death, which happened this year, and the settlement of the household of the princess-dowager, he was, without his solicitation, or even knowledge, appointed clerk of the closet or almoner to her royal highness. In 1751 he was chosen by the college of physicians to preach the annual sermon called *Crowne's lecture*: Dr William Crowne having left a legacy for a sermon to be annually preached on "the wisdom and goodness of God displayed in the formation of man." Dr Hales's text was, *With the ancient is wisdom, and in length of days understanding*, Job xii. 12. This sermon, as usual, was published at the request of the college. In the latter end of the year 1752, his ventilators, worked by a windmill, were fixed in Newgate, with branching trunks to 24 wards; and it appeared that the disproportion of those that died in the gaol before and after this establishment was as 16 to 7. He published also a farther account of their success, and some observations on the great danger arising from foul air, exemplified by a narrative of several persons seized with the gaol-fever by working in Newgate.

On the death of Sir Hans Sloane, which happened in the year 1753, Dr Hales was elected a member of the Academy of Sciences at Paris in his room. The same year he published in the Gentleman's Magazine some farther considerations about means to draw the foul air out of the sick rooms of occasional army-hospitals, and private houses in town. He also published many other curious particulars relative to the use and success of ventilators. The same year a description of a sea-gage, which the doctor invented to measure unfathomable depths, was communicated to the public in the same miscellany: this paper was drawn up about the year 1732 or 1733, by the doctor, for the late Colin Campbell, Esq; who employed the ingenious Mr Hawksbee to make the machine it describes, which was tried in various depths, and answered with great

Hales.
Half-blood

exactness, yet was at last lost near Bermuda. In 1754, he communicated to the Royal Society some experiments for keeping water and fish sweet with lime-water, an account of which was published in the Philosophical Transactions. He also continued to enrich their memoirs with many useful articles from this time till his death, particularly a method of forwarding the distillation of fresh from salt water by blowing showers of fresh air up through the latter during the operation. In 1757 he communicated to the editor of the Gentleman's Magazine an easy method of purifying the air, and regulating its heat in melon-frames and green-houses; also further improvements in his method of distilling sea-water.

His reputation and the interest of his family and friends might easily have procured him farther preferment: but of farther preferment he was not desirous; for being nominated by his late Majesty to a canonry of Windsor, he engaged the princess to request his majesty to recal his nomination. That a man so devoted to philosophical studies and employments, and so conscientious in the discharge of his duty, should not desire any preferment which would reduce him to the dilemma either of neglecting his duty, or foregoing his amusement, is not strange: but that he would refuse an honourable and profitable appointment, for which no duty was to be done that would interrupt his habits of life, can scarce be imputed to his temperance and humility without impeaching his benevolence; for if he had no wish of any thing more for himself, a liberal mind would surely have been highly gratified by the distribution of so considerable a sum as a canonry of Windsor would have put into his power, in the reward of industry, the alleviation of distress, and the support of helpless indigence. He was, however, remarkable for social virtue and sweetness of temper; his life was not only blameless, but exemplary in a high degree; he was happy in himself, and beneficial to others, as appears by this account of his attainments and pursuits; the constant serenity and cheerfulness of his mind, and the temperance and regularity of his life, concurred, with a good constitution, to preserve him in health and vigour to the uncommon age of fourscore and four years. He died at Teddington in 1761; and was buried, pursuant to his own directions, under the tower of the parish-church, which he built at his own expence not long before his death.—Her royal highness the princess of Wales erected a monument to his memory in Westminster abbey.

HALESIA, in botany: A genus of the monogynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the 18th order, *Bicornes*. The calyx is quadridentated, superior; the corolla quadrifid; the nut quadrangular and dispermous.

HALESWORTH, a town of Suffolk in England, seated on a neck of land between two branches of the river Blith, 101 miles from London. It is a well frequented thriving place, and has a trade in linen-yarn and sail-cloth. It has one large church, and about 700 good houses; but the streets are neither wide nor paved. About the town is raised a great deal of hemp. E. Long. 1. 40. N. Lat. 52. 30.

HALF-BLOOD, in law, is where a man marries a

second wife, the first being dead, and by the first venturer he has a son, and by his second venter has likewise a son; the two brothers, in this case, are but of half-blood. See CONSANGUINITY and DESCENT.

HALF-Merk; a noble, or 6s. 8d.

HALF-Moon, in fortification; an outwork composed of two faces, forming a salient angle, whose gorge is in form of a crescent or half-moon, whence the name.

HALFPENNY, a copper coin, whose value is expressed by its name, in reference to the penny.

HALI-BEIGH, first dragoman or interpreter at the Grand Signior's court in the 17th century, was born of Christian parents in Poland; but having been taken by the Tartars when he was young, they sold him to the Turks, who brought him up in their religion in the seraglio. His name, in his native country, was Bobowski. He learnt many languages, and Sir Paul Ricaut owns he was indebted to him for several things which he relates in his *Present state of the Ottoman empire*. He held a great correspondence with the English, who persuaded him to translate some books into the Turkish language; and he had a mind to return into the bosom of the Christian church, but died before he could accomplish the design. Dr Hyde published his book *Of the liturgy of the Turks, their pilgrimages to Mecca, their circumcision and visiting of the sick*. He translated the catechism of the church of England, and the bible, into the Turkish language. The MS. is lodged in the library of Leyden. He wrote likewise a Turkish grammar and dictionary.

HALICARNASSUS, (anc. geog.) a principal town of Caria, said to be built by the Argives, and situated between two bays, the Ceramicus and Jasius. It was the royal residence, (called *Zephyra* formerly); especially of Mausolus, made more illustrious by his monument. This monument was one of the seven wonders, and erected by Artemisia. Halicarnassus, or Halicarnassensis, was the gentilitious name of Herodotus and Dionysius. The former was called the Father of History; and the latter was not only a good historian but also a critic.

HALIÆTUS, in ornithology. See FALCO.

HALIEUTICS, HALIEUTICA, ΑΛΙΕΤΙΚΑ, formed of αλιευς, *fisherman*, which is derived from αλις, *sea*; books treating of fishes, or the art of fishing.—We have still extant the halieutics of Oppian.

HALIFAX, the capital of the province of Nova Scotia in America, situated in W. Long. 64. 30. N. Lat. 44. 45. It was founded in 1749, in order to secure the British settlements there from the attempts of the French and Indians. It was divided into 35 squares, each containing 16 lots of 40 by 60 feet; one established church, and one meeting-house, and a small number of houses out of the regular streets. The town was surrounded by pickettings, and guarded by forts on the outside; but since the commencement of the American troubles, it has been very strongly fortified. Along the river Chebucto, to the southward of the town, are buildings and fish-flakes for at least two miles, and to the northward on the river for about one mile. The plan, however, has been greatly improved by the earl of Halifax, who was the original contriver. The proclamation issued for this settlement, offered 50 acres of land to every soldier and sailor who would settle in that part

Half-merk
||
Halifax.

Halifax.

part of America, without paying any rent, or doing any service for ten years, and no more than one shilling *per annum* for each 50 acres ever afterwards: to every soldier and sailor who had a wife and children, ten acres more were added for every individual of his family, and for every increase that should afterwards happen in the same proportion; To each subaltern officer 80 acres, and 15 for each of his family; 200 acres to each ensign; 300 to each lieutenant; 400 to each captain; 600 to every officer in rank above a captain, and 30 for each of his family. The government also engaged to transport and maintain the new settlers for one year at its own expence, and to furnish them with such arms, provisions, utensils, implements, &c. as should be necessary to put them in a way to cultivate their lands, to build habitations, and to commence a fishery. The same conditions were likewise offered to all carpenters and other handicraftsmen; and surgeons were offered the same conditions with the ensigns.—This proclamation was published in March, and by the month of May 3700 persons had offered themselves. They accordingly embarked, and established themselves in the bay of Chebucto; calling their city *Halifax*, from the title of their patron. Before the end of October the same year, 350 comfortable wooden houses were built, and as many more during the winter.—The same year in which the settlers embarked, the government granted them 40,000*l.* for their expences. In 1750, they granted 57,582*l.* 17*s.* 3½*d.* for the same purpose; in 1751, 53,927*l.* 14*s.* 4*d.*; in 1752, 61,492*l.* 19*s.* 4½*d.*; in 1753, 94,615*l.* 12*s.* 4*d.*; in 1754, 58,447*l.* 2*s.*; and in 1755, 49,418*l.* 7*s.* 8*d.*—The place has at length attained a degree of splendor that bids fair to rival the first cities in the revolted colonies; for which it has been equally indebted to the late war, to the great increase of population from the exiled loyalists, and the fostering care of Great Britain; inasmuch, that the number of inhabitants has been more than doubled during the last ten years.

The harbour is perfectly sheltered from all winds at the distance of 12 miles from the sea, and is so spacious, that a thousand sail of ships may ride in it without the least danger. Upon it there are built a great number of commodious wharfs, which have from 12 to 18 feet water at all times of the tide, for the convenience of loading and unloading ships. The streets of the town are regularly laid out, and cross each other at right angles; the whole rising gradually from the water upon the side of a hill, whose top is regularly fortified, but not so as to be able to withstand a regular attack. Many considerable merchants reside at this place, and are possessed of shipping to the amount of several thousand tons, employed in a flourishing trade both with Europe and the West Indies. There is a small but excellent careening yard for ships of the royal navy that are upon this station, or that may have occasion to come in to refit, and take water, fuel, or fresh provisions on board, in their passage to and from the West Indies. It is always kept well provided with naval stores; and ships of the line are hove down and repaired with the greatest ease and safety. Several batteries of heavy cannon command the harbour, particularly those that are placed upon George's Island, which being very steep and high, and situated in mid-

channel, a little way below the town, is well calculated to annoy vessels in any direction, as they must of necessity pass very near it before they are capable of doing any mischief. Above the careening yard, which is at the upper end of the town, there is a large basin, or piece of water, communicating with the harbour below, near 20 miles in circumference, and capable of containing the whole navy of England, entirely sheltered from all winds, and having only one narrow entrance, which, as we observed before, leads into the harbour. There are a number of detached settlements lately formed by the loyalists upon the basin; the lands at a small distance from the water being generally thought better than those near to Halifax; but what success may attend their labours, will require some time to determine. An elegant and convenient building has been erected near the town for the convalescence of the navy; but the healthiness of the climate has as yet prevented many persons from becoming patients, scarcely any ships in the world being so free from complaints of every kind, in regard to health, as those that are employed upon this station. There is a very fine light-house, standing upon a small island, just off the entrance of the harbour, which is visible, either by night or day, six or seven leagues off at sea.

HALIFAX, earl of. See SAVILLE.

HALIFAX, a town in the west riding of Yorkshire in England, seated on the river Calder, in W. Long. 2. 0. N. Lat. 53. 45. It has the title of an earldom, and is very eminent for the clothier trade. The parish is said to be the most populous, if not the most extensive, in England: for it is above 30 miles in circumference; and, besides the mother church at Halifax, and 16 meeting-houses, has 12 chapels, two of which are parochial. What is a little singular, all the meeting-houses here, except the quakers, have bells and burying grounds. The woollens principally manufactured here are kerseys and shalloons. Of the former it is affirmed, that one dealer hath sent by commission 60,000 pounds worth in a year to Holland and Hamburgh; and of the latter, it is said, 100,000 pieces are made in this parish yearly. The inhabitants here and in the neighbouring towns are so entirely employed in these manufactures, that agriculture is but little minded. Most of their provisions of all sorts are brought from the north and east ridings, and from Lancashire, Cheshire, Nottinghamshire, and Warwickshire. The markets are very much crowded for the buying and selling provisions and manufactures. The cloths, at the first erecting of the woollen manufactures in these parts, having been frequently stolen off the tenters in the night, a law was made, by which the magistrates of Halifax were empowered to pass sentence on, and execute all offenders, if they were taken in the fact, or owned it, or if the stolen cloth was found upon them, provided also the crime was committed, and the criminal apprehended, within the liberties of the forest of Hardwick. Those found guilty were executed in the following manner: an axe was drawn by a pulley to the top of a wooden engine, and fastened by a pin, which being pulled out, the axe fell down in an instant, and did its work. If they had stole an ox, horse, or any other beast, it was led with them to the scaffold, and there fastened by a chord to the pin, that held up the axe; and when the signal was given

Halifax.

Haliotis
H
Hall.

given by the jurors, who were the first burghers with- in the several towns of the forest, the beast was driven away, and the pin plucked out, upon which the axe fell and did its office. This severe and summary course of justice gave occasion to a litany, which is still much more frequent in the mouths of the beggars and vagrants of these parts, than is the common prayer, viz.

"From Hell, Hull, and Halifax, good Lord deliver us:"

though neither the engine, nor manner of proceeding against them, are now in use.

HALIOTIS, the EAR-SHELL, a genus of insects belonging to the order of vermes testacea. This is an animal of the snail-kind, with an open shell resembling an ear. There are seven species, distinguished by the figure of their shells. See Plate CCXXXIV.

HALITZ, a town of Poland, and capital of a territory of the same name, in Red Russia, with a castle. It is seated on the river Neister. E. Long. 26. 0. N. Lat. 49. 20.

HALL, in architecture, a large room at the entrance of a fine house and palace. Vitruvius mentions three kinds of halls; the tetrastyle, with four columns supporting the platfond or ceiling; the Corinthian, with columns all round let into the wall, and vaulted over; and the Egyptian, which had a peristyle of insulated Corinthian columns, bearing a second order with a ceiling.

The hall is properly the finest as well as first member of an apartment: and in the houses of ministers of state, magistrates, &c. is the place where they dispatch business, and give audience. In very magnificent buildings, where the hall is larger and loftier than ordinary, and placed in the middle of the house, it is called a *saloon*.

The length of a hall should be at least twice and a quarter its breadth; and in great buildings, three times its breadth. As to the height of halls, it may be two-thirds of the breadth; and, if made with an arched ceiling, it will be much handsomer, and less liable to accidents by fire. In this case, its height is found by dividing its breadth into six parts, five of which will be the height from the floor to the under side of the key of the arch.

HALL is also particularly used for a court of justice; or an edifice wherein there is one or more tribunals.

In Westminster-hall are held the great courts of England, viz. the king's bench, chancery, common pleas, and exchequer. In adjoining apartments is likewise held the high court of parliament.

Westminster-hall was the royal palace or place of residence of our ancient kings; who ordinarily held their parliaments, and courts of judicature, in their dwelling-houses (as is still done by the kings of Spain), and frequently sat in person in the courts of judicature, as they still do in parliament. A great part of this palace was burnt under Henry VIII. what remains is still reserved for the said judicatories. The great hall, wherein the courts of king's bench, &c. are kept, is said to have been built by William Rufus; others say by Richard I. or II. It is reckoned superior, in point of dimensions, to any hall in Europe; being 300 feet long and 100 broad.

HALL (Joseph), an eminent prelate of the church of

England, was born in 1574, and educated at Cambridge. He became professor of rhetoric in that university, and then successively was made rector of Hales in Suffolk, presented to the living of Waltham in Essex, made prebendary of Wolverhampton, dean of Worcester, bishop of Exeter, and lastly of Norwich. His works testify his zeal against Popery, and are much esteemed. He lamented the divisions of the Protestants, and wrote something concerning the means of putting an end to them. July 1616, he attended the embassy of lord Doncaster into France, and upon his return was appointed by his majesty to be one of the divines who should attend him into Scotland. In 1618 he was sent to the synod of Dort with other divines, and pitched upon to preach a Latin sermon before that assembly. But being obliged to return from thence before the synod broke up, on account of his health, he was by the states presented with a gold medal. He wrote, 1. Miscellaneous epistles. 2. *Mian-dus alter et idem*. 3. A just censure of travellers. 4. The Christian Seneca. 5. Satires, in six books. 6. A century of meditations; and many other works, which, besides the above satires, make in all five volumes in folio and quarto. He died in 1656.

HALL (John), a poet of distinguished learning, was born at Durham, and educated at Cambridge, where he was esteemed the brightest genius in that university. In 1646, when he was but 19 years of age, he published his *Hora Vacua*, or Essays; and the same year came out his poems. He translated from the Greek "Hierocles upon the golden verses of Pythagoras;" before which is an account of the ingenious translator and his works, by John Davies of Kidwelly. He died in 1656, aged 29.

HALLAGE, a fee or toll paid for cloth brought to be sold in Blackwell-hall, London.

HALLAMAS, in our old writers, the day of all-hallows, or all-saints, viz. November 1. It is one of the cross quarters of the year which was computed, in ancient writings, from Hallamas to Candlemas.

HALLAND, a country of Sweden, in the island of Schonen, lying along the sea-coast, at the entrance of the Baltic Sea, and opposite to Jutland. It is 60 miles along the coast, but is not above 12 in breadth. Halmstadt is the capital town.

HALLATON, a town of Leicestershire, in England. It is seated on a rich soil, 12 miles south-east of Leicester, in E. Long. 0. 50. N. Lat. 52. 35.

HALLE, a little dismantled town of the Austrian Netherlands, in Hainault. The church of Notre Dame contains an image of the Virgin Mary, held in great veneration. E. Long. 3. 15. N. Lat. 50. 44.

HALLE, a handsome and considerable town of Germany, in the circle of Upper Saxony, and in the duchy of Magdeburg, with a famous university and salt-works. It belongs to the king of Prussia; and is seated in a pleasant plain on the river Sale, in E. Long. 12. 33. N. Lat. 51. 36.

HALLE, a free and imperial town of Germany, in Suabia, famous for its salt-pits. It is seated on the river Kocher, among rocks and mountains, in E. Lon. 10. 50. N. Lat. 49. 6.

HALLEIN, a town of Germany, in the circle of Bavaria, and archbishopric of Salzburg; seated on the

Hall
Hallein.

Hallelujah,
Haller.

the river Saltza, among the mountains, wherein are mines of salt, which are the chief riches of the town and country. E. Long. 12. 15. N. Lat. 47. 33.

HALLELUJA, a term of rejoicing, sometimes sung or rehearsed at the end of verses on such occasions.

The word is Hebrew; or rather, it is two Hebrew words joined together: one of them הללו, *hallelu*, and the other יהוה, *jah*; an abridgement of the name of God, יהוה, *gehorah*. The first signifies *laudate*, "praise ye;" and the other, *Dominum*, "the Lord."

St Jerome first introduced the word hallelujah into the church service: for a considerable time it was only used once a year in the Latin church, viz. at Easter; but in the Greek church it was much more frequent. St Jerome mentions its being sung at the interments of the dead, which still continues to be done in that church, as also on some occasions in the time of Lent.

In the time of Gregory the Great, it was appointed to be sung all the year round in the Latin church, which raised some complaints against that pope; as giving too much into the Greek way, and introducing the ceremonies of the church of Constantinople into that of Rome. But he excused himself by alleging, that this had been the ancient usage of Rome; and that it had been brought from Constantinople at the time when the word hallelujah was first introduced under pope Damascus.

HALLER (Albert Van), an eminent physician, was born at Bern, on the 16th of October 1708. He was the son of an advocate of considerable eminence in his profession. His father had a numerous family, and Albert was the youngest of five sons. From the first period of his education, he showed a very great genius for literature of every kind: to forward the progress of his studies, his father took into his family a private tutor, named *Abraham Billod*; and such was the discipline exerted by this pedagogue, that the accidental fight of him, at any future period of life, excited in Haller very great uneasiness, and renewed all his former terrors. According to the accounts which are given us, the progress of Haller's studies, at the earliest periods of life, was rapid almost beyond belief. When other children were beginning only to read, he was studying Bayle and Moreri; and at nine years of age he was able to translate Greek, and was beginning the study of Hebrew. Not long after this, however, the course of his education was somewhat interrupted by the death of his father; an event which happened when he was in the 13th year of his age. After this he was sent to the public school at Bern, where he exhibited many specimens of early and uncommon genius. He was distinguished for his knowledge in the Greek and Latin languages; but he was chiefly remarkable for his poetical genius: and his essays of this kind, which were published in the German language, were read and admired throughout the whole empire. In the 16th year of his age he began the study of medicine at Tübingen, under those eminent teachers Duvernoy and Camerarius; and continued there for the space of two years, when the great reputation of the justly celebrated Boerhaave drew him to Leyden. Nor was this distinguished teacher the only man from whose superior abilities he had there an opportunity of profit-

ing. Ruysch was still alive, and Albinus was rising into fame. Animated by such examples, he spent all the day, and the greatest part of the night, in the most intense study; and the proficiency which he made, gained him universal esteem both from his teachers and fellow-students. From Holland, in the year 1727, he came to England. Here, however, his stay was but short; and it was rather his intention to visit the illustrious men of that period, than to prosecute his studies at London. He formed connections with some of the most eminent of them. He was honoured with the friendship of Douglas and Cheselden; and he met with a reception proportioned to his merit from Sir Hans Sloane, president of the Royal Society. After his visit to Britain, he went to France; and there, under those eminent masters, Winslow and Le Dran, with the latter of whom he resided during his stay in Paris, he had opportunities of prosecuting anatomy, which he had not before enjoyed. But the zeal of our young anatomist was greater than the prejudices of the people at that period, even in the enlightened city of Paris, could admit of. An information being lodged against him to the police for dissecting dead bodies, he was obliged to cut short his anatomical investigations by a precipitate retreat. Still, however, intent on the farther prosecution of his studies, he went to Basil, where he became a pupil to the celebrated Bernoulli.

Thus improved and instructed by the lectures of the most distinguished teachers of that period, by uncommon natural abilities, and by unremitting industry, he returned to the place of his nativity in the 26th year of his age. Not long after this, he offered himself a candidate, first for the office of physician to an hospital, and afterwards for a professorship. But neither the character which he had before he left his native country, nor the same which he had acquired and supported while abroad, were sufficient to combat the interest opposed to him. He was disappointed in both; and it was even with difficulty that he obtained, in the following year, the appointment of keeper of a public library at Bern. The exercise of this office was indeed by no means suited to his great abilities: but it was agreeable to him, as it afforded him an opportunity for that extensive reading by which he has been so justly distinguished. The neglect of his merit which marked his first outset, neither diminished his ardour for medical pursuits, nor detracted from his reputation either at home or abroad. And soon after he was nominated a professor in the university of Göttingen, by king George II. The duties of this important office he discharged, with no less honour to himself than advantage to the public, for the space of 17 years; and it afforded him an ample field for the exertion of those great talents which he possessed. Extensively acquainted with the sentiments of others respecting the economy of the human body, struck with the diversity of opinions which they held, and sensible that the only means of investigating truth was by careful and candid experiment, he undertook the arduous task of exploring the phenomena of human nature from the original source. In these pursuits he was no less industrious than successful, and there was hardly any function of the body on which his experiments did not reflect either a new or a stronger light. Nor was it long necessary for him, in
this

Haller.

Haller. this arduous undertaking, to labour alone. The example of the preceptor inspired his pupils with the spirit of industrious exertion. Zinn, Zimmerman, Cالداني, and many others, animated by a generous emulation, laboured with indefatigable industry to prosecute and to perfect the discoveries of their great master. And the mutual exertion of the teacher and his students, not only tended to forward the progress of medical science, but placed the philosophy of the human body on a more sure, and an almost entirely new, basis. But the labours of Dr Haller, during his residence at Gottingen, were by no means confined to any one department of science. He was not more anxious to be an improver himself, than to instigate others to similar pursuits. To him, the Anatomical Theatre, the School of Midwifery, the Chirurgical Society, and the Royal Academy of Sciences at Gottingen, owe their origin. Such distinguished merit could not fail to meet with a suitable reward from the sovereign under whose protection he then taught. The king of Great Britain not only honoured him with every mark of attention which he himself could bestow, but procured him also letters of nobility from the emperor. On the death of Dillenius, he had an offer of the professorship of botany at Oxford; the states of Holland invited him to the chair of the younger Albinus; the king of Prussia was anxious that he should be the successor of Maupertius at Berlin. Marshal Keith wrote to him in the name of his sovereign, offering him the chancellorship of the university of Halle, vacant by the death of the celebrated Wolff. Count Orlov invited him to Russia, in the name of his mistress the empress, offering him a distinguished place at St Petersburg. The king of Sweden conferred on him an unsolicited honour, by raising him to the rank of knighthood of the order of the polar star; and the emperor of Germany did him the honour of a personal visit; during which he thought it no degradation of his character to pass some time with him in the most familiar conversation.

Thus honoured by sovereigns, revered by men of literature, and esteemed by all Europe, he had it in his power to have held the highest rank in the republic of letters. Yet, declining all the tempting offers which were made to him, he continued at Gottingen, anxiously endeavouring to extend the rising fame of that medical school. But after 17 years residence in that university, an ill state of health rendering him less fit for the duties of the important office which he held, he solicited and obtained permission from the regency of Hanover to return to his native city of Bern. His fellow-citizens, who might at first have fixed him among themselves, with no less honour than advantage to their city, were now as sensible as others of his superior merit. A pension was settled upon him for life, and he was nominated at different times to fill the most important offices in the state. These occupations, however, did not diminish his ardour for useful improvements. He was the first president, as well as the greatest promoter, of the Oeconomical Society at Bern; and he may be considered as the father and founder of the Orphan Hospital of that city. Declining health, however, restrained his exertions in the more active scenes of life, and for many years he was confined en-

N^o 147

tirely to his own house. Even this, however, could not put a period to his utility: for, with indefatigable industry, he continued his favourite employment of writing till within a few days of his death; which happened in the 70th year of his age, on the 12th of December 1777. His *Elementa Physiologiae* and *Bibliotheca Medicinae*, will afford, to latest posterity, undeniable proofs of his indefatigable industry, penetrating genius, and solid judgment. But he was not less distinguished as a philosopher than beloved as a man; and he was not more eminent for his improvement in every department of medical science, than for his piety to God, and benevolence to all mankind.

HALLERIA, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personatae*. The calyx is trifold; the corolla quadrid; the filaments longer than the corolla; the berry inferior and bilocular, (the fruit not yet fully described.)

HALLEY (Dr Edmund), an eminent astronomer, was the only son of a soap-boiler in London, and was born in 1656. He first applied himself to the study of the languages and sciences, but at length gave himself up wholly to that of astronomy. In 1676 he went to the island of St Helena to complete the catalogue of fixed stars, by the addition of those who lie near the south pole; and having delineated a planisphere in which he laid them all down in their exact places, he returned to England in 1678. In the year 1680 he took what is called *the grand tour*, accompanied by his friend the celebrated Mr Nelson. In the midway between Calais and Paris, Mr Halley had a sight of a remarkable comet, as it then appeared a second time that year, in its return from the sun. He had the November before seen it in its descent; and now hastened to complete his observations upon it, in viewing it from the royal observatory of France. His design in this part of his tour was, to settle a friendly correspondence between the two royal astronomers of Greenwich and Paris; and in the mean time to improve himself under so great a master as Cassini. From thence he went to Italy, where he spent great part of the year 1681; but his affairs calling him home, he returned to England. In 1683, he published his *Theory of the variation of the magnetical compass*; in which he supposes the whole globe of the earth to be a great magnet, with four magnetical poles, or points of attraction: but afterwards thinking that this theory was liable to great exceptions, he procured an application to be made to king William, who appointed him commander of the Paramour Pink, with orders to seek by observations the discovery of the rule of variations, and to lay down the longitudes and latitudes of his majesty's settlements in America.—He set out on this attempt on the 24th of November 1698: but having crossed the line, his men grew sickly; and his lieutenant mutinying, he returned home in June 1699. Having got the lieutenant tried and cashiered, he set sail a second time in September following, with the same ship, and another of less bulk, of which he had also the command. He now traversed the vast Atlantic ocean from one hemisphere to the other, as far as the ice would permit him to go; and having made his observations at St Helena, Brazil,

Halleria,
Halley.

Halley
||
Halmote.

Brazil, Cape Verd, Barbadoes, the Madeiras, the Canaries, the coast of Barbary, and many other latitudes, arrived in September 1700; and the next year published a general chart, showing at one view the variation of the compass in all those places. Captain Halley, as he was now called, had been at home little more than half a year, when he was sent by the king, to observe the course of the tides, with the longitude and latitude of the principal head-lands in the British channel; which having executed with his usual expedition and accuracy, he published a large map of the British channel. Soon after, the emperor of Germany resolving to make a convenient harbour for shipping in the Adriatic, Captain Halley was sent by queen Anne to view the two ports on the coast of Dalmatia. He embarked on the 22d of November 1702; passed over to Holland; and going through Germany to Vienna, he proceeded to Istria: but the Dutch opposing the design, it was laid aside; yet the emperor made him a present of a rich diamond-ring from his finger, and honoured him with a letter of recommendation, written with his own hand, to queen Anne. Presently after his return, he was sent again on the same business; when passing through Hanover, he supped with king George I. then electoral prince, and his sister the queen of Prussia. On his arrival at Vienna, he was the same evening presented to the emperor, who sent his chief engineer to attend him to Istria, where they repaired and added new fortifications to those of Trieste. Mr Halley returned to England in 1703; and the same year was made professor of geometry in the university of Oxford, in the room of Dr Wallis, and had the degree of doctor of laws conferred on him by that university. He is said to have lost the professorship of astronomy in that city, because he would not profess his belief of the Christian religion. He was scarcely settled at Oxford, when he began to translate into Latin from the Arabic, *Apollonius de sectione rationis*; and to restore the two books *De sectione spatii* of the same author, which are lost, from the account given of them by Pappius; and he published the whole work in 1706. Afterwards he had a share in preparing for the press Apollonius's Conics; and ventured to supply the whole eighth book, the original of which is also lost. He likewise added Serenus on the section of the cylinder and cone, printed from the original Greek, with a Latin translation, and published the whole in folio. In 1713, he was made secretary of the Royal Society; in 1720, he was appointed the king's astronomer at the royal observatory at Greenwich, in the room of Mr Flamsteed; and, in 1729, was chosen as a foreign member of the Academy of Sciences at Paris. He died at Greenwich in 1742. His principal works are, 1. *Catalogus stellarum australium*. 2. *Tabula astronomica*. 3. An abridgment of the astronomy of comets, &c. We are also indebted to him for the publication of several of the works of the great Sir Isaac Newton, who had a particular friendship for him, and to whom he frequently communicated his discoveries.

HALLEY'S Quadrant. See QUADRANT.

HALLIARDS, the ropes or tackles usually employed to hoist or lower any sail upon its respective mast or stay. See JEARS.

HALMOTE, or HALIMOTE, is the same with
VOL. VIII. Part I.

what we now call a *court-baron*, the word implying a meeting of the tenants of the same hall or manor. The name is still retained at Luston, and other places in Herefordshire. See MOTE.

HALMSTADT. See HELMSTADT.

HALO, or CORONA, in natural history, a coloured circle appearing round the body of the sun, moon, or any of the large stars. See CORONA.

HALORAGUS, in botany: A genus of the tetragynia order, belonging to the octandria class of plants. The calyx is quadrifid above; there are four petals; a dry plum, and a quadrilocular nut.

HALSTEAD, a town of Essex in England, seated on the river Coln, 45 miles from London. It has an old church, the steeple of which was once burnt down by lightning, but rebuilt at the expence of an individual, (Robert Fiske, Esq;). The town consists of about 600 pretty good houses, and is situated on a rising ground, but the streets are not paved. The inhabitants are about 4000 in number. Here is a good manufactory of says, bays, callimancoes, &c. also a good free school for 40 boys, and a very antique Bridewell. Its market on Friday is noted for corn.

HALT, in war, a pause or stop in the march of a military body.—Some derive the word from the Latin *halitus*, "breath;" it being a frequent occasion of halting to take breath: others from *alto*, because in halting they raised their pikes on end, &c.

HALTER, in the manege, a head-stall for a horse, of Hungary leather, mounted with one, and sometimes two straps, with a second throat-band, if the horse is apt to unhalter himself.

HALTER-Cast, is an excoriation of the pastern, occasioned by the halter's being entangled about the foot, upon the horse's endeavouring to rub his neck with his hinder feet. For the cure of this, anoint the place, morning and evening, with equal quantities of linseed oil and brandy, well mixed.

HALTERISTÆ, in antiquity, a kind of players at discus; denominated from a peculiar kind of discus called by the Greeks *αλτης*, and by the Latins *halter*. See DISCUS.

Some take the discus to have been a leaden weight or ball which the vaulters bore in their hands, to secure and keep themselves the more steady in their leaping. Others will have the halter to be a lump or mass of lead or stone, with an hole or handle fixed to it, by which it might be carried; and that the halteristæ were those who exercised themselves in removing these masses from place to place.

Hier. Mercurialis, in his treatise *De arte gymnastica*, l. ii. c. 12. distinguishes two kinds of halteristæ; for though there was but one halter, there were two ways of applying it. The one was to throw or pitch it in a certain manner; the other only to hold it out at arm's-end, and in this posture to give themselves divers motions, swinging the hand backwards and forwards, according to the engraven figures thereof given us by Mercurialis.—The halter was of a cylindrical figure, smaller in the middle, where it was held, by one diameter, than at the two ends. It was above a foot long, and there was one for each hand: it was either of iron, stone, or lead.

this exercise, and shows of what use it is in purging the body of peccant humours; making it equivalent both to purgation and phlebotomy.

HALTON, or HAULTON, i. e. *High Town*, a town of Cheshire, 186 miles from London. It stands on a hill, where a castle was built anno 1071, and is a member of the duchy of Lancaster; which maintains a large jurisdiction in the county round it, by the name of *Halton-Fee*, or the *honour of Halton*, having a court of record, prison, &c. within themselves. About Michaelmas every year, the king's officers of the duchy keep a law-day at the castle, which still remains a stately building; once a fortnight a court is kept here, to determine all matters within their jurisdiction; but felons and thieves are carried to the sessions at Chester, to receive their sentence. By the late inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Stafford, Warwick, Leicester, Oxford, Worcester, &c.

HALTWHISTLE, a town of Northumberland in England, situated in E. Long. 2. 0. N. Lat. 55. 0. It is pretty well built, and affords good entertainment for travellers.

HALYMOTE, properly signifies an holy or ecclesiastical court. See HALMOTE.

There is a court held in London by this name before the Lord Mayor and sheriffs, for regulating the bakers. It was anciently held on Sunday next before St Thomas's day, and for this reason called the *Halymote*, or *Holy-court*.

HALYS, (anc. geog.) the noblest river of the Hither Asia, through which it had a long course, was the boundary of Cræsus's kingdom to the east. Running down from the foot of mount Taurus, through Cataonia and Cappadocia, it divided almost the whole of the Lower Asia, from the sea of Cyprus down to the Euxine, according to Herodotus; who seems to extend its course too far. According to Strabo, himself a Cappadocian, it had its springs in the Great Cappadocia. It separated Paphlagonia from Cappadocia; and received its name *απο του αλος*, from salt, because its waters were of a salt and bitter taste, from the nature of the soil over which they flowed. It is famous for the defeat of Cræsus king of Lydia, who was misled by the ambiguous word of this oracle:

Χροισος αλυν διαβας μεγαλην αρχην διαλυσει.

If Cræsus passes over the Halys he shall destroy a great empire.

That empire was his own. See CROESUS and LYDIA.

HALYWERCFOLE, in old writers, were persons who enjoyed land, by the pious service of repairing some church, or defending a sepulchre.

This word also signified such persons in the diocese of Durham, as held their lands to defend the corps of St Cuthbert, and who from thence claimed the privilege of not being forced to go out of the bishopric.

HAM, or CHAM (anc. geog.), the country of the Zuzims (Gen. xiv. 5.), the situation whereof is not known.

HAM, the youngest son of Noah. He was the fa-

ther of Cush, Mizraim, Phut, and Canaan; each whereof had the several countries peopled by them. With respect to Ham, it is believed that he had all Africa for his inheritance, and that he peopled it with his children. As for himself, it is thought by some that he dwelt in Egypt; but M. Basnage is rather of opinion, that neither Ham nor Mizraim ever were in Egypt, but that their posterity settled in this country, and called it by the name of their ancestors. And as to Ham's being worshipped as a god, and called *Jupiter Hammon*, he thinks people may have been led into this mistake by the similitude of names; and that Jupiter Hammon was the sun, to which divine honours have been paid at all times in Egypt. However that may be, Africa is called the land of Ham, in several places of the psalms, (Psal. lxxvii. 51. civ. 23. cv. 22.) In Plutarch, Egypt is called *Chemia*; and there are some footsteps of the name of *Ham* or *Cham* observed in Ptochemmis, Psitta-chemmis, which are cantons of Egypt.

HAM, a Saxon word used for "a place of dwelling;" a village or town: hence the termination of some of our towns, *Nottingham, Buckingham, &c.* Also a home close, or little narrow meadow, is called a *ham*.

HAM, is also a part of the leg of an animal; being the inner or hind part of the knee, or the ply or angle in which the leg and thigh, when bent, incline to each other.

HAM, in commerce, &c. is used for a leg or thigh of pork, dried, seasoned, and prepared, to make it keep, and to give it a brisk agreeable flavour.

Westphalia hams, so much in vogue, are prepared by salting them with saltpetre, pressing them in a press eight or ten days, then steeping them in juniper-water, and drying them by the smoke of juniper-wood.

A ham may be salted in imitation of those of Westphalia, by sprinkling a ham of young pork with salt for one day, in order to fetch out the blood; then wiping it dry, and rubbing it with a mixture of a pound of brown sugar, a quarter of a pound of saltpetre, half a pint of bay salt, and three pints of common salt, well stirred together in an iron pan over the fire till they are moderately hot: let it lie three weeks in this salting, and be frequently turned, and then dry it in a chimney.

HAM, a city of Germany, in the circle of Westphalia, capital of the county of Mark, and subject to the king of Prussia. It is seated on the river Lippe, on the frontiers of Munster. The adjacent country abounds in corn, hemp, and flax; and the inhabitants get a good deal of money by travellers. It was formerly a Hanse-town, but is now reduced. E. Long. 7. 53. N. Lat. 51. 42.

HAM, a town of Picardy, in France, seated on the river Somme, among marshes. It has three parishes, and there is here a round tower whose walls are 36 feet thick. It was taken by the Spaniards in 1557, but restored by treaty. E. Long. 3. 9. N. Lat. 49. 45.

HAMADAN. See AMADAN.

HAMADRYADES (formed of *αμα* together, and *δρυας* dryad, of *δρυς* oak), in antiquity, certain fabulous deities revered among the ancient heathens, and believed to preside over woods and forests, and to be inclosed

Ham.
||
Hamadryades.

Hamah,
Hama-
melis.

closed under the bark of oaks. The hamadryades were supposed to live and die with the trees they were attached to; as is observed by Servius on Virgil, *Eclog. x. ver. 62.* after Mnesimachus, the scholiast of Apollonius, &c. who mentions other traditions relating thereto.

The poets, however, frequently confound the Hamadryads with the Naiads, *Napææ*, and rural nymphs in general; witness Catullus, *Carm. lxviii. ver. 23.* Ovid, *Fast. iv. 229.* Met. i. ver. 695. xiv. ver. 628. Propertius, *Eleg. xx. 32.* Virg. *Ecl. x. ver. 64.* Georg. iv. ver. 382, 383. Festus calls them *Querquetulanæ*, as being issued or sprung from oaks. An ancient poet, Phereñicus, in *Athenæus*, lib. iii. calls the vine, fig-tree, and other fruit-trees, *hamadryades*, from the name of their mother the oak.

This common idea among the ancients, of nymphs or intellectual beings annexed to trees, will account for their worshipping of trees; as we find they did, not only from their poets but their historians. Livy speaks of an ambassador's addressing himself to an old oak, as to an intelligent person and a divinity. Lib. iii. § 25.

HAMAH, a town of Turkey in Asia, in Syria, situated in E. Long. 36. 15. N. Lat. 35. 15. By some travellers it is corruptly called *Amarl* and *Amant*. Some mistake it for the ancient Apamea; but this is now called *Afamiyah*, and is situated a day's journey from Hamah. Hamah is situated among hills, and has a castle seated on a hill. It has all along been a considerable place, and in the 13th century had princes of its own. It is very large, and being seated on the ascent of a hill, the houses rise above one another, and make a fine appearance. It is however, like most other towns under the Turkish government, going to decay. Many of the houses are half ruined; but those which are still standing, as well as the mosques and castle, have their walls built of black and white stones, disposed in such manner as to form various figures. The river Assi, the ancient Orontes, runs by the side of the castle, and fills the ditches round it, which are cut very deep into the rock. This river, leaving the castle, passes through the town from south to north, and has a bridge over it, though it is pretty broad. In its course through the town it turns 18 great wheels, called by the natives *faki*, which raise great quantities of water to a considerable height, and throw it into canals supported by arches, by which means it is conveyed into the gardens and fountains. There are some pretty good bazars or market-places in Hamah, where there is a trade for linen, which is manufactured there, and sent to Tripoli to be exported into Europe.

HAMAMELIS, WITCH HAZEL: A genus of the digynia order, belonging to the tetrandria class of plants; and in the natural method ranking with those of which the order is doubtful. The involucre is triphyllous, the proper calyx tetraphyllous; there are four petals; the nut horned and bilocular. There is but one species, a native of Virginia. It hath a shrubby or woody stem, branching three or four feet high; oval, indented, alternate leaves, resembling those of common hazel; and flowers growing in clusters from the joints of the young branches, but not succeeded by seeds in this country.—The plant is hardy,

and is admitted as a variety in our gardens; but its flowers are more remarkable for their appearing in November and December, when the leaves are fallen, than for their beauty.—It may be propagated either by seeds or layers.

HAMAM LEEF, a town 12 miles east from Tunis, noted for its hot baths, which are much resorted to by the Tuniseans, and are efficacious in rheumatism and many other complaints. Here the Bey has a very fine bath, which he frequently permits the consuls and other persons of distinction to use.

HAMATH, a city of Syria, capital of a province of the same name, lying upon the Orontes. "The entering into Hamath," which is frequently spoken of in scripture, (*Josh. xiii. 5. Judges iii. 3. 2 Kings xiv. 25. and 2 Chr. vii. 8.*) is the narrow pass leading from the land of Canaan through the valley which lies between Libanus and Antilibanus. This entrance into Hamath is set down as the northern boundary of the land of Canaan, in opposition to the southern limits, the Nile or river of Egypt. Josephus, and St Jerom after him, believed Hamath to be Epiphania. But Theodoret and many other good geographers maintain it to be Emesa in Syria. Joshua (*xix. 35.*) assigns the city of Hamath to the tribe of Naphtali. Toi king of Hamath cultivated a good understanding with David, (*2 Sam. viii. 9.*) This city was taken by the kings of Judah, and retaken from the Syrians by Jeroboam the second, (*2 Kings xiv. 28.*) The kings of Assyria made themselves masters of it upon the declension of the kingdom of Israel, and transplanted the inhabitants of Hamath into Samaria, (*2 Kings xvii. 24. and xviii. 34. &c.*)

HAMAXOBII, HAMAXOBIANS, in the ancient geography, a people who had no houses, but lived in carriages. The word is formed from *μαξα* a carriage or chariot, and *βίη* life.

The *Hamaxobii*, called also *Hamaxobitæ*, were an ancient people of Sarmatia Europæa, inhabiting the southern part of Muscovy, who instead of houses had a sort of tents made of leather, and fixed on carriages to be ready for shifting and travel.

HAMB DEN (John), a celebrated patriot, descended of the ancient family of Hambden in Buckinghamshire, was born in 1594. From the university he went to the inns of court, where he made a considerable progress in the study of the law. He was chosen to serve in the parliament which began at Westminster February 5. 1626; and served in all the succeeding parliaments in the reign of Charles I. In 1636 he became universally known, by his refusal to pay ship-money, as being an illegal tax; upon which he was prosecuted, and his carriage throughout this transaction gained him a great character. When the long parliament began, the eyes of all men were fixed on him as their *pater patriæ*. On January 3. 1642, the king ordered articles of high treason and other misdemeanours to be prepared against Lord Kimbolton, Mr Hambden, and four other members of the House of Commons, and went to that house to seize them: but they were then retired. Mr Hambden afterwards made a speech in the house to clear himself of the charge laid against him. In the beginning of the wars he commanded a regiment of foot, and did good service

Hamaru

Hambden.

Hamburg. vice to the parliament at the battle of Edge-hill. He received a mortal wound in an engagement with Prince Rupert, in Chalgrave-field in Oxfordshire, and died in 1643. He is said to have had the art of Socrates to a great degree, of interrogating, and under the notion of doubts, insinuating objections, so that he infused his own opinions into those from whom he pretended to learn and receive them. He was, say his panegyrists, a very wise man and of great parts; and possessed of the most absolute spirit of popularity to govern the people, that ever was in any country: He was master over all his appetites and passions, and had thereby a very great ascendant over other men: He was of an industry and vigilance never to be tired out, of parts not to be imposed upon by the most subtle, and of courage equal to his best parts.

HAMBURG, an imperial city of Germany, seated in E. Long. 9. 40. N. Lat. 54. 0. Its name is derived from the old German word *Hamme*, signifying a wood, and *Burg*, a castle; and stands on the north-side of the river Elbe. This river is not less than four miles broad opposite the city. It forms two spacious harbours, and likewise runs through most part of it in canals. It flows above Hamburg many miles; but when the tide is accompanied with north-west winds, a great deal of damage is done by the inundations occasioned thereby. There are a great many bridges over the canals, which are mostly on a level with the streets, and some of them have houses on both sides. In the year 833, Ludovicus Pius erected Hamburg first into a bishopric, and afterwards into an archbishopric; and Adolphus III. duke of Saxony, among many other great privileges, granted it the right of fishing in the Elbe, eight miles above and below the city. The kings of Denmark, since they have succeeded to the counts of Holstein, have continually claimed the sovereignty of this place, and often compelled the citizens to pay large sums to purchase the confirmation of their liberties. Nay, it has more than once paid homage to the king of Denmark; who, notwithstanding, keeps a minister here with credentials, which is a sort of acknowledgment of its independency and sovereignty. Though Hamburg has been constantly summoned to the diet of the empire ever since the year 1618, when it was declared a free imperial city by a decree of the aulic council; yet it waves this privilege, in order to keep fair with Denmark. By their situation among a number of poor princes, the Hamburgers are continually exposed to their rapaciousness, especially that of the Danes, who have extorted vast sums from them. The city is very populous in proportion to its bulk; for though one may walk with ease round the ramparts in two hours, yet it contains, exclusive of Jews, at least 100,000 inhabitants. Here are a great many charitable foundations, the regulations of which are greatly admired by foreigners. All persons found begging in the streets are committed to the house of correction to hard labour, such as the rasping of Brazil and other kinds of wood. There is an hospital into which unmarried women may be admitted for a small sum, and comfortably maintained during the residue of their lives. The number of hospitals in this place is greater in proportion to its bigness than in any other Protestant city

in Europe. The revenue of the orphan-house alone is said to amount to between 50 and 60,000 l. There is a large sumptuous hospital for receiving poor travellers that fall sick. In one of their work-houses or houses of correction, those who have not performed their task are hoisted up in a basket over the table in the common-hall while the rest are at dinner, that they may be tantalized with the sight and smell of what they cannot taste. The established religion of Hamburg is Lutheranism; as for the Calvinists and the Roman-catholics, they go to the ambassadors chapels to celebrate their divine service and worship. They have here what they call a *private confession*, previous to the holy communion, which differs in nothing from that of the church of England, and the absolution is the same, only the poorest of the people here are forced to give a fee to the priests on these occasions. Their churches, which are ancient large fabrics, are open thoroughfares, and in some of them there are booksellers shops. The pulpit of St Catherine's is of marble, curiously carved and adorned with figures and other ornaments of gold; and its organ, reckoned one of the best in Europe, has 6000 pipes. The cathedral is very ancient, and its tower leans as if just going to fall; yet, on account of the singularity and beauty of its architecture, the danger attending it has been hitherto overlooked. There is still a dean and chapter belonging to this church, though secularized; from whose court there lies no appeal, but to the imperial chamber at Wetzlar. The chapter consists of a provost, dean, 13 canons, eight minor canons, and 30 *vicarii immunes*, besides others who are under the jurisdiction of the city. The cathedral, with the chapter, and a number of houses belonging to them, are under the immediate protection of his Britannic majesty as duke of Bremen, who disposes of the prebends that fall in six months of the year, not successively, but alternately with the chapter. Hamburg is almost of a circular form, and six miles in compass. It has six gates, and three entrances by water, *viz.* two from the Elbe and one from the Alster, being divided into the old and new, which are strongly fortified with moats, ramparts, bastions, and out-works. The ramparts are very lofty, and planted with trees; and of such a breadth, that several carriages may go a-breast. In the New town, towards Altena, are several streets of mean houses inhabited by Jews. Through that entrance from the Elbe, called *the lower Baum*, pass all ships going to or coming from sea. Every morning, at the opening of it, is seen a multitude of boats and small barks, whose cargoes consist of milk, fruits, and all kinds of provisions, rushing in at the same time. There are some fine chimes here, especially those of St Nicholas, which play every morning early, at one o'clock in the afternoon, and on all festivals and solemnities. The other public structures in this city, besides the churches, make no great appearance: however, the yard, arsenal, and two armories, are well worth seeing. There are several convents or cloisters still remaining; which having been secularized, are now possessed by the Lutherans. One of them holds its lands by this tenure, "That they offer a glass of wine to every malefactor who is carried by it for execution." There is a fine exchange, though inferior

Hamburg to that of London. It is the custom of Hamburg, that a citizen, when he dies, must leave the tenth of his estate to the city; and foreigners, not naturalized, must pay a certain sum annually for liberty to trade. The common carts here are only a long pulley laid upon an axle-tree between two wheels, and drawn not by horses, but by men, of whom a dozen or more are sometimes linked to these machines, with slings across their shoulders. Such of the senators, principal elders, divines, regular physicians, and graduates in law, as assist at funerals, have a fee. The hangman's house is the common prison for all malefactors; on whom sentence is always passed on Friday, and on Monday they are executed. As, by their laws, no criminal is punishable unless he plead guilty, they have five different kinds of torture to extort such confession. The government of this city is lodged in the senate and three colleges of burghers. The former is vested with almost every act of sovereignty, except that of laying taxes and managing the finances, which are the prerogatives of the latter. The magistracy is composed of four burgomasters, four syndics, and 24 aldermen, of whom some are lawyers and some merchants. Any person elected into the magistracy, and declining the office, must depart the place. No burgher is admitted into any of the colleges, unless he dwells in a house of his own within the city, and is possessed of 1000 rixdollars in specie, over and above the sum for which the house may be mortgaged; or 2000 in moveable goods, within the jurisdiction of the same. For the administration of justice, here are several inferior courts, from which an appeal lies to the Obergericht, or high court, and from that to the aulic council and other imperial colleges. For naval causes here is a court of admiralty, which, jointly with the city-treasury, is also charged with the care of the navigation of the Elbe, from the city to the river's mouth. In consequence of this, 100 large buoys, some white, others black, are kept constantly floating in the river in summer: but in winter, instead of some of them, there are machines, like those called *ice-beacons*, to point out the shoals and flats. Subordinate to the admiralty is a company of pilots; and at the mouth of the Elbe is, or at least ought to be, a vessel always riding, with pilots ready to put on board the ships. At the mouth of the river also is a good harbour, called *Cuxhaven*, belonging to Hamburg; a light-house; and several beacons, some of them very large. For defraying the expence of these, certain tolls and duties were formerly granted by the emperors to the city. Besides the Elbe, there is a canal by which a communication is opened with the Trave, and thereby with Lubeck and the Baltic, without the hazard, trouble, and expence, of going about by the Sound. The trade of Hamburg is exceeding great, in exporting all the commodities and manufactures of the several cities and states of Germany, and supplying them with whatever they want from abroad. Its exports consist of linens of several sorts and countries; as lawns, diapers, Osnaburgs, dowlas, &c. linen-yarn, tin-plates, iron, brass, and steel-wire, clap-board, pipe-staves, wainscot-boards, oak-plank, and timber, kid-skins, corn, beer in great quantities, with flax, honey, wax, aniseed, linseed, drugs, wine, tobacco, and metals. Its principal imports are the woollen manufactures and other goods of Great

Britain, to the amount of several hundred thousand Hamburg pounds a year: they have also a great trade with Spain, Portugal, and Italy, which is carried on mostly in English bottoms, on account of their Mediterranean passes. Their whale-fishery is also very considerable, 50 or 60 ships being generally sent out every year in this trade. Add to these a variety of manufactures, which are performed here with great success; the chief of which are, sugar-baking, calico-printing, the weaving of damasks, brocades, velvets, and other rich silks. The inland trade of Hamburg is superior to that of any in Europe, unless perhaps we should except that of Amsterdam and London. There is a paper published here at stated times called the *Preisecourant*, specifying the course of exchange, with the price which every commodity and merchandise bore last upon the exchange. There is also a board of trade, erected on purpose for the advancing every project for the improvement of commerce. Another great advantage to the merchants is, the bank established in 1619, which has a flourishing credit. To supply the poor with corn at a low price, here are public granaries, in which great quantities of grain are laid up. By charters from several emperors, the Hamburgers have a right of coinage, which they actually exercise. The English merchants, or *Hamburg company*, as it is called, enjoy great privileges; for they hold a court with particular powers, and a jurisdiction among themselves, and have a church and minister of their own.—This city has a district belonging to it of considerable extent, which abounds with excellent pastures, intermixed with several large villages and noblemens seats. A small bailiwick, called *Bergedorf*, belongs to this city and Lubeck.—Though Hamburg has an undoubted right to a seat in the diet of the empire, yet as she pays no contributions to the military chest in time of war, and is also unwilling to draw upon herself the resentment of Denmark, she makes no use of that privilege. There is a *schola illustris* or gymnasium here, well endowed, with six able professors, who read lectures in it as at the universities. There are also several free schools, and a great number of libraries, public and private. The public cellar of this town has always a prodigious stock and vent of old hock, which brings in a considerable revenue to the state. Besides the militia or trained bands, there is an establishment of regular forces, consisting of 12 companies of infantry, and one troop of dragoons, under the commandant, who is usually a foreigner, and one who has distinguished himself in the service. There is also an artillery company, and a night-guard; the last of which is posted at night all over the city, and calls the hours.

HAMEL (John Baptiste du), a very learned French philosopher and writer in the 17th century. At 18 he wrote a treatise, in which he explained in a very simple manner Theodosius's three books of Spherics; to which he added a tract upon trigonometry, extremely perspicuous, and designed as an introduction to astronomy. Natural philosophy, as it was then taught, was only a collection of vague, knotty, and barren questions; when our author undertook to establish it upon right principles, and published his *Astronomia Physica*. In 1666 Mr Colbert proposed to Louis XIV. a scheme, which was approved of by his majesty, for establishing a royal academy of sciences; and

Hamelin

Hami.

and appointed our author secretary of it. He published a great many books; and died at Paris in 1706, of mere old age, being almost 83. He was regius professor of philosophy, in which post he was succeeded by M. Varignon. He wrote Latin with purity and elegance.

HAMELIN, a strong town of Germany, in the duchy of Calenberg in Lower Saxony. It is situated at the extremity of the duchy of Brunswick, to which it is the key, near the confluence of the rivers Hamel and Weser, in E. Long. 9. 55. N. Lat. 52. 13.

HAMELLIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is quinquefid; the berry quinquelocular, inferior, polyspermous.

HAMESECKEN. BURGLARY, or *Nocturnal House-breaking*, was by the ancient English law called *Hamefecken*, as it is in Scotland to this day.—Violating the privilege of a man's house in Scotland is as severely punished as ravishing a woman.

HAMI, or HA-MI, a country of Asia, subject to the Chinese. It is situated to the north-east of China, at the extremity of that desert which the Chinese call *Chamo*, and the Tartars *Cobi*; and is only 90 leagues distant from the most westerly point of the province of Chenfi. This country was inhabited in the early ages by a wandering people, named *Iong*. About the year 950 before the Christian era, they sent deputies to pay homage to the emperor of China, and presented some fabres by way of tribute. The civil wars by which China was torn about the end of the dynasty of Tcheou having prevented assistance from being sent to these people, they fell under the dominion of the Hiong-nou, who appear to have been the same as the Huns, and who at that time were a formidable nation. The Chinese several times lost and recovered the country of Hami. In 131 (the sixth year of the reign of Chunty, of the dynasty of the eastern Han), the emperor kept an officer there in quality of governor. Under the following dynasties, the same vicissitudes were experienced: Hami was sometimes united to the province of Chenfi, sometimes independent of it, and sometimes even of the whole empire. The situation of these people (separated by vast deserts from China, to which, besides, they had no relation, either in language, manners, or customs) must have greatly contributed to facilitate these revolutions. All the tributary states of the empire having revolted in 610, that of Hami followed their example; but it again submitted to the yoke, under Tai-tsong, second emperor of the dynasty of Tang, who had sent one of his generals with an army to reduce it. This great prince paid particular attention to his new conquest. He divided it into three districts, and connected its civil and military government in such manner to that of the province of Chenfi and other neighbouring countries, that tranquillity prevailed there during his reign and several of those that followed. Through Hami all the caravans which went from the west to China, or from China to the west, were obliged to pass. The emperors, predecessors of Tai-tsong, were satisfied with causing wine to be transported from Hami in skins carried by camels; but "Tai-tsong (says the Chinese history) having subdued the kingdom of Hami, or-

dered some vine-plants of the species called *majou*, to be brought him, which he caused to be planted in his gardens; he, besides, learned the manner of making wine, the use of which proved both serviceable and hurtful to him." Luxury and effeminacy having weakened the dynasty of Tang, the Mahometans (who had made a rapid progress in all the countries that are situated between Persia, Cobi, and the Caspian sea) advanced as far as Hami, which they conquered. It appears, that this country afterwards had princes of its own, but dependent on the Tartars, who successively ruled these immense regions. The Yuen or Mogul Tartars again united the country of Hami to the province of Chenfi; and this reunion subsisted until 1360, at which time the emperor formed it into a kingdom, on condition of its princes doing homage and paying tribute. The king of Hami was honoured with a new title in 1404, and obtained a golden seal. After a contest of several years for the succession to the throne, the kingdom of Hami fell a prey to the king of Tou-culh-fan. This yoke soon became uneasy to the people of Hami: they revolted from their new masters, and made conquests from them in their turn. The new king whom they made choice of, did not long possess the throne: he was conquered and killed in a bloody battle which he fought with the king of Tou-culh-fan, who also perished some time after. Since this epocha, the country of Hami has been successively exposed to anarchy, or governed by its own princes. The prince who filled the throne in 1696, acknowledged himself a vassal of the empire, and sent as tribute to Peking camels, horses, and sabres. Kang-hi received his homage with the usual ceremonies, and published a diploma, which established the rank that the king of Hami should hold among the tributary princes, the time when he should come to render homage, the nature of the presents necessary for his tribute, the number of auxiliaries he was bound to furnish in time of war, and the manner of his appointing a successor. All these regulations have subsisted till this time.

The country of Hami, though surrounded by deserts, is accounted one of the most delightful in the world. The soil produces abundance of grain, fruits, leguminous plants, and pasture of every kind. The rice which grows here is particularly esteemed in China; and pomegranates, oranges, peaches, raisins, and prunes, have a most exquisite taste; even the jujubes are so juicy, and have so delicious a flavour, that the Chinese call them *perfumed jujubes*. There is no fruit more delicate or more in request than the melons of Hami, which are carried to Peking for the emperor's table. These melons are much more wholesome than those of Europe; and have this singular property, that they may be kept fresh during great part of the winter.—But the most useful and most esteemed production of this country is its dried raisins. These are of two kinds: The first, which are much used in the Chinese medicine, seem to have a perfect resemblance to those known in Europe by the name of Corinthian. The second, which are in much greater request for the table, are smaller and more delicate than those of Provence. The Chinese authors perfectly agree with Messrs Lemery and Geoffroy, respecting the virtue and qualities of these dried grapes or raisins; but they at-

Hami.

Hami. tribute so much more efficacy to those of Hami than to those of China, that they prescribe them in smaller doses. They observe, that an infusion of the first is of great service in facilitating an eruption of the small-pox about the fourth day, when the patient either is or seems to be too weak; and to promote a gentle perspiration in some kinds of pleurifies or malignant fevers. The dose must be varied according to the age, habit of body, and strength of the patient; great care must be taken to administer this remedy seasonably and with judgment. The emperor caused plants to be transported from Hami to Peking, which were immediately planted in his gardens. As these plants were cultivated with extraordinary care, under his own eyes, they have perfectly succeeded. The raisins produced by them are exceedingly sweet, and have a most exquisite flavour.

Although the country of Hami (the latitude of which is $42^{\circ} 53' 20''$) lies farther towards the north than several of the provinces of France, we are assured that its climate is more favourable to the culture of vines, and that it gives a superior degree of quality to the grapes. It never rains at Hami; even dew and fogs are scarcely ever seen there; the country is watered only by the snow which falls in winter, and by the water of this snow when melted, which is collected at the bottoms of the mountains, and preserved with great care and industry. The method of drying grapes in Hami is much simpler than that practised in the provinces of China. The people of Chenfi hold them over the steam of hot wine, and even sometimes boil them a few seconds in wine in which a little clarified honey has been diluted. In the kingdom of Hami they wait until the grapes are quite ripe; they then expose them to the scorching rays of the sun; afterwards pick them, and leave them in that manner until they are quite dry. However dry these grapes may be, they become shrivelled, without losing any of their substance, and without growing flat: good raisins ought to be almost as crisp as sugar-candy.

The kingdom of Hami contains a great number of villages and hamlets; but it has properly only one city, which is its capital, and has the same name. It is surrounded by lofty walls, which are half a league in circumference, and has two gates, one of which fronts the east, and the other the west. These gates are exceedingly beautiful, and make a fine appearance at a distance. The streets are straight, and well laid out; but the houses (which contain only a ground-floor, and which are almost all constructed of earth) make very little show: however, as this city enjoys a serene sky, and is situated in a beautiful plain, watered by a river, and surrounded by mountains which shelter it from the north winds, it is a most agreeable and delightful residence. On whatever side one approaches it, gardens may be seen which contain every thing that a fertile and cultivated soil can produce in the mildest climates. All the surrounding fields are enchanting: but they do not extend far; for on several sides they terminate in dry plains, where a number of beautiful horses are fed, and a species of excellent sheep, which have large flat tails that sometimes weigh three pounds. The country of Hami appears to be very abundant in fossils and valuable minerals: the Chinese have for a long time procured diamonds and a

great deal of gold from it; at present it supplies them with a kind of agate, on which they set a great value. With regard to the inhabitants of this small state, they are brave, capable of enduring fatigue, very dexterous in all bodily exercises, and make excellent soldiers; but they are fickle and soon irritated, and when in a passion they are extremely ferocious and sanguinary.

HAMILTON, a town of Scotland, in Clydesdale, seated on the river Clyde, eleven miles south east of Glasgow; from whence the noble family of Hamilton take their name, and title of duke. The town is seated in the middle of a very agreeable plain; and on the west of the town this family has a large park, which is near seven miles in circumference, inclosed with a high wall, full of deer and other game. The rivulet called *Avon* runs through the park, and falls into the river Clyde, over which last there is a bridge of free-stone. W. Long. $3. 50$. N. Lat. $55. 40$. The original name of this place, or the lands about it, was *Cadzow* or *Cad-gow*, a barony granted to an ancestor of the noble owner, on the following occasion. In the time of Edward II. lived *Sir Gilbert de Hamilton*, or *Hampton*, an Englishman of rank; who happening at court to speak in praise of Robert Bruce, received on the occasion an insult from John de Spenser, chamberlain to the king, whom he fought and slew. Dreading the resentment of that potent family, he fled to the Scottish monarch; who received him with open arms, and established him at the place possessed by the duke of Hamilton. In aftertimes the name was changed from *Cadzow* to *Hamilton*; and in 1445 the lands were erected into a lordship, and the then owner Sir James sat in parliament as lord Hamilton. The same nobleman founded the collegiate church at Hamilton in 1451, for a provost and several prebendaries. The endowment was ratified at Rome by the pope's bull, which he went in person to procure.—Hamilton-house or palace is at the end of the town; a large disagreeable pile, with two deep wings at right angles with the centre: the gallery is of great extent; and furnished, as well as some other rooms, with most excellent paintings.

HAMILTON (Anthony, count), descended from a noble family in Scotland, was born in Ireland, and settled in France. He wrote several poetical pieces; and was the first who composed romances in an agreeable taste, without imitating the burlesque of Scarron. He is also said to be the author of the *Memoirs of the count de Grammont*, one of the best written pieces in the French language. His works were printed in 6 vols 12mo. He died at St Germain-en-Laye, in 1720.

HAMILTON (George), earl of Orkney, and a brave warrior, was the fifth son of William earl of Selkirk, and early betook himself to the profession of arms. Being made colonel in 1689-90, he distinguished himself by his bravery at the battle of the Boyne; and soon after, at those of Aghrim, Steinkirk, and Landen, and at the sieges of Athlone, Limerick, and Namur. His eminent services in Ireland and Flanders, through the whole course of that war, recommended him so highly to king William III. that, in 1696, he advanced him to the dignity of a peer of Scotland, by the title of *earl of Orkney*; and his lady, the sister of Edward viscount Villiers, afterwards earl of Jersey, had a grant made to her, under the great seal of Ireland,

Hamilton.

Hamilton, land, of almost all the private estates of the late king James, of very considerable value.

Upon the accession of queen Anne to the throne, he was promoted to the rank of major-general in 1702, and the next year to that of lieutenant-general, and was likewise made knight of the thistle. His lordship afterwards served under the great duke of Marlborough; and contributed by his bravery and conduct to the glorious victories of Bleinheim and Malplaquet, and to the taking several of the towns in Flanders.

In the beginning of 1710, his lordship, as one of the 16 peers of Scotland, voted for the impeachment of Dr Sacheverel; and the same year was sworn of the privy-council, and made general of the foot in Flanders. In 1712, he was made colonel of the royal regiment of fuzileers, and served in Flanders under the duke of Ormond. In 1714, he was appointed gentleman-extraordinary of the bed-chamber to king George I. and afterwards governor of Virginia. At length he was appointed constable, governor, and captain of Edinburgh castle, lord-lieutenant of the county of Clydesdale, and field-marshal. He died at his house in Albemarle-street, in 1737.

HAMILTON (John), the 24th bishop of St Andrew's, to which he was translated from Dunkeld. He was natural son of James the first earl of Arran, and was in great favour at court whilst his friends remained in power. He was one of queen Mary's privy council, and a steady friend to that unfortunate princess. He performed the ceremony of christening her son, and was at different times lord privy seal and lord treasurer. The queen had reason to lament her not following the advice of this prelate, after the fatal battle of Langside, viz. not to trust her person in England. By the regent earl of Murray, he was declared a traitor, and obliged to seek shelter among his friends. He was unfortunately in the castle of Dumbarton when that fortress was taken by surprise, from whence he was carried to Stirling, where on April 1. 1570 he was hanged on a live tree. The two following sarcastic verses were written upon this occasion:

*Vive diu, felix arbor, semperque vireto
Fronibus, ut nobis talia poma feras.*

HAMLET, HAMEL, or *Hampfel*, (from the Saxon *ham*, i. e. *domus*, and the German *let*, i. e. *membrum*), signifies a little village, or part of a village or parish; of which three words the first is now only used, though Kitchen mentions the two last. By Spelman there is a difference between *villam integram*, *villam dimidiam*, N^o 148.

and *hamletam*; and Stow expounds it to be the seat of a freeholder. Several county-towns have hamlets, as there may be several hamlets in a parish; and some particular places may be out of a town or hamlet, though not out of the county.

HAMLET, a prince celebrated in the annals of Denmark; and whose name has been rendered familiar in this country, and his story interesting, by being the subject of one of the noblest tragedies of our immortal Shakespeare.—Adjoining to a royal palace, which stands about half a mile from that of Cronborg in Elfsineur, is a garden, which, Mr Coxe informs us, is called Hamlet's Garden, and is said by tradition to be the very spot where the murder of his father was perpetrated. The house is of modern date, and is situated at the foot of a sandy ridge near the sea. The garden occupies the side of the hill, and is laid out in terrasses rising one above another. Elfsineur is the scene of Shakespeare's Hamlet; and the original history from which our poet derived the principal incidents of his play is founded upon facts, but so deeply buried in remote antiquity that it is difficult to discriminate truth from fable. Saxo-Grammaticus, who flourished in the 12th century, is the earliest historian of Denmark that relates the adventures of Hamlet. His account is extracted, and much altered, by Belleforest a French author; an English translation of whose romance was published under the title of the History of Hamlet: and from this translation Shakespeare formed the ground-work of his play, though with many alterations and additions. The following short sketch of Hamlet's history, as recorded in the Danish annals, will enable the reader to compare the original character with that delineated by Shakespeare.

Long before the introduction of Christianity into Denmark, Horwendillus, prefect or king of Jutland, was married to Geruthra, or Gertrude, daughter of Ruric king of Denmark, by whom he had a son called *Amlethus*, or *Hamlet*. Fengo murders his brother Horwendillus, marries Gertrude, and ascends the throne. Hamlet, to avoid his uncle's jealousy, counterfeits folly; and is represented as such an abhorrer of falsehood, that though he constantly frames the most evasive and even absurd answers, yet artfully contrives never to deviate from truth. Fengo, suspecting the reality of his madness, endeavours by various methods (A) to discover the real state of his mind: amongst others, he departs from Elfsineur, conceals a meeting between Hamlet and Gertrude, concluding that the former would not conceal his sentiments from his own mother; and

(A) Among other attempts, Fengo orders his companions to leave him in a retired spot, and a young woman is placed in his way, with a view to extort from him a confession that his folly was counterfeited. Hamlet would have fallen into the snare, if a friend had not secretly conveyed to him intelligence of this treachery. He carries the woman to a more secret place, and obtains her promise not to betray him; which she readily consents to, as she had been brought up with him from her infancy. Being asked, upon his return home, if he had indulged his passion, he answers in the affirmative; but renders himself not believed by the most artful subterfuges, which, though true, seemed evidently to mark a disordered understanding, and by the positive denial of the woman. "Upon this woman," as Capell observes, "is grounded Shakespeare's Ophelia; and his deliverance from this snare by a friend suggested his Horatio:"—"the rude outlines," as Mr Malone remarks, "of those characters. But in this piece there are no traits of the character of Polonius: there is indeed a counsellor, and he places himself in the queen's chamber behind the arras; but this is the whole. The ghost of the old Hamlet is likewise the offspring of our author's creative imagination." See *Capell's School of Shakespeare*, vol. iii. p. 20.; and *Malone's Supplement*, p. 353.

Hamlet.

and orders a courtier to conceal himself, unknown to both, for the purpose of overhearing their conversation. The courtier repairs to the queen's apartment, and hides himself under a heap of straw (B). Hamlet, upon entering the cabinet, suspecting the presence of some spy, imitates, after his usual affectation of folly, the crow of a cock, and, shaking his arms like wings, jumps (C) upon the heap of straw; till, feeling the courtier, he draws his sword, and instantly dispatches him. He then cuts the body to pieces, boils it, and gives it to the hogs. He then avows to his mother that he only personated a fool, reproaches her for her incestuous marriage with the murderer of her husband; and concludes his remonstrances by saying, "Instead, therefore, of condoling my insanity, deplore your own infamy, and learn to lament the deformity of your own mind (D)." The queen is silent; but is recalled to virtue by these admonitions. Fengo returns to Elsinore, sends Hamlet to England under the care of two courtiers, and requests the king by a letter to put him to death. Hamlet discovers and alters the letter; so that, upon their arrival in England, the king orders the two courtiers to immediate execution, and betroths his daughter to Hamlet, who gives many astonishing proofs of a most transcendent understanding. At the end of the year he returns to Denmark, and alarms the court by his unexpected appearance; as a report of his death had been spread, and preparations were making for his funeral. Having re-assumed his affected insanity, he purposely wounds his fingers in drawing his sword, which the bystanders immediately fasten to the scabbard. He afterwards invites the principal nobles to an entertainment, makes them intoxicated, and in that state covers them with a large curtain, which he fastens to the ground with wooden pegs: he then sets fire to the palace; and the nobles, being in-

VOL. VIII. Part I.

veloped in the curtain, perish in the flames. During this transaction he repairs to Fengo's apartment; and, taking the sword which lay by the side of his bed, puts his own in its place: he instantly awakens and informs him, that Hamlet is come to revenge the murder of his father. Fengo starts from his bed, seizes the sword; but, being unable to draw it, falls by the hand of Hamlet. The next morning, when the populace were assembled to view the ruins of the palace, Hamlet summons the remaining nobles; and in a masterly speech, which is too long to insert in this place, lays open the motives of his own conduct, proves his uncle to have been the assassin of his father; and concludes in the following words: "Tread upon the ashes of the monster, who, polluting the wife of his murdered brother, joined incest to parricide; and ruled over you with the most oppressive tyranny. Receive me as the minister of a just revenge, as one who felt for the sufferings of his father and his people. Consider me as the person who has purged the disgrace of his country; extinguished the infamy of his mother; freed you from the despotism of a monster, whose crimes, if he had lived, would have daily increased, and terminated in your destruction. Acknowledge my services; and if I have deserved it, present me with the crown. Behold in me the author of these advantages: no degenerate person, no parricide; but the rightful successor to the throne, and the pious avenger of a father's murder. I have rescued you from slavery, restored you to liberty, and re-established your glory: I have destroyed a tyrant, and triumphed over an assassin. The recompence is in your hands: you can estimate the value of my services, and in your virtue I rest my hopes of reward." This speech has the desired effect: the greater part of the assembly shed tears, and all who are present unanimously proclaim him king amid repeated acclamations.

N n

Hamlet

(B) The reader will recollect, that straw used formerly to be spread over the floors as an article of great luxury.

(C) This part stands thus in the English account: "The counsellor entered secretly into the queene's chamber, and there hid himselfe behind the arras, and long before the queene and Hamlet came thither; who being craftie and politique, as soone as he was within the chamber, doubting some treason, and fearing if he should speak severely and wisely to his mother touching his secret practises hee should be understood, and by that means intercepted, used his ordinary manner of dissimulation, and began to come (r. crow) like a cocke, beating with his arms (in such manner as cockes used to strike with their wings) upon the hangings of the chambers; whereby feeling something stirring under them, he cried, *A rat! a rat!* and presently drawing his sword, thrust it into the hangings; which done, he pulled the counsellor (half deade) out by the heels, made an end of killing him; and, being slain, cut his body in pieces, which he caused to be boiled, and then cast it into an open vault or privie." *Malone's Supplement*, vol. i. p. 357.

(D) The closet-scene, which is so beautiful in Shakespeare's Hamlet, is thus concisely, but not less finely, described by the Danish historian: "Cumque mater magno ejulatu questa præsentis filii socordiam deslere cæpisset: 'Quid (inquit) mulierum turpissima gravissimi criminis dissimulationem falso lamenti genere expetis, quæ scorti more lasciviens nefariam ac detestabilem thori conditionem secuta viri tui interfectorem pleno incesti finu amplecteris: et ei qui prolis tuæ parentem extinxerat obscenissimis blandimentorum illecebris adularis. Ita nempe equæ conjugum suorum victoribus maritantur. Brutorum natura hæc est; ut in diversa passim coniugia rapiantur: hoc tibi exemplo prioris mariti memoriam exolevisse constat. Ego vero non ab re stolidi speciem gero, cum haud dubitem quin is qui fratrem oppresserit, in affines quoque pari crudelitate debacchaturus sit: unde stoliditatis quæ industriæ habitum amplecti præstat, et incolumitatis præsidium ab extremâ deliramentorum specie mutuari. In animo tamen paternæ ultionis studium perseverat; sed rerum occasiones aucupor, temporum opportunitates opperior. Non idem omnibus locus competit. Contra obscurum immitemque animum altioribus ingenii modis uti convenit. Tibi vero sapervacuum sit meam lamentari desipientiam, quæ tuam iustius ignominiam deplorare debueras. Itaque non aliene sed propriæ mentis vitium desleas necesse est. Cætera filere memineris.' Tali convitio laceratam matrem ad excolendum virtutis habitum revocavit, præteritosque ignes præsentibus illecebris præferre docuit."

Hammer

||
Hammock.

Hamlet soon after his elevation sails to England, and orders a shield to be made on which the principal actions of his life are represented. The king receives him with feigned demonstrations of joy, falsely assures him that his daughter is dead, and recommends him to repair to Scotland as his ambassador, and to pay his addresses to the queen Hermetruda. He gives this insidious advice with the hopes that Hamlet may perish in the attempt; as the queen, who was remarkable for her chastity and cruelty, had such an aversion to all proposals of marriage, that not one of her suitors had escaped falling a sacrifice to her vengeance. Hamlet, in opposition to all difficulties, performs the embassy; and, by the assistance of his shield, which inspires the lady with a favourable opinion of his wisdom and courage, obtains her in marriage, and returns with her to England. Informed by the princess to whom he had been betrothed that her father meditates his assassination, Hamlet avoids his fate by wearing armour under his robe; puts to death the king of England; and sails to Denmark with his two wives, where he is soon afterwards killed in a combat with Vigletus son of Ruric. Hamlet, adds the historian, was a prince, who, if his good fortune had been equal to his deserts, would have rivalled the gods in splendor, and in his actions would have exceeded even the labours of Hercules.

HAMMER, a well-known tool used by mechanics, consisting of an iron head, fixed crosswise upon a handle of wood. There are several sorts of hammers used by blacksmiths; as, 1. The hand-hammer, which is of such weight that it may be wielded or governed with one hand at the anvil. 2. The up-hand sledge, used with both hands, and seldom lifted above the head. 3. The about-sledge, which is the biggest hammer of all, and held by both hands at the farthest end of the handle; and being swung at arms length over the head, is made to fall upon the work with as heavy a blow as possible. There is also another hammer used by smiths, called a *rivetting-hammer*; which is the smallest of all, and is seldom used at the forge unless upon small work. —Carpenters and joiners have likewise hammers accommodated to their several purposes.

HAMMERING, the act of beating or extending and fashioning a body under the hammer. When it is performed on iron heated for the purpose, the smiths usually call it *forging*.

HAMMERING, in coining. A piece of money or a medal is said to be hammered when struck, and the impression given with a hammer and not with a mill.

HAMMERSMITH, four miles west from London, is a hamlet belonging to Fulham, has two charity-schools, a workhouse, a Presbyterian meeting-house, and a fair May 1. There are a number of handsome seats about it, especially towards the Thames; among which the most remarkable is the late lord Melcombe's, which is a very elegant house, and contains a marble gallery finished at a very great expence.

HAMMOCK, or HAMAC, a kind of hanging bed, suspended between two trees, posts, hooks, or the like, much used throughout the West Indies, as also on board of ships. The Indians hang their hammocks to trees, and thus secure themselves from wild beasts and insects, which render lying on the ground there very

dangerous. According to F. Plumier, who has often made use of the hammock in the Indies, it consists of a large strong coverlet or sheet of coarse cotton, about six feet square: on two opposite sides are loops of the same stuff, through which a string is run, and thereof other loops are formed, all which are tied together with a cord; and thus is the whole fastened to two neighbouring trees in the field, or two hooks in houses. This kind of couch serves at the same time for bed, quilts, sheets, pillow, &c.

The hammock used on board of ships is made of a piece of canvas six feet long and three feet wide, gathered or drawn together at the two ends. There are usually from fourteen to twenty inches in breadth allowed between decks for every hammock in a ship of war; but this space must in some measure depend on the number of the crew, &c. In time of battle the hammocks and bedding are firmly corded and fixed in the nettings on the quarter-deck, or wherever the men are too much exposed to the view or fire of the enemy.

HAMMOND (Henry), D. D. one of the most learned English divines in the 17th century, was born in 1605. He studied at Oxford, and in 1629 entered into holy orders. In 1633 he was inducted into the rectory of Penshurst in Kent. In 1643 he was made archdeacon of Chichester. In the beginning of 1645 he was made one of the canons of Christ-church, Oxford, and chaplain in ordinary to king Charles I. who was then in that city; and he was also chosen public orator of the university. In 1647 he attended the king in his confinement at Wooburn, Caversham, Hampton-Court, and the Isle of Wight, where he continued till his majesty's attendants were again put from him. He then returned to Oxford, where he was chosen sub-dean; and continued there till the parliament-visitors first ejected him, and then imprisoned him for several weeks in a private house in Oxford. During this confinement he began his Annotations on the New Testament. At the opening of the year 1660, when every thing visibly tended to the restoration of the royal family, the doctor was desired by the bishops to repair to London to assist there in the compofure of the breaches of the church, his station in which was designed to be the bishopric of Worcester; but on the 4th of April he was seized by a fit of the stone, of which he died on the 25th of that month, aged 55. Besides the above work, he wrote many others; all of which have been published together in four volumes folio.

HAMMOND (Anthony, Esq;), an ingenious English poet, descended from a good family of Somersham Place in Huntingdonshire, was born in 1668. After a liberal education at St John's college, Cambridge, he was chosen member of parliament, and soon distinguished himself as a fine speaker. He became a commissioner of the royal navy, which place he quitted in 1712. He published A Miscellany of original Poems by the most eminent hands; in which himself, as appears by the poems marked with his own name, had no inconsiderable share. He wrote the life of Walter Moyle, Esq; prefixed to his works. He was the intimate friend of that gentleman, and died about the year 1726.

HAMMOND (James), known to the world by the Love-Elegies which, some years after his death, were published

Hammer-smith,
Hammond

Hampshire. lished by the earl of Chesterfield, was the son of Anthony Hammond above mentioned, and was preferred to a place about the person of the late prince of Wales, which he held till an unfortunate accident deprived him of his senses. The cause of this calamity was a passion he entertained for a lady, who would not return it: upon which he wrote those love-elegies which have been so much celebrated for their tenderness. The editor observes, that he composed them before he was 21 years of age: a period, says he, when fancy and imagination commonly riot at the expence of judgment and correctness. He was sincere in his love as in his friendship; and wrote to his mistress, as he spoke to his friends, nothing but the genuine sentiments of his heart. Tibullus seems to have been the model our author judiciously preferred to Ovid; the former writing directly from the heart to the heart, the latter too often yielding and addressing himself to the imagination. Mr Hammond died in the year 1743, at Stow, the seat of lord Cobham, who, as well as the earl of Chesterfield, honoured him with a particular intimacy.

HAMPSHIRE, or Haunts, a county of England, bounded on the west by Dorsetshire and Wiltshire, on the north by Berkshire, on the east by Surry and Suffolk, and on the south by the English channel. It extends 55 miles in length from north to south, and 40 in breadth from east to west, and is about 220 miles in circumference. It is divided into 39 hundreds, and contains 9 forests, 29 parks, one city, 20 market-towns, 253 parishes, above 36,000 houses, and by the most modest computation 180,000 inhabitants, who elect 26 members of parliament, two for the county, two for the city of Winchester, and two for each of the following towns, Southampton, Portsmouth, Petersfield, Yarmouth, Newport, Stockbridge, Andover, Whitchurch, Lymington, Christ-church, and Newton. —The air is very pure and pleasant, especially upon the downs, on which vast flocks of sheep are kept and bred. In the champaign part of the county, where it is free of wood, the soil is very fertile, producing all kinds of grain. The country is extremely well wooded and watered; for besides many woods on private estates, in which there are vast quantities of well-grown timber, there is the new forest of great extent, belonging to the crown, well stored with venerable oaks. In these woods and forests, great numbers of hogs run at large, and feed on the acorns; and hence it is that the Hampshire bacon so far excels that of most other countries. The rivers are the Avon, Anton, Arle, Test, Stowre, and Itchin; besides several smaller streams, all abounding in fish, especially trout. As its sea-coast is of a considerable extent, it possesses many good ports and harbours, and is well supplied with salt-water fish. Much honey is produced in the country, and a great deal of mead and metheglin made. Here is also plenty of game, and on the downs is most delightful hunting. The manufacture of cloth and kerries in this county, though not so extensive as that of some others, is yet far from being inconsiderable, and employs great numbers of the poor, as well as contributes to the enriching of the manufacturers by what is sent abroad. The new intended canal in this county, from Basingstoke to the Wye in Surry, and from thence to the Thames, cannot but be a great advantage to the county in general, and the parishes it

is to pass through in particular; to carry which into *Hampshire.* execution above £.86,000 have been raised amongst 150 proprietors in 1789, and it will extend 53 miles when completed.

NEW HAMPSHIRE, a province of North America, in New England. It is bounded on the north by Quebec; north-east by the province of Main; south-east by the Atlantic Ocean; south by Massachusetts; west and north-west by Connecticut river, which divides it from Vermont. The shape of New Hampshire resembles an open fan; Connecticut river being the curve, the southern line the shortest, and the eastern line the longest side. It is divided into five counties, viz. Rockingham, Stafford, Hillsborough, Cheshire, Grafton. In 1776, there were 165 settled townships in this state. Since that time the number has been greatly increased. The chief town is PORTSMOUTH. Exeter, 15 miles southwesterly from Portsmouth, is a pretty town on the south side of Exeter river. And Concord, situated on the west side of Merrimack river, is a pleasant flourishing town, which will probably, on account of its central situation, soon be the permanent seat of government. There are two great rivers, the Piscata and the Merrimack. The former has four branches, Berwick, Cochechy, Exeter, and Durham, which are all navigable for small vessels and boats, some 15 others 20 miles from the sea. These rivers unite about eight miles from the mouth of the harbour, and form one broad, deep, rapid stream, navigable for ships of the largest burden. This river forms the only port of New Hampshire. The Merrimack bears that name from its mouth to the confluence of Pemigewasset and Winnispiokee rivers; the latter has its source in the lake of the same name. In its course, it receives numberless small streams issuing from ponds and swamps in the valleys. It tumbles over two considerable falls, Amaskaeg and Pantucket great falls. From Haveril the river runs winding along, through a pleasant rich vale of meadow, and passing between Newbury Port and Salisbury empties itself into the ocean. The land next to the sea is generally low; but as you advance into the country, it rises into hills. Some parts of the state are mountainous. The White mountains are the highest part of a ridge which extends northeast and southwest to a length not yet ascertained. The whole circuit of them is not less than 50 miles. The height of these mountains above an adjacent meadow, is reckoned to be about 5500 feet, and the meadow is 3500 feet above the level of the sea. The snow and ice cover them nine or ten months in the year; during which time they exhibit that bright appearance from which they are denominated the *white mountains*. From this summit in clear weather is exhibited a noble view, extending 60 or 70 miles in every direction. Although they are more than 70 miles within land, they are seen many leagues off at sea, and appear like an exceeding bright cloud in the horizon. These immense heights, being copiously replenished with water, afford a variety of beautiful cascades. Three of the largest rivers in New England receive a great part of their waters from these mountains. Amanoosuck and Israel rivers, two principal branches of Connecticut, fall from their western side. Peabody river, a branch of the Amariscogen, falls from the northeast side; and almost the whole of the

Hampshire. Saco descends from the southern side. The highest summit of these mountains is about latitude 44°.

The air in New Hampshire is serene and healthful. The weather is not so subject to change as in more southern climates. This state embosoming a number of very high mountains, and lying in the neighbourhood of others whose towering summits are covered with snow and ice three quarters of the year, is intensely cold in the winter season. The heat of summer is great, but of short duration. The cold braces the constitution, and renders the labouring people healthful and robust.

On the sea coast, and many places inland, the soil is sandy, but affords good pasturage. The intervals at the foot of the mountains are greatly enriched by the freshets, which bring down the soil upon them, forming a fine mould, and producing corn, grain, and herbage, in the most luxuriant plenty. The back lands which have been cultivated are generally very fertile, and produce the various kinds of grain, fruits, and vegetables, which are common to the other parts of New England. The uncultivated lands are covered with extensive forests of pine, fir, cedar, oak, walnut, &c. This state affords all the materials necessary for ship-building.

No actual census of the inhabitants has been lately made. In the convention at Philadelphia, in 1787, they were reckoned at 102,000. There is no characteristic difference between the inhabitants of this and the other New England states. The ancient inhabitants of New Hampshire were emigrants from England. Their posterity, mixed with emigrants from Massachusetts, fill the lower and middle towns. Emigrants from Connecticut compose the largest part of the inhabitants of the western towns adjoining Connecticut river. Slaves there are none. Negroes, who were never numerous in New Hampshire, are all free by the first article of the bill of rights.

In the township of Hanover, in the western part of this state, is Dartmouth College, situated on a beautiful plain, about half a mile east of Connecticut river, in latitude 43° 33'. It was named after the right honourable William Earl of Dartmouth, who was one of its principal benefactors. It was founded in 1769, for the education and instruction of youth, of the Indian tribes, in reading, writing, and all parts of learning which should appear necessary and expedient for civilizing and christianizing the children of Pagans, as well as in all liberal arts and sciences, and also of English youths and any others. Its situation, in a frontier country, exposed it during the late war to many inconveniences, which prevented its rapid progress. It flourished, however, amidst all its embarrassments, and is now one of the most growing seminaries in the United States. It has in the four classes about 130 students, under the direction of a president, two professors, and two tutors. It has 12 trustees, who are a body corporate, invested with the powers necessary for such a body. The library is elegant, containing a large collection of the most valuable books. Its apparatus consists of a competent number of useful instruments, for making mathematical and philosophical experiments. There are three buildings for the use of the students. Such is the salubrity of the air, that

no instance of mortality has happened among the students since the first establishment of the college.

At Exeter there is an academy; at Portsmouth a grammar school; and all the towns are bound by law to support schools. The inhabitants of New Hampshire are chiefly congregationalists. The other denominations are Presbyterians, Baptists, and Episcopalians.

The first discovery made by the English of any part of New Hampshire was in 1614, by Captain John Smith, who ranged the shore from Penobscot to Cape Cod; and in this route discovered the river Piscataqua. On his return to England, he published a description of the country, with a map of the coast, which he presented to prince Charles, who gave it the name of *New England*. The first settlement was made in 1623.

New Hampshire was for many years under the jurisdiction of the governor of Massachusetts, yet they had a separate legislature. They ever bore a proportionable share of the expences and levies in all enterprises, expeditions, and military exertions, whether planned by the colony or the crown. In every stage of the opposition that was made to the encroachments of the British parliament, the people, who ever had a high sense of liberty, cheerfully bore their part.

HAMPSTEAD, a pleasant village of Middlesex, four miles northwest of London, stands in a healthy air, on a fine rise, at the top of which is a heath of about a mile every way, that is adorned with several pretty seats, in a most irregular romantic situation, and has a most extensive prospect over London, into the counties all round it, viz. Bucks and Hertfordshire, and even Northamptonshire, Essex, Kent, Surry, Berks, &c. with an uninterrupted view of Shooter's Hill, Bansted-Downs, and Windsor-Castle. Its church was anciently a chapel of ease to Hendon, till about 1478. This village used to be resorted to formerly for its mineral waters, which have lately been neglected; but the wells are still frequented. It is now crowded with good buildings, even on the very steep of the hill, where there is no walking six yards together without meeting a hillock; but in the reign of Henry VIII. it was chiefly inhabited by the laundresses who washed for the Londoners. Its old ruinous church, the lord of the manor's chapel, was lately pulled down, and a new one erected in its room. There is, besides, a handsome chapel near the wells, built by the contribution of the inhabitants, who are chiefly citizens and merchants of London.

HAMPTON, a town of Gloucestershire in England, seated on the Cotswold hills, and had formerly a nunnery. W. Long. 2. 15. N. Lat. 51. 38.

HAMPTON, a town of Middlesex in England, seated on the river Thames, 12 miles west of London, and two from Richmond and Kingstown. It is chiefly famous for the royal palace there, which is the finest in Britain. It was built by cardinal Wolsey, who had 280 silk beds for strangers only, and furnished it richly with gold and silver plate. The buildings, gardens, and the two parks, to which William III. made considerable additions, are about four miles in circumference, and are watered on three sides by the Thames. The inward court, built by king William, forms a piazza, the pillars of which are so low, that it looks

more

Hamefoken more like a cloyster than a palace; however, the apartments make ample amends, being extremely magnificent, and more exactly disposed than in any other palace in the world, and adorned with most elegant furniture. Since the accession of his present majesty, however, this palace hath been much neglected, as the king has generally made choice of Windsor for his summer retreat. Those inimitable paintings by Raphael Urbin called the *cartoons*, which were placed there by king William, have been removed to the queen's palace at Westminster. For these pieces Louis XV. is said to have offered 100,000*l*.

HAMESOKEN, or **HAMESECKEN**. See **HAMESECKEN**.

HANAPER, or **HAMPER**, an office in chancery, under the direction of a master, his deputy and clerks, answering, in some measure, to the *fiscus* among the Romans.

HANAPER, (*clerk of the*) sometimes styled *warden of the hanaper*, an officer who receives all money due to the king for seals of charters, patents, commissions, and writs, and attends the keeper of the seal daily in term time, and at all time of sealing, and takes into his custody all sealed charters, patents, and the like, which he receives into bags, but anciently, it is supposed, into hampers, which gave denomination to the office.

There is also an officer who is comptroller of the hanaper.

HANAU, a town of Germany, and capital of a county of the same name, is pleasantly situated on the river Kenzig near its confluence with the Mayne. The river divides it into the old and new towns, both of which are fortified. The new town, which was built at first by French and Flemish refugees, who had great privileges granted them, is regular and handsome. The castle, in which the counts used to reside, and which stands in the old town, is fortified, and has a fine flower-garden with commodious apartments, but makes no great appearance. The Jews are tolerated here, and dwell in a particular quarter. The magistracy of the new town, and the disposal of all offices in it, belong to the French and Dutch congregations. Here is an university, with several manufactures, particularly of that of roll tobacco, and a very considerable traffic. E. Long. 9. 0. N. Lat. 49. 58.

HANAU-Munzenberg, a county of Germany. The greatest part of it is surrounded by the electorate of Mentz, the bishopric of Fulda, the lordships of Reineck, Isenburg, and Solms; as also by the territories of Hesse-Homburg, Burg-Friedburg, and Frankfort. Its length is near 40 miles, but its greatest breadth not above 12. It is exceeding fertile in corn, wine, and fruits; yielding also salt springs, with some copper, silver, and cobalt. The chief rivers are, the Mayne, the Kinzeg, and the Nidda. The prevailing religion is Calvinism, but Lutherans and Catholics are tolerated. The country is populous, and trade and manufactures flourish in it. In 1736, the whole male line of the counts of Hanau failing in John Reinard, William VIII. landgrave of Hesse Cassel, by virtue of a treaty of mutual succession between the families of Hanau and Hesse Cassel, took possession of the county, satisfaction having been first made to the house of Saxony for their claims; and in the year 1754 transferred it to prince William, eldest son to the then

hereditary prince Frederic, afterwards landgrave. The revenues of the last count, arising from this and other territories, are said to have amounted to 500,000 florins. The principal places are Hanau, Bergen, Steinau, and Glenhausen.

HAND, a part or member of the body of man, making the extremity of the arm. See **ANATOMY**, n^o 53, &c.

The mechanism of the hand is very curious; excellently contrived to fit it for the various uses and occasions we have for it, and the great number of arts and manufactures it is to be employed in. It consists of a compages of nerves, and little bones joined into each other, which give it a great degree of strength, and at the same time an unusual flexibility, to enable it to handle adjacent bodies, lay hold of them, and grasp them, in order either to draw them toward us or thrust them off. Anaxagoras is represented by ancient authors, as maintaining, that man owes all his wisdom, knowledge, and superiority over other animals, to the use of his hands. Galen represents the matter otherwise: man, according to him, is not the wisest creature, because he has hands; but he had hands given him because he was the wisest creature; for it was not our hands that taught us arts, but our reason. The hands are the organs of reason, &c.

In scripture, the word *hand* was variously applied. To pour water on any one's hand, signifies to serve him. To wash the hands was a ceremony made use of to denote innocency from murder or manslaughter. To kiss the hand was an act of adoration. To fill the hand signified taking possession of the priesthood, and performing its functions. To lean upon any one's hand was a mark of familiarity and superiority. To give the hand signifies to grant peace, swear friendship, promise security, or make alliance. The right hand was the place of honour and respect.—Amongst the Greeks and Romans it was customary for inferiors to walk on the left hand of superiors, that their right hand might be ready to afford protection and defence to their left side, which was, on account of the awkwardness of the left hand, more exposed to danger.

Imposition or *laying on of HANDS*, signifies the conferring of holy orders; a ceremony wherein the hands are laid on the head of another, as a sign of a mission, or of a power given him to exercise the functions of the ministry belonging to the order.

The apostles began to appoint missionaries by the imposition of hands. See **IMPOSITION**.

HAND, in falconry, is used for the foot of the hawk. To have a clean, strong, slender, glutinous hand, well clawed, are some of the good qualities of a hawk or falcon.

HAND, in the manege, sometimes stands for the fore-feet of a horse. It is also used for a division of the horse into two parts, with respect to the riders hand. The fore-hand includes the head, neck, and fore-quarters; the hind-hand is all the rest of the horse.

HAND is likewise used for a measure of four inches, or of a clenched fist, by which the height of a horse is computed.

HAND is also figuratively used in painting, sculpture, &c. for the manner or style of this or that master.

Hand.

Hand,
Handel.

HANDS are borne in coat-armour, *dexter* and *sinister*; that is, right and left, expanded or open; and after other manners. A bloody hand in the centre of the escutcheon is the badge of a baronet of Great Britain.

HAND-Breadth, a measure of three inches.

HANDEL (George Frederic), a most eminent master and composer of music, was born at Hall, a city of Upper Saxony in Germany. His father was a physician and surgeon of that place, and was upwards of 60 years of age when Handel was born. During his infancy young Handel is said to have amused himself with musical instruments, and to have made considerable progress before he was seven years of age, without any instructions. His propensity for music at last became so strong, that his father, who designed him for the study of the civil law, thought proper to forbid him, even at this early period of life, to touch a musical instrument, and would suffer none to remain in his house. Notwithstanding this prohibition, however, Handel found means to get a little clavichord privately conveyed to a room in the uppermost story of the house, to which room he constantly stole when the family were asleep; and thus made such advances in his art, as enabled him to play on the harpsichord. He was first taken notice of by the duke of Saxe Weisenfels on the following occasion. His father went to pay a visit to another son by a former wife, who was valet de chambre to the duke, and resided at his court. Young Handel, being then in his seventh year, earnestly desired permission to go along with him; but being refused, he followed the chaise on foot, and overtook it, the carriage being probably retarded by the roughness of the way. His father at first chid him for his disobedience, but at last took him into the chaise along with him. While he was in the duke's court, he still continued to show the same inclination for music: it was impossible to keep him from harpsichords; and he used sometimes to get into the organ-loft at church, and play after service was over. On one of these occasions, the duke happening to go out later than usual, found something so uncommon in Handel's manner of playing, that he inquired of his valet who it was; and receiving for answer that it was his brother, he desired to see him. This nobleman was so much taken with the musical genius shown by young Handel, that he persuaded his father to let him follow the bent of his inclination. He made the boy a present; and told him, that if he minded his studies, no encouragement should be wanting.

On his return to Hall, Handel was placed under one Zackaw, the organist of the cathedral church; and our young musician was even then able to supply his master's place in his absence. At nine years of age he began to compose church-services for voices and instruments, and continued to compose one such service every week for three years successively. At the age of 14, he far excelled his master, as he himself owned; and he was sent to Berlin, where he had a relation in some place about the court, on whose care and fidelity his parents could rely. The opera was then in a flourishing condition, being encouraged by the grandfather of the late king of Prussia, and under the direction of many eminent persons from Italy, among whom were Buononcini and Attilio. Buononcini, being of a haughty disposition, treated Handel with con-

tempt; but Attilio behaved to him with great kindness, and he profited much by his instructions. His abilities soon recommended him to the king, who frequently made him presents, and at last proposed to send him into Italy under his own patronage, and to take him under his immediate protection as soon as his studies should be completed. But Handel's parents not thinking proper to submit their child to the caprice of the king, declined the offer; upon which it became necessary for him to return to Hall.

Handel having now obtained ideas in music far excelling every thing that could be found in Hall, continued there very unwillingly, and it was resolved to send him into Italy: but as the expence of this journey could not then be spared, he went to Hamburg, where the opera was little inferior to that of Berlin. Soon after his arrival in this city, his father died; and his mother being left in narrow circumstances, her son thought it necessary to procure some scholars, and to accept a place in the orchestra; by which means, instead of being a burden, he became a great relief to her.

At this time, the first harpsichord in Hamburg was played by one Kefer, a man who also excelled in composition; but he, having involved himself in some debts, was obliged to abscond. Upon this vacancy, the person who had been used to play the second harpsichord claimed the first by right of succession; but was opposed by Handel, who founded a claim to the first harpsichord upon his superior abilities. After much dispute, in which all who supported or directed the opera engaged with much vehemence, it was decided in favour of Handel; but this good success had almost cost him his life. His antagonist resented the supposed affront so much, that, as they were coming out of the orchestra together, he made a push at Handel's breast with a sword, which must undoubtedly have killed him, had there not fortunately been a music-book in the bosom of his coat.

Handel, though yet but in his 15th year, became composer to the house; and the success of *Almeria*, his first opera, was so great, that it ran 30 nights without interruption. Within less than a twelvemonth after this, he set two others, called *Florinda* and *Norene*, which were received with the same applause. During his stay here, which was about four or five years, he also composed a considerable number of sonatas, which are now lost. Here his abilities procured him the acquaintance of many persons of note, particularly the prince of Tuscany, brother to John Gaston de Medicis the grand duke. This prince pressed him to go with him to Italy, where he assured him that no convenience should be wanting; but this offer Handel thought proper to decline, being resolved not to give up his independency for any advantage that could be offered him.

In the 19th year of his age, Handel took a journey to Italy on his own bottom; where he was received with the greatest kindness by the prince of Tuscany, and had at all times access to the palace of the grand duke. His Serene Highness was impatient to have something composed by so great a master; and notwithstanding the difference between the style of the Italian music and the German, to which Handel had hitherto been accustomed, he set an opera called *Rodrigo*,

Handel.

Handel. *rigo*, which pleased so well, that he was rewarded with 100 sequins and a service of plate. After staying about a year in Florence, he went to Venice, where he is said to have been first discovered at a masquerade. He was playing on a harpsichord in his visor, when Scarlatti, a famous performer, cried out, that the person who played could be none but the famous Saxon or the devil. But a story similar to this is reported of many eminent persons whose abilities have been discovered in disguise. Here he composed his opera called *Agrippina*, which was performed 27 nights successively, with the most extravagant applause.

From Venice our musician proceeded to Rome, where he became acquainted with cardinal Ottoboni and many other dignitaries of the church, by which means he was frequently attacked on account of his religion; but Handel declared he would live and die in the religion in which he had been educated, whether it was true or false. Here he composed an oratorio called *Resurrectione*, and 150 cantatas, besides some sonatas, and other music. Ottoboni also contrived to have a trial of skill between him and Dominici Scarlatti, who was considered as the greatest master on that instrument in Italy. The event is differently reported. Some say that Scarlatti was victorious, and others give the victory to Handel; but when they came to the organ, Scarlatti himself ascribed the superiority to Handel.

From Rome, Handel went to Naples; after which, he paid a second visit to Florence; and at last, having spent six years in Italy, set out for his native country. In his way thither, he was introduced at the court of Hanover with so much advantage by the baron Kilmanseck, that his Electoral Highness offered him a pension of 1500 crowns a-year as an inducement for him to continue there. This generous offer he declined on account of his having promised to visit the court of the Elector Palatine, and likewise to come over to England in compliance with the repeated invitations of the duke of Manchester. The elector, however, being made acquainted with this objection, generously ordered him to be told, that his acceptance of the pension should neither restrain him from his promise nor resolution: but that he should be at full liberty to be absent a year or more if he chose it, and to go wherever he thought fit. Soon after, the place of master of the chapel was bestowed upon Handel; and our musician having visited his mother, who was now extremely aged and blind, and his old master Zackaw, and staid some time at the court of the Elector Palatine, set out for England; where he arrived in 1710.

At that time operas were a new entertainment in England, and were conducted in a very absurd manner: but Handel soon put them on a better footing; and set a drama called *Rinaldo*, which was performed with uncommon success. Having staid a year in England, he returned to Hanover; but in 1712 he again came over to England; and the peace of Utrecht being concluded a few months afterwards, he composed a grand *Te Deum* and *Jubilate* on the occasion. He now found the nobility very desirous that he should resume the direction of the opera house in the Hay Market; and the queen having added her authority to their solicitations, and conferred on him a pension of L.200 a-year, he forgot his engagements to the elector of Ha-

nover, and remained in Britain till the death of the queen in 1714. On the arrival of king George I. Handel, conscious of his ill behaviour, durst not appear at court; but he was extricated from his dilemma by the baron Kilmanseck. Having engaged several of the English nobility in his behalf, the baron persuaded the king to a party of pleasure on the water. Handel was apprised of the design, and ordered to prepare some music for the occasion. This he executed with the utmost attention, and on the day appointed it was performed and conducted by himself. The king with pleasure and surprise inquired whose it was, and how the entertainment came to be provided without his knowledge. The baron then produced the delinquent; and asked leave to present him to his majesty as one too sensible of his fault to attempt an excuse, but sincerely desirous to atone for it. This intercession was accepted. Handel was restored to favour, his water music was honoured with the highest approbation, and the king added a pension of L.200 a-year to that formerly bestowed on him by queen Anne; which he soon after increased to L.400, on his being appointed to teach the young princesses music.

In the year 1715, Handel composed his opera of *Admige*; but from that time to the year 1720 he composed only *Teseo* and *Pastor Fido*, Buononcini and Attilio being then composers for the operas. About this time a project was formed by the nobility for erecting a kind of academy at the Hay Market, with a view to secure to themselves a constant supply of operas to be composed by Handel, and performed under his direction. No less than L. 50,000 was subscribed for this scheme, of which the king himself subscribed L.1000, and it was proposed to continue the undertaking for 14 years. Handel went over to Dresden, in order to engage singers, and returned with Senesino and Durisanti. Buononcini and Attilio had still a strong party in their favour, but not equal to that of Handel; and therefore in 1720 he obtained leave to perform his opera of *Radamisso*. The house was so crowded, that many fainted through excessive heat; and 40s. were offered by some for a seat in the gallery, after having in vain attempted to get one elsewhere. The contention, however, still ran very high between Handel's party and that of the two Italian masters; and at last it was determined that the rivals should be jointly employed in making an opera, in which each should take a distinct act, and he who by the general suffrage was allowed to have given the best proof of his abilities should be put in possession of the house. This opera was called *Muzio Scevola*, and Handel set the last act. It is said that Handel's superiority was owned even in the overture before it; but when the act came to be performed, there remained no pretence of doubt or dispute. The academy was now therefore firmly established, and Handel conducted it for nine years with great success; but about that time an irreconcilable enmity took place between Handel himself and Senesino. Senesino accused Handel of tyranny, and Handel accused Senesino of rebellion. The merits of the quarrel are not known: the nobility, however, became mediators for some time; and having failed in that good design, they became parties in the quarrel. Handel was resolved to dismiss Senesino, and the nobility seemed also resolved not to permit him to do so. The haughtiness of Handel's

Handel. Handel's temper would not allow him to yield, and the affair ended in the total dissolution of the academy.

Handel now found that his abilities, great as they were, could not support him against the powerful opposition he met with. After the dismissal of Senesino, his audience sensibly dwindled away, and Handel entered into an agreement with Mr Heidegger to carry on operas in conjunction with him. New singers were engaged from Italy; but the offended nobility raised a subscription against him, to carry on operas in the playhouse in Lincoln's-Inn fields. Handel bore up four years against this opposition; three in partnership with Heidegger, and one by himself: but though his musical abilities were superior to those of his antagonists, the astonishing powers of the voice of Farinelli, whom the opposite party had engaged, determined the victory against him. At last Handel, having spent all he was worth in a fruitless opposition, thought proper to desist. His disappointment had such an effect upon him, that for some time he was disordered in his understanding, and at the same time his right arm was rendered useless by a stroke of the palsy. In this deplorable situation, it was thought necessary that he should go to the baths of Aix-la-Chapelle; and from them he received such extraordinary and sudden relief, that his cure was looked upon by the nuns as miraculous.

In 1736, Handel again returned to England; and soon after his return his Alexander's Feast was performed with applause at Covent Garden. The success and splendor of the Hay Market was by this time so much reduced by repeated mismanagements, that lord Middlesex undertook the direction of it himself, and once more applied to Handel for composition. He accordingly composed two operas called *Faromondo*, and *Alessandro Severo*, for which in 1737 he received L.1000. In 1738 he received L.1500 from a single benefit, and nothing seemed wanting to retrieve his affairs, excepting such concessions on his part as his opponents had a right to expect. These concessions, however, he could not be prevailed upon to make; and that he might no longer be under obligations to act as he was directed by others, he refused to enter into any engagements upon subscription. After having tried a few more operas at Covent Garden without success, he introduced another species of music called *oratorios*, which he thought better suited to the native gravity of an English audience. But as the subjects of these pieces were always taken from sacred history, it was by some thought to be a profanation to set them to music and perform them at a playhouse. In consequence of this prejudice, the oratorios met with very indifferent success; and in 1741 Mr Handel found his affairs in such a bad situation, that he was obliged to quit England, and go to Dublin.

He was received in Ireland in a manner suitable to his great merit; and his performing his oratorio called the *Messiah*, for the benefit of the city-prison, brought him into universal favour. In nine months time he had brought his affairs into a better situation; and on his return to England in 1742, he found the public much more favourably disposed. His oratorios were now performed with great applause: his *Messiah*, which before had been but coldly received, became a favourite performance; and Handel, with a generous humanity, de-

N^o 148.

M

Handel. terminated to perform it annually for the benefit of the foundling hospital, which at that time was only supported by private benefactions. In 1743, he had a return of his paralytic disorder; and in 1751 became quite blind by a *gutta serena* in his eyes. This last misfortune for some time sunk him into the deepest despondency; but at last he was obliged to acquiesce in his situation, after having without any relief undergone some very painful operations. Finding it now impossible to manage his oratorios alone, he was assisted by Mr Smith, who at his request frequently played for him, and conducted them in his stead; and with this assistance they were continued till within eight days of his death. During the latter part of his life, his mind was often disordered; yet at times it appears to have resumed its full vigour, and he composed several songs, choruses, &c. which from their dates may be considered almost as the last sounds of his dying voice. From about October 1758 his health declined very fast; his appetite, which had been remarkably keen, and which he had gratified to a great degree, left him; and he became sensible of the approach of death. On the 6th of April 1759, his last oratorio was performed, at which he was present, and died on the 14th of the same month. On the 20th he was buried by the right reverend Dr Pearce, bishop of Rochester, in Westminster abbey; where, by his own order, and at his own expence, a monument was erected to his memory.

With regard to the character of this most eminent musician, he is universally allowed to have been a great epicure: In his temper he was very haughty, but was seldom or never guilty of mean actions. His pride was uniform; he was not by turns a tyrant and a slave. He appears to have had a most extravagant love for liberty and independence; insomuch, that he would, for the sake of liberty, do things otherwise the most prejudicial to his own interest. He was liberal even when poor, and remembered his former friends when he was rich. His musical powers can perhaps be best expressed by Arbuthnot's reply to Pope, who seriously asked his opinion of him as a musician; "Conceive (said he) the highest you can of his abilities, and they are much beyond any thing you can conceive."

Commemoration of HANDEL; a musical exhibition instituted some years ago, and the grandest of the kind ever attempted in any nation. Of the rise and progress of the design, together with the manner in which the first celebration was executed, an accurate and authentic detail is given, as might be expected, by Dr Burney in the 4th and last volume of his History of Music, from which the following account is extracted.

"In a conversation between lord viscount Fitzwilliam, Sir Watkin Williams Wynn, and Joah Bates, Esq; commissioner of the victualing-office, the beginning of last year, 1783, at the house of the latter; after remarking that the number of eminent musical performers of all kinds, both vocal and instrumental, with which London abounded, was far greater than in any other city of Europe, it was lamented that there was no public periodical occasion for collecting and consolidating them into one band; by which means a performance might be exhibited on so grand and magnificent a scale as no other part of the world could equal. The birth and death of Handel naturally occurred to three

Handel, three such enthusiastic admirers of that great master; and it was immediately recollected, that the next year (1784) would be a proper time for the introduction of such a custom, as it formed a complete century since his birth, and an exact quarter of a century since his decease.

"The plan was soon after communicated to the governors of the Musical Fund, who approved it, and promised their assistance. It was next submitted to the directors of the concert of Ancient Music; who, with an alacrity which does honour to their zeal for the memory of the great artist Handel, voluntarily undertook the trouble of managing and directing the celebrity. At length, the design coming to the knowledge of the king, it was honoured with his majesty's sanction and patronage. Westminster abbey, where the bones of the great musician were deposited, was thought the properest place for the performance; and application having been made to the bishop of Rochester for the use of it, his lordship, finding that the scheme was honoured with the patronage of his majesty, readily consented; only requesting, as the performance would interfere with the annual benefit for the Westminster Infirmary, that part of the profits might be appropriated to that charity, as an indemnification for the loss it would sustain. To this the projectors of the plan acceded; and it was afterwards settled, that the profits of the first day's performance should be equally divided between the Musical Fund and the Westminster Infirmary; and those of the subsequent days be solely applied to the use of that fund which Handel himself so long helped to sustain, and to which he not only bequeathed a thousand pounds, but which almost every musician in the capital annually contributes his money, his performance, or both, to support. Application was next made to Mr James Wyatt, the architect, to furnish plans for the necessary decorations of the abbey; drawings of which having been shown to his majesty, were approved. The general idea was to produce the effect of a royal musical chapel, with the orchestra terminating one end, and the accommodation for the royal family, the other. The arrangement of the performance of each day was next settled; and it was at his majesty's instigation that the celebrity was extended to three days instead of two, which he thought would not be sufficient for the display of Handel's powers, or fulfilling the charitable purposes to which it was intended to devote the profits. It was originally intended to have celebrated this festival on the 20th, 22d, and 23d of April; and the 20th being the day of the funeral of Handel, part of the music was, in some measure, so selected as to apply to that incident. But, in consequence of the sudden dissolution of parliament, it was thought proper to defer the festival to the 26th, 27th, and 29th of May, which seems to have been for its advantage: as many persons of tender constitutions, who ventured to go to Westminster Abbey in warm weather, would not have had the courage to go thither in cold. Impressed with a reverence for the memory of Handel, no sooner was the project known, but most of the practical musicians in the kingdom eagerly manifested their zeal for the enterprise; and many of the most eminent professors, waving all claims to precedence in the band, offered to perform in any subor-

dinate station in which their talents could be most useful.

"In order to render the band as powerful and complete as possible, it was determined to employ every species of instrument that was capable of producing grand effects in a great orchestra and spacious building. Among these the *facbut*, or double trumpet, was sought; but so many years had elapsed since it had been used in this kingdom, that neither the instrument, nor a performer upon it, could easily be found. It was, however, discovered, after much useless enquiry, not only here, but by letter, on the continent; that in his majesty's military band there were six musicians who played the three several species of *facbut*, *tenor*, *base*, and *double base*.

"The double bassoon, which was so conspicuous in the orchestra, and powerful in its effect, is likewise a tube of 16 feet. It was made, with the approbation of Mr Handel, by Stainsby the flute-maker, for the coronation of his late majesty George II. The late ingenious Mr Lampe, author of the justly admired music of *The Dragon of Wantley*, was the person intended to perform on it; but, for want of a proper reed, or for some other cause, at present unknown, no use was made of it at that time; nor indeed, tho' it has been often attempted, was it ever introduced into any band in England till now, by the ingenuity and perseverance of Mr Ashly, of the Guards.

"The double-base kettle-drums were made from models of Mr Ashbridge, of Drury Lane orchestra, in copper, it being impossible to procure plates of brass large enough. The Tower drums, which, by permission of his grace the duke of Richmond, were brought to the abbey on this occasion, are those which belong to the ordnance stores, and were taken by the duke of Marlborough at the battle of Malplaquet in 1709. These are hemispherical, or a circle divided; but those of Mr Ashbridge are more cylindrical, being much longer, as well as more capacious, than the common kettle-drum; by which he accounts for the superiority of their tone to that of all other drums. These three species of kettle-drums, which may be called *tenor*, *base*, and *double base*, were an octave below each other.

"The excellent organ, erected at the west end of the abbey, for the commemoration performances only, is the workmanship of the ingenious Mr Samuel Green in Islington. It was fabricated for the cathedral of Canterbury; but before its departure for the place of its destination, it was permitted to be opened in the capital on this memorable occasion. The keys of communication with the harpsichord, at which Mr Bates the conductor was seated, extended 19 feet from the body of the organ, and 20 feet 7 inches below the perpendicular of the set of keys by which it is usually played. Similar keys were first contrived in this country for Handel himself at his oratorios; but to convey them to so great a distance from the instrument, without rendering the touch impracticably heavy, required uncommon ingenuity and mechanical resources.

"In celebrating the disposition, discipline, and effects of this most numerous and excellent band, the merit of the admirable architect, who furnished the elegant designs for the orchestra and galleries, must not be forgotten; as, when filled, they constituted one of the grandest and most magnificent spectacles which

Handel. imagination can delineate. All the preparations for receiving their majesties, and the first personages in the kingdom, at the east end; upwards of 500 musicians at the west; and the public in general, to the number of between 3000 and 4000 persons, in the area and galleries; so wonderfully corresponded with the style of architecture of this venerable and beautiful structure, that there was nothing visible either for use or ornament, which did not harmonize with the principal tone of the building, and which may not metaphorically have been said to have been in perfect tune with it. But, besides the wonderful manner in which this construction exhibited the band to the spectators, the orchestra was so judiciously contrived, that almost every performer, both vocal and instrumental, was in full view of the conductor and leader; which accounts, in some measure, for the uncommon ease with which the performers confess they executed their parts.

“ At the east end of the aisle, just before the back of the choir-organ, some of the pipes of which were visible below, a throne was erected in a beautiful Gothic style, corresponding with that of the abbey, and a center box, richly decorated and furnished with crimson satin, fringed with gold, for the reception of their majesties and the royal family: on the right hand of which was a box for the bishops, and, on the left, one for the dean and chapter of Westminster; immediately below these two boxes were two others, one on the right for the families and friends of the directors, and the other for those of the prebendaries of Westminster. Immediately below the king's box was placed one for the directors themselves, who were all distinguished by white wands tipped with gold, and gold medals, struck on the occasion, appending from white ribbands. These their majesties likewise condescended to wear at each performance. Behind, and on each side of the throne, there were seats for their majesties suite, maids of honour, grooms of the bed-chamber, pages, &c.—The orchestra was built at the opposite extremity, ascending regularly from the height of seven feet from the floor to upwards of forty from the base of the pillars, and extending from the centre to the top of the side aisle.—The intermediate space below was filled up with level benches, and appropriated to the early subscribers. The said aisles were formed into long galleries ranging with the orchestra, and ascending so as to contain 12 rows on each side: the fronts of which projected before the pillars, and were ornamented with festoons of crimson morine.—At the top of the orchestra was placed the occasional organ, in a Gothic frame, mounting to, and mingling with, the saints and martyrs represented in the painted glass on the west window. On each side of the organ, close to the window, were placed the kettle-drums described above. The choral bands were principally placed in view of Mr Bates, on steps seemingly ascending into the clouds, in each of the side aisles, as their termination was invisible to the audience. The principal singers were ranged in the front of the orchestra, as at oratorios, accompanied by the choirs of St Paul, the abbey, Windsor, and the chapel royal.

“ Few circumstances will perhaps more astonish veteran musicians, than to be informed, that there was but one general rehearsal for each day's performance: an indisputable proof of the high state of cultivation

to which practical music is at present arrived in this country; for if good performers had not been found ready made, a dozen rehearsals would not have been sufficient to make them so. Indeed, Mr Bates, in examining the list of performers, and enquiring into their several merits, suggested the idea of what he called a *drilling rehearsal*, at Tottenham-street Concert Room, a week before the performance; in order to hear such volunteers, particularly chorus singers, as were but little known to himself, or of whose abilities his assistant was unable to speak with certainty. At this rehearsal, though it consisted of 120 performers, not more than two of that number were desired to attend no more.

“ At the general rehearsal in the abbey, mentioned above, more than 500 persons found means to obtain admission, in spite of every endeavour to shut out all but the performers; for fear of interruption, and perhaps of failure in the first attempts at incorporating and consolidating such a numerous band: consisting not only of all the regulars, both native and foreign, which the capital could furnish, but of all the irregulars, that is, dilettanti, and provincial musicians of character, who could be mustered, many of whom had never heard or seen each other before. This intrusion, which was very much to the dissatisfaction of the managers and conductor, suggested the idea of turning the eagerness of the public to some profitable account for the charity, by fixing the price of admission to half a guinea for each person.

“ But, besides the profits derived from subsequent rehearsals, the consequences of the first were not without their use: for the pleasure and astonishment of the audience, at the small mistakes, and great effects of this first experiment, which many had condemned by anticipation, were soon communicated to the lovers of music throughout the town, to the great increase of subscribers and solicitors for tickets. For though the friends of the directors were early in subscribing, perhaps from personal respect, as much as expectation of a higher musical repast than usual; yet the public in general did not manifest great eagerness in securing tickets till after this rehearsal, Friday May 21. which was reported to have astonished even the performers themselves by its correctness and effects. But so interesting did the undertaking become by this favourable rumour, that from the great demand of tickets it was found necessary to close the subscription.

“ Many families, as well as individuals, were attracted to the capital by this celebrity; and it was never remembered to have been so full, except at the coronation of his present majesty. Many of the performers came, unsolicited, from the remotest parts of the kingdom at their own expence: some of them, however, were afterwards reimbursed, and had a small gratuity in consideration of the time they were kept from their families by the two unexpected additional performances.

“ Foreigners, particularly the French, must be much astonished at so numerous a band moving in such exact measure, without the assistance of a Coryphæus to beat the time, either with a roll of paper, or a noisy baton, or truncheon. Rousseau says, that ‘the more time is beaten, the less it is kept;’ and it is certain, that when the measure is broken, the fury of the musical

Hanging.

fical general or director, increasing with the disobedience and confusion of his troops, he becomes more violent, and his strokes and gesticulations more ridiculous in proportion to their disorder.

“As this commemoration is not only the first instance of a band of such magnitude being assembled together, but of any band at all numerous, performing in a similar situation, without the assistance of a conductor to regulate the measure, the performances in Westminster abbey may be safely pronounced no less remarkable for the multiplicity of voices and instruments employed, than for accuracy and precision. When all the wheels of that huge machine, the orchestra, were in motion, the effect resembled clock-work in every thing but want of feeling and expression. And as the power of gravity and attraction in bodies is proportioned to their mass and density, so it seems as if the magnitude of this band had commanded and impelled adhesion and obedience beyond that of any other of inferior force. The pulsations in every limb, and ramifications of veins and arteries in an animal, could not be more reciprocal, isochronous, and under the regulation of the heart, than the members of this body of musicians under that of the conductor and leader. The totality of sound seemed to proceed from one voice and one instrument; and its powers produced not only new and exquisite sensations in judges and lovers of the art, but were felt by those who never received pleasure from music before. These effects, which will be long remembered by the present public, perhaps to the disadvantage of all other choral performances, run the risk of being doubted by all but those who heard them, and the present description of being pronounced fabulous if it should survive the present generation.”

HANG-TCHEOU-FOU, the metropolis of the province of Tche-kiang in China. See Tche-kiang.—It is, according to the Chinese, the paradise of the earth; and may be considered as one of the richest, best situated, and largest cities of the empire. It is four leagues in circumference, exclusive of its suburbs; and the number of its inhabitants amounts to more than a million. It is computed, that there are a thousand workmen within its walls employed in manufacturing silk: what renders this city delightful, is a small lake, called *Si-hou*, which washes the bottom of its walls on the western side; its water is pure and limpid, and its banks are almost every where covered with flowers. Halls and open galleries, supported by pillars, and paved with large flag stones, have been erected here on piles, for the convenience of those who are fond of walking; causeways, cased with cut stone, traverse the lake in different directions; and the openings which are left in them at intervals, for the passage of boats, are covered by handsome bridges. In the middle of the lake are two islands, to which company generally resort after having amused themselves with rowing, and in which a temple and several pleasure-houses have been built for their reception. The emperor has a small palace in the neighbourhood. This city has a garrison of 3000 Chinese, under the command of the viceroy, and 3000 Tartars, commanded by a general of the same nation. It has under its jurisdiction seven cities of the second and third class.

HANGING, a common name given to the method of inflicting death on criminals by suspending

them by the neck.—Physicians are not agreed as to the manner in which death is brought on by hanging. De Haen hanged three dogs, whom he afterwards opened. In one, nothing remarkable appeared in the lungs. In another, from whom half an ounce of blood was taken from the jugular vein, the dura and pia mater were of the natural appearance; but the lungs were much inflamed. In the third, the meninges were found, and there was no effusion of blood in the ventricles of the brain, but the left lobe of the lungs was turgid with blood. Wepfer, Littræus, Alberti, Bruhierius, and Boerhaave, affirm that hanged animals die apoplectic. Their arguments for this are chiefly drawn from the livid colour of the face; from the turgescency of the vessels of the brain; the inflammation of the eyes; and from the sparks of fire which those who have survived hanging allege they have seen before their eyes. On the contrary, Bonetus, Petit, Haller, and Lancisi, from observing that death is occasioned by any small body falling into the glottis, have ascribed it to the stoppage of respiration. Others, deeming both these causes ill-founded, have ascribed it to a luxation of the vertebræ of the neck.—Dr Haen adduces the authority of many eminent authors to prove the possibility of recovering hanged persons; and observes, in general, that with bleeding in the jugular vein, and anointing the neck with warm oil, the same remedies are to be employed in this case as for the recovery of drowned people. See DROWNING.

HANGINGS, denote any kind of drapery hung up against the walls or wainscoting of a room.

Paper-HANGINGS. See *PAPER-Hangings*.

Wove HANGINGS. See *TAPESTRY*.

HANGCLIFF, a remarkable point of land on the east coast of the largest of the Shetland Islands. It is frequently the first land seen by ships in northern voyages. Captain Phipps determined its situation to be in W. Long. $0^{\circ} 56' 30''$. N. Lat. $60^{\circ} 9'$.

HANNIBAL, a famous Carthaginian general, of whose exploits an account is given under the articles *CARTHAGE* and *ROME*. After having had the misfortune to lose a sea-fight with the Rhodians, through the cowardice of Apollonius one of the admirals of Antiochus the Great, he was forced to fly into Crete, to avoid falling into the hands of the Romans. On his arrival in this island, he took sanctuary among the Gortynii; but as he had brought great treasure along with him, and knew the avarice of the Cretans, he thought proper to secure his riches by the following stratagem. He filled several vessels with melted lead, just covering them over with gold and silver. These he deposited in the temple of Diana, in the presence of the Gortynii, with whom, he said, he trusted all his treasure: Justin tells us, that he left this with them as a security for his good behaviour, and lived for some time very quietly in these parts. He took care, however, to conceal his riches in hollow statues of brass; which, according to some, he always carried along with him; or, as others will have it, exposed in a public place as things of little value. At last he retired to the court of Prusias king of Bithynia, where he found means to unite several of the neighbouring states with that prince into a confederacy against Eumenes king of Pergamus, a professed friend to the Romans; and during the ensuing war gave Eumenes se-

Hannibal.

Hannibal. veral defeats, more through the force of his own genius than the valour of his troops. The Romans having received intelligence of the important services performed by Hannibal, immediately dispatched T. Quintius Flaminius as an ambassador to Prusias, in order to procure his destruction. At his first audience, he complained of the protection given to that famous general, representing him "as the most inveterate and implacable enemy the Romans ever had; as one who had ruined both his own country and Antiochus, by drawing them into a destructive war with Rome."—Prusias, in order to ingratiate himself with the Romans, immediately sent a party of soldiers to surround Hannibal's house, that he might find it impossible to make his escape. The Carthaginian, having before discovered that no confidence was to be reposed in Prusias, had contrived seven secret passages from his house, in order to evade the machinations of his enemies, even if they should carry their point at the Bithynian court. But guards being posted at these, he could not fly, though, according to Livy, he attempted it. Perceiving, therefore, no possibility of escaping, he had recourse to poison, which he had long reserved for such a melancholy occasion. Then taking it in his hand, "Let us (said he) deliver the Romans from the inquietude with which they have long been tortured, since they have not patience to wait for an old man's death. Flaminius will not acquire any reputation or glory by a victory gained over a betrayed and defenceless person. This single day will be a lasting testimony of the degeneracy of the Romans. Their ancestors gave Pyrrhus intelligence of a design to poison him, that he might guard against the impending danger, even when he was at the head of a powerful army in Italy; but they have deputed a person of consular dignity to excite Prusias impiously to murder one who has taken refuge in his dominions, in violation of the laws of hospitality." Then having denounced dreadful imprecations against Prusias, he drank the poison, and expired at the age of 70 years. Cornelius Nepos acquaints us, that he put an end to his life by a subtle poison which he carried about with him in a ring. Plutarch relates, that, according to some writers, he ordered a servant to strangle him with a cloak wrapped about his neck; and others say, that, in imitation of Midas and Themistocles, he drank bull's blood.

With respect to the character of this general, it appears to have been in military affairs what Demosthenes was in oratory, or Newton in mathematics; namely, absolutely perfect, in which no human wisdom could discover a fault, and to which no man could add a perfection. Rollin hath contrasted his character with that of Scipio Africanus. He enumerates the qualities which make a complete general; and having then given a summary of what historians have related concerning both commanders, is inclined to give the preference to Hannibal. "There are, however (he says), two difficulties which hinder him from deciding; one drawn from the characters of the generals whom Hannibal vanquished; the other from the errors he committed. May it not be said (continues our author), that those victories which made Hannibal so famous, were as much owing to the imprudence and temerity of the Roman generals, as to his bravery and skill?

When a Fabius and a Scipio were sent against him, the first stopped his progress, the other conquered him." **Hannibal, Hanno.**

These reasons have been answered by Mr Hooke, who hath taken some pains to vindicate Hannibal's character, by fully and fairly comparing it with that of Scipio Africanus, and other Roman commanders. "I do not see (says he) why these difficulties should check our author's inclination to declare in favour of the Carthaginian. That Fabius was not beaten by Hannibal, we cannot much wonder, when we remember how steadily the old man kept to his resolution never to fight with him. But from Fabius's taking this method to put a stop to the victories of the enemy, may we not conclude that he knew no other, and thought Hannibal an overmatch for him? And why does our author forget Publius Scipio (Africanus's father), a prudent and able general, whom Hannibal vanquished at the Ticin? Livy relates some victories of Hannibal over the celebrated Marcellus; but neither Marcellus nor any other general ever vanquished Hannibal before the battle of Zama, if we may believe Polybius (lib. xv. c. 16.). Terentius Varro, indeed, is represented as a headstrong rash man; but the battle of Cannæ was not lost by his imprudence. The order in which he drew up his army is no where condemned; and Chevalier Folard thinks it excellent. And as to the conduct of the battle, Æmilius Paulus, a renowned captain, and a disciple of Fabius, had a greater share in it than his colleague. The imprudence with which Varro is taxed, was his venturing, contrary to his colleague's advice, with above 90,000 men to encounter in a plain field an enemy who had only 50,000, but was superior in horse. And does not the very advice of Æmilius, and the charge of temerity on Varro for not following it, imply a confession of Hannibal's superiority in military skill over Æmilius as well as Varro? It ought likewise to be observed, that Hannibal's infantry had gained the victory over the Roman infantry, before this latter suffered any thing from the Carthaginian cavalry. It was otherwise when Scipio gained the victory at Zama. His infantry would probably have been vanquished but for his cavalry. Hannibal, with only his third line of foot (his Italian army), maintained a long fight against Scipio's three lines of foot; and seems to have had the advantage over them, when Masinissa and Lælius, with the horse, came to their assistance. Polybius indeed says, that Hannibal's Italian forces were equal in number to all Scipio's infantry; but this is contradicted by Livy, and is not very probable. The authority of Polybius, who was an intimate friend of Scipio Æmilianus, is, I imagine, of little weight in matters where the glory of the Scipios is particularly concerned. His partiality and flattery to them are, in many instances, but too visible."

Our author then proceeds to show, that Hannibal was not guilty of any of the faults laid to his charge as a general; and having contrasted the moral characters of the two generals with each other, makes it evident, that as a man, as well as a general, Hannibal had greatly the advantage of his rival. See *Hooke's Roman history*, vol. iv. p. 151. & seq.

HANNO, general of the Carthaginians, was commanded to sail round Africa. He entered the ocean through

Hanover. through the Straits of Gibraltar, and discovered several countries. He would have continued his navigation, had it not been for want of provisions. He wrote an account of his voyage, which was often quoted, but not much credited. Sigismund Gelenius published it in Greek at Basil, by Frobenius, in 1533. He lived, according to Pliny, when the affairs of the Carthaginians were in the most flourishing condition; but this is a very indeterminate expression.

HANOVER, an electoral state of Germany, of which the king of Great Britain is elector.—Though the house of Hanover is the last that has been raised to the electoral dignity in the empire, it may vie with any in Germany for the antiquity and nobleness of its family. It is likewise very considerable for the extent of its territories, which at present are, The duchy of Calenberg, in which are the cities of Hanover, Calenberg, Hamelen, Neustadt, Gottingen, &c.; the duchy of Grubenhagen, the county of Diepholt, the county of Iloga, in the bishoprick of Hildesheim; the bailiages of Coldingen, Luther, Badenburg, and Weltershoven, with the right of protection of the city of Hildesheim; and the county of Danneberg, ceded by the dukes of Wolfenbüttele to the dukes of Lunenburg, as an equivalent for their pretensions on the city of Brunswic. The elector possesses likewise the county of Delmenhorst, and the duchies of Bremen and Verden, sold by the king of Denmark in 1715: the right of possessing alternatively the bishopric of Osnabruck belongs solely to the electoral branch; but if it shall happen to fail, the dukes of Wolfenbüttele are to enjoy the same right. This electorate has no navy, but a considerable marine on the great rivers Elbe and Weser.

In consideration of the great services performed by Ernest Augustus, duke of Brunswic-hanover, in the wars which the emperor Leopold had with Louis XIV. that emperor conferred the dignity of an elector of the holy Roman empire upon him and his heirs male, of which he received the investiture on the 19th of December 1692. This new creation met with great opposition both in the electoral college and the college of princes: at last, by a conclusion of the three colleges on the 30th of January 1708, it was unanimously determined, that the electoral dignity should be confirmed to the duke of Hanover and his heirs male; but it was added, that if, while that electoral dignity subsisted, the Palatine electorate should happen to fall into the hands of a Protestant prince, the first Catholic elector should have a supernumerary vote.

The princes of this house have their seat in the college of princes, immediately after those of the electoral houses; each branch having a vote. The elector, besides his seat in the electoral college, was invested with the office of arch standard-bearer of the empire; but this being disputed with him by the duke of Wirtemberg, the elector Palatine having obtained the office of arch-steward, yielded that of arch-treasurer to the elector of Hanover, who was confirmed in this dignity by a decree of the diet of the 13th of January 1710.

The sovereign power is administered by the lords of the regency appointed by the elector. Throughout all the provinces they possess a considerable share of free-

Hanover. dom, the people being represented in the assemblies of the states. No government can be more mild; and an air of content is spread over all the inhabitants. The Conseil Intime, the High Court of Justice, and the Regency, are the principal courts of justice; besides which, every province has its municipal administration with the inferior divisions into bailiwicks, &c. The police is excellent, and justice fairly administered. The elector enjoys the right *de non appellando* in all criminal affairs, but in civil processes only as far as 2000 florins.

Lutheranism is the established religion; but all others enjoy a perfect toleration, and are publicly exercised. Difference in religious sentiments here gives no interruption to that harmony which should subsist among fellow citizens. There are 750 Lutheran parishes, 14 Reformed communities, a Romish college, a convent, and some Catholic churches.

Literature is in a very advanced state throughout these dominions. The university of Gottingen is deservedly celebrated; and contains about 800 students of different nations, and 60 professors. There are besides several colleges, and a number of well established schools, throughout the electorate. In general, education is much attended to.

Although there are various tracts of heath and marshy ground, the soil in general produces abundance of corn, fruits, hemp, flax, tobacco, madder, and some wine. There are several large salt-works. A good deal of cattle are reared, and a great number of excellent horses. Most metals and minerals are found here. The forests furnish sufficient timber, and large quantities of pitch and tar.—The natural productions of the electorate furnish ample materials for commerce, so as to prevent the balance being against them, although their manufactures are not sufficient for consumption. Cattle, horses, salt, wrought iron, and fuel, are principal articles of export. Bremen is one of the greatest commercial towns in Germany.

The elector of Hanover is descended from the ancient family of the Guelphs, dukes and electors of Bavaria; one of whom, Henry the Lion, in 1140, married Maude, eldest daughter of king Henry (Plantagenet) II. of England. Their son William succeeded to Brunswic-Lunenburg, and his son Otho was created duke thereof. The dominions descended in a direct line to Ernest, who divided them upon his death in 1546 into two branches, that of Brunswic-Lunenburg Wolfenbüttele, and Brunswic-Lunenburg Zell. The possessor of the latter, Ernest Augustus, was in 1692 raised to the dignity of an elector; before which he was head of the college of German princes. Ernest married Sophia, daughter of Frederic elector Palatine and king of Bohemia, by Elizabeth, daughter of James I. king of England. Sophia being the next Protestant heir to the house of Stuart, the parliament fixed the crown of Great Britain upon her on queen Anne's demise; and George-Louis her eldest son became king of Great Britain in consequence thereof: since which the electors of Hanover have filled the British throne.

HANOVER is also the name of the capital of the above electorate; and is agreeably situated in a sandy plain on the river Leyne, in E. Long. 10. 5. N. Lat. 22. 5. It is a large well-built town, and pretty well

Hanse.

well fortified. It has suffered greatly by the French, who got possession of it in 1757, but were soon after driven out. It is noted for a particular kind of beer, reckoned excellent in these parts. This city was the residence of the elector before he ascended the throne of Great Britain. The palace makes no great shew outwardly, but within it is richly furnished. The regency of the country is administered in the same manner as if the sovereign was present.

HANSE, or HANS, an ancient name for a society or company of merchants; particularly that of certain cities in Germany, &c. hence called *Hanse-towns*. See *HANSE-Towns*.—The word *hanse* is obsolete High Dutch or Teutonic; and signifies “alliance, confederacy, association,” &c. Some derive it from the two German words, *am-see*, that is, “on the sea;” by reason the first hanse towns were all situated on the sea-coast: whence the society is said to have been first called *am zee steden*, that is, “cities on the sea;” and afterwards, by abbreviation, *hansee*, and *hanse*.

HANSE-Towns. The hanseatic society was a league between several maritime cities of Germany, for the mutual protection of their commerce. Bremen and Amsterdam were the two first that formed it; whose trade received such advantage by their fitting out two men of war in each to convoy their ships, that more cities continually entered into the league: even kings and princes made treaties with them, and were often glad of their assistance and protection; by which means they grew so powerful both by sea and land, that they raised armies as well as navies, enjoyed countries in sovereignty, and made peace or war, though always in defence of their trade, as if they had been an united state or commonwealth.

At this time also abundance of cities, though they had no great interest in trade, or intercourse with the ocean, came into their alliance for the preservation of their liberties: so that in 1200 we find no less than 72 cities in the list of the towns of the Hanse; particularly Bremen, Amsterdam, Antwerp, Rotterdam, Dort, Bruges, Ostend, Dunkirk, Middleburgh, Calais, Rouen, Rochelle, Bourdeaux, St Malo, Bayonne, Bilbao, Lisbon, Seville, Cadiz, Carthage, Barcelona, Marseilles, Leghorn, Naples, Messina, London, Lubec, Rostock, Stralsund, Stetin, Wismar, Königsberg, Dantzic, Elbing, Marienburg.

The alliance was now so powerful, that their ships of war were often hired by other princes to assist them against their enemies. They not only aided, but often defeated, all that opposed their commerce; and, particularly in 1358, they took such revenge of the Danish fleet in the Sound, for having interrupted their commerce, that Waldemar III. then king of Denmark, for the sake of peace, gave them up all Schonen for 16 years; by which they commanded the passage of the Sound in their own right.—In 1428 they made war on Erick king of Denmark with 250 sail, carrying on board 12,000 men. These so ravaged the coast of Jutland, that the king was glad to make peace with them.

Many privileges were bestowed upon the hanse towns by Louis XI. Charles VIII. Louis XII. and Francis I. kings of France; as well as by the emperor Charles V. who had divers loans of money from them; and by king Henry III. who also incorporated

them into a trading body, in acknowledgment for money which they advanced to him, as well as for the good services they did him by their naval forces in 1206.

These towns exercised a jurisdiction among themselves; for which purpose they were divided into four colleges or provinces, distinguished by the names of their four principal cities, viz. Lubec, Cologne, Brunswick, and Dantzic, wherein were held their courts of judicature. They had a common stock or treasury at Lubec, and power to call an assembly as often as necessary.—They kept magazines or warehouses for the sale of their merchandises in London, Bruges, Antwerp, Berg in Norway, Revel in Livonia, Novogorod in Muscovy, which were exported to most parts of Europe, in English, Dutch, and Flemish bottoms. One of their principal magazines was at London, where a society of German merchants was formed, called the *steelyard company*. To this company great privileges were granted by Edward I. but revoked by act of parliament in 1552 in the reign of Edward VI. on a complaint of the English merchants that this company had so engrossed the cloth-trade, that in the preceding year they had exported 50,000 pieces, while all the English together had shipped off but 1100. Queen Mary, who ascended the throne the year following, having resolved to marry Philip the emperor's son, suspended the execution of the act for three years: but after that term, whether by reason of some new statute, or in pursuance of that of king Edward, the privileges of that company were no longer regarded, and all efforts of the hanse-towns to recover this loss were in vain.

Another accident that happened to their mortification was while queen Elizabeth was at war with the Spaniards. Sir Francis Drake happening to meet 60 ships in the Tagus, laden with corn, belonging to the hanse-towns, took out all the corn as contraband goods which they were forbid to carry by their original patent. The hanse-towns having complained of this to the diet of the empire, the queen sent an ambassador thither to declare her reasons. The king of Poland likewise interested himself in the affair, because the city of Dantzic was under his protection. At last, though the queen strove hard to preserve the commerce of the English in Germany, the emperor excluded the English company of merchant-adventurers, who had considerable factories at Stade, Embden, Bremen, Hamburg, and Elbing, from all trade in the empire. In short, the hanse-towns, in Germany in particular, were not only in so flourishing, but in so formidable a state, from the 14th to the 16th centuries, that they gave umbrage to all the neighbouring princes, who threatened a strong confederacy against them; and, as the first step towards it, commanded all the cities within their dominion or jurisdiction to withdraw from the union or hanse, and be no farther concerned therein. This immediately separated all the cities of England, France, and Italy, from them. The hanse, on the other hand, prudently put themselves under the protection of the empire: and as the cities just now mentioned had withdrawn from them; so they withdrew from several more, and made a decree among themselves, that none should be admitted into their society but such as stood within the limits of the German empire,

Hanse.

Hanway.

empire, or were dependent thereon; except Dantzic, which continued a member, though in nowise dependent on the empire, only it had been summoned formerly to the imperial diet. By this means they maintained their confederacy for the protection of their trade, as it was begun, without being any more envied by their neighbours. Hereby likewise they were reduced to Lubec, Bremen, Hamburgh, and Dantzic; in the first of which they kept their register, and held assemblies once in three years at least. But this hanse or union has for some time been dissolved; and now every one of the cities carries on a trade separately for itself, according to the stipulation in such treaties of peace, &c. as are made for the empire betwixt the emperor and other potentates.

HANWAY (Jonas), eminent for his benevolent designs and useful writings, was born at Portsmouth in Hampshire on the 12th of August 1712. His father, Mr Thomas Hanway, was an officer in the naval service, and for some years store-keeper to the dockyard at that place. He was deprived of his life by an accident; and left his widow with four children, Jonas, William, Thomas, and Elizabeth, all of a very tender age. Mrs Hanway, coming to London after the death of her husband, put Jonas to school, where he learned writing and accounts, and made some proficiency in Latin. At the age of 17 he was sent to Lisbon, where he arrived in June 1729, and was bound apprentice to a merchant in that city. His early life, we are informed, was marked with that discreet attention to business, and love of neatness and regularity, which afterwards distinguished his character. At Lisbon his affections were captivated by a lady, then celebrated for her beauty and mental accomplishments; but she, preferring another for her husband, returned to England, and spent the latter part of her life in London with her family, on terms of friendship with Mr Hanway.—On the expiration of Mr Hanway's apprenticeship, he entered into business at Lisbon as a merchant or factor; but did not remain there long before he returned to London.

He soon after connected himself as a partner in Mr Dingley's house in St Petersburg; where he arrived on the 10th of June 1743. The trade of the English nation over the Caspian Sea into Persia at this period had been entrusted to the care of Mr Elton, who, not content with the pursuit of commercial affairs, had injudiciously engaged in the service of Nadir Shah to build ships on the Caspian after the European manner. This had alarmed the merchants in the Russian trade, and a resolution was formed that one of their body should make a journey into Persia. On this occasion Mr Hanway offered his service, and was accepted. He set out on the 10th of September; and after experiencing a variety of hazards in that kingdom during a course of 12 months, returned to St Petersburg January 1. 1745, without being able to establish the intended trade by the Caspian, partly through the jealousy of the Russian court on account of Elton's connections with the Persians, and partly by the troubles and revolutions of the latter kingdom.

Though Mr Hanway's conduct during this expedition seems to have been directed by the strictest rules of integrity, yet some difficulties arose in settling his demands on his employers. These, however, in

Hanway.

the end were referred to the determination of impartial arbitrators, who at length decided in his favour.

“ I obtained (he says) my own; and as to any other personal advantage, it consisted in exercising my mind in patience under trials, and encreasing my knowledge of the world.” He now settled at St Petersburg; where he remained five years, with no other variations in his life than such as may be supposed to occur in the dull round of a mercantile employment. During this time he interested himself greatly in the concerns of the merchants who had engaged in the Caspian trade: but the independence he had acquired having excited a desire to see his native country, he, after several disappointments which prevented him from accomplishing his wish, left St Petersburg on the 9th of July 1750. On his arrival in his native country, he did not immediately relinquish his mercantile connections, though he seems to have left Russia with that view. He employed himself some time as a merchant; but afterwards, more beneficially to the world, as a private gentleman. In 1753 he published “ An Historical Account of the British Trade over the Caspian Sea; with a Journal of Travels from London through Russia into Persia; and back again thro' Russia, Germany, and Holland. To which are added, the Revolutions of Persia during the present Century, with the particular History of the great Usurper Nadir Kouli,” 4 vols 4to: a work which was received, as it deserved to be, with great attention from the public. In 1754, we find Mr Hanway commending a plan offered for the advantage of Westminster, and suggesting hints for the further improvement of it, in “ A Letter to Mr John Spranger, on his excellent Proposal for Paving, Cleansing, and Lighting the Streets of Westminster, &c.” 8vo. A few years afterwards, when a scheme of the like kind was carried into effect, many of Mr Hanway's ideas, thrown out in this pamphlet, were adopted. In 1756, he printed “ A Journal of Eight Days Journey from Portsmouth to Kingston upon Thames, with an Essay on Tea;” which was afterwards reprinted in 2 vols 8vo, 1757.

At this juncture, Great Britain being on the eve of a war with France, the event of which was very important to the nation at large, and required every effort of patriotism and prudence to ward off the impending danger, Mr Hanway published “ Thoughts on the Duty of a good Citizen with regard to War and Invasion, in a Letter from a Citizen to his Friend,” 8vo. About the same time, several gentlemen formed a plan, which was matured and made perfect by the assiduity of Mr Hanway, for providing the navy with sailors, by furnishing poor children with necessaries to equip them for the service of their country. The success and propriety of this scheme soon became apparent. Mr Hanway wrote and published three pamphlets on this occasion; and the treasurer of the Society, accompanied by Mr Hanway, having waited on the king, the Society received 1000l. from his majesty, 400l. from the Prince of Wales, and 200l. from the Princess Dowager. This excellent institution through life was the favourite object of Mr Hanway's care, and continued to flourish under his auspices greatly to the advantage of the community. In 1758 he became an advocate for another

Hanway. charitable institution, which derived considerable emolument from his patronage of it. This was the Magdalen Charity; and to assist it he published "A Letter to Robert Dingley, Esq; being a proposal for the Relief and Employment of friendless Girls and repenting Prostitutes," 4to. He also printed other small performances on the same subject.

In 1759, Mr Hanway wrote "Reasons for an Augmentation of at least Twelve Thousand Mariners, to be employed in the Merchants Service and Coasting Trade, in 33 Letters to Charles Gray, Esq; of Colchester, 4to." The next year he published several performances: viz. 1. "A candid historical Account of the Hospital for the Reception of exposed and deserted young Children; representing the present Plan of it as productive of many Evils, and not adapted to the Genius and Happiness of this Nation," 8vo; which being answered by an anonymous Letter from Halifax in "Candid Remarks, 8vo 1760," Mr Hanway replied to it, and the Remarker rejoined. 2. "An Account of the Society for the Encouragement of the British Troops in Germany and North America, &c." 8vo. 3. "Eight Letters to — Duke of —, on the Custom of Vails-giving in England," 8vo. This practice of giving vails had arrived at a very extravagant pitch, especially among the servants of the great. It was Mr Hanway who answered the kind reproach of a friend in a high station for not coming oftener to dine with him, by saying "Indeed I cannot afford it." The nobleman to whom the above letters were addressed was the duke of Newcastle. The letters are written in that humorous style which is most attractive of general notice, and was best adapted to the subject. It was Sir Timothy Waldo that first put Mr Hanway on this plan. Sir Timothy had dined with the duke of N—, and, on his leaving the house, was contributing to the support and insolence of a train of servants who lined the hall; and at last put a crown into the hand of the cook, who returned it, saying, "Sir, I do not take silver."—"Don't you indeed!" said the worthy baronet, putting it in his pocket; "then I do not give gold." Among the ludicrous circumstances in Mr Hanway's letters is one which happened to himself. He was paying the servants of a respectable friend for a dinner which their master had invited him to, one by one as they appeared; "Sir, your great-coat;" a shilling—"Your hat;" a shilling—"Stick;" a shilling—"Umbrella;" a shilling—"Sir, your gloves;"—"Why, friend, you may keep the gloves; they are not worth a shilling." In 1761, Mr Hanway produced "Reflections, Essays, and Meditations on Life and Religion; with a Collection of Proverbs, and 28 Letters written occasionally on several Subjects," in 2 vols 8vo.

The many useful and public-spirited plans which Mr Hanway had promoted for the welfare of the community, had now rendered his character most respectably popular, while his disinterestedness, and the sincerity of his intentions, were conspicuous to all. Five citizens of London, of whom the late Mr Hoare the banker was one, waited on Lord Bute, at that time the minister; and, in their own names, and the names of their fellow-citizens, requested that some notice might be taken of a man, who, at the expence of his own private fortune, and unremitting application, had ren-

N^o 148.

Hanway. dered so many and such meritorious services to his country. In consequence of this request, he was in July 1762 appointed by a patent one of the commissioners for victualling the navy; a post which he held above 21 years. The next act of public beneficence in which we find him engaged is the collection of money for the sufferers by the fire which happened at Montreal, in the province of Quebec, in May 1765, when a fourth part of the city was consumed. On this occasion Mr Hanway, in conjunction with two other gentlemen, collected 8415l.—The very next year a dreadful fire broke out in Bridge Town in Barbadoes, which consumed buildings and property to the amount of near 100,000l. A subscription was opened, in which Mr Hanway was a principal actor, and 14,886l. were collected, and transmitted to a committee appointed at Barbadoes to distribute it to the unfortunate sufferers. At subsequent periods he continued to interest himself in various other plans for relieving the distressed, and promoting the good, of different classes of the community. His attention was particularly directed towards alleviating the miseries of young chimney-sweepers. Besides the distresses of these helpless beings, which are open to general observation, such as a contortion of the limbs, and the prevention of their growth, they are liable to a disease peculiar to their occupation, now known by the name of the *chimney-sweeper's cancer*. Four children have been brought together into a workhouse, all afflicted with this dreadful and incurable disease. After much inquiry and consideration, he published, in 1773, "The State of the Chimney-sweepers Young Apprentices; showing the wretched Condition of these distressed Boys; the ill Conduct of such Masters as do not observe the Obligation of Indentures; the Necessity of a strict Inquiry in order to support the civil and religious Rights of these Apprentices," 12mo. This small pamphlet has already been productive of some advantage to the objects intended to be benefited by it. The succeeding year 1774 he enlarged a former publication, entitled "Advice from a Farmer to his Daughter, &c." and republished it under the title of "Virtue in humble Life: containing Reflections on the reciprocal Duties of the Wealthy and Indigent, the Master and the Servant," 2 vol. 8vo; a work deserving the particular consideration of every magistratate. This edition in a few months being sold, he reprinted it in two quarto volumes, with a dedication to Mrs Montague.

In 1783, finding his health decline, he determined to resign his office at the victualling board, which he did on the 2d of October that year; and immediately received a grant of his whole salary by way of a pension, to continue for life. This favour he owed to the esteem which his majesty, to whom he was personally known, entertained of him; excited by his various exertions in behalf of his country and mankind.—He was now released from his most material business, but did not think it would conduce to his happiness to lead an idle life. He engaged again in behalf of the chimney-sweepers boys; and promoted, by every means in his power, the establishment of Sunday-schools, which are now in a fair way to be adopted in every county in England. He likewise promoted a subscription for the relief of the many black poor people who wandered about the metropolis in extreme distress;

5

and

Hanway. and the lords of the treasury seconded the design, by directing money, as far as 14l. a-head, to be issued to the committee, to enable them to send the blacks to such places abroad as might be fixed on. After encountering many obstacles, about 300 negroes were sent, properly accommodated with provisions and necessaries, to Africa, under the conduct of a person approved for that station. The object of this plan, besides relieving the misery of these poor people, was to prevent in time the unnatural connections between black persons and white, the disagreeable consequences of which make their appearance but too frequently in our streets.

In the summer of 1786 Mr Hanway's health declined so visibly that he thought it necessary to attend only to that. He had long felt the approach of a disorder in the bladder, which, increasing by degrees, caused a strangury; and at length, on the 5th of September 1786, put a period to a life spent almost entirely in the service of his fellow-creatures. On the 13th he was interred in the family-vault at Hanwell, being attended to the grave by a numerous retinue of friends; and since his death the public regard to his virtues has been displayed by a subscription of several hundred pounds towards erecting a monument to perpetuate his memory.

Mr Hanway in his person was of the middle size, of a thin spare habit, but well shaped: his limbs were fashioned with the nicest symmetry. In the latter years of his life he stooped very much; and when he walked, found it conduce to ease to let his head incline towards one side: but when he went first to Russia at the age of 30, his face was full and comely, and his person altogether such as obtained for him the appellation of the *Handsome Englishman*. In his dress, as far as was consistent with his ideas of health and ease, he accommodated himself to the prevailing fashion. As it was frequently necessary for him to appear in polite circles on unexpected occasions, he usually wore dress clothes, with a large French bag. His hat, ornamented with a gold button, was of a size and fashion to be worn as well under the arm as on the head. When it rained, a small paraplue defended his face and wig. Thus he was always prepared to enter into any company without impropriety or the appearance of negligence. His dress for set public occasions was a suit of rich dark brown; the coat and waistcoat lined throughout with ermine, which just appeared at the edges; and a small gold-hilted sword. As he was extremely susceptible of cold, he wore flannel under the linings of all his clothes, and usually three pair of stockings. He was the first man who ventured to walk the streets of London with an umbrella over his head. After carrying one near 30 years, he saw them come into general use. The precarious state of his health when he arrived in England from Russia, made it necessary for him to use the utmost caution; and his perseverance in following the advice of the medical practitioners was remarkable. After Dr Lieberkyn physician to the king of Prussia had recommended milk as a proper diet to restore his strength, he made it the chief part of his food for 30 years; and though it at first disagreed with him, he persisted in trying it under every preparation that it was capable of till it agreed with his stomach. By this rigid attention and care, his health was established;

VOL. VIII. Part I.

Hanway. his lungs acquired strength and elasticity; and it is probable he would have lived several years longer, if the disorder which was the immediate cause of his death had left him to the gradual decay of nature. His mind was the most active that it is possible to conceive; always on the wing, and never appearing to be weary. He rose in the summer at four or five, and in the winter at seven. Having always business before him, he was every day employed till the time of retiring to rest; and, when in health, was commonly asleep within two minutes after his lying down in bed.

Writing was his favourite employment, or rather amusement; and when the number of his literary works is considered, and that they were the produce only of those hours which he was able to snatch from public business, an idea may be formed of his application. But by leaving his work to transact his ordinary business, and afterwards recurring to it with new ideas, all his literary labours are defective in the arrangement of the matter, and appear to have too much of the miscellaneous in their composition. The original idea is sometimes left for the pursuit of one newly started, and either taken up again when the mind of the reader has almost lost it, or it is totally deserted. Yet those who are judges of literary composition say, that his language is well calculated to have the effect he desired on the reader, and impress him with the idea that the author was a man of inflexible integrity, and wrote from the pure dictates of the heart. It is plain and unornamented, without the appearance of art or the affectation of singularity. Its greatest defect (say they) is a want of conciseness; its greatest beauty, an unaffected and genuine simplicity. He spoke French and Portuguese, and understood the Rus and modern Persic imperfectly. Latin he had been taught at school, but had not much occasion to cultivate it after he entered into life.

Mr Hanway, although never married himself, was yet an advocate for marriage, and recommended it to all young people. He thought it the most effectual restraint on licentiousness, and that an increase of unhappiness was by no means the natural consequence of an increase of domestic cares. A "local habitation," with the society of a sensible woman, the choice of unbiassed affection, he esteemed as the most engaging persuasive to the love of order and economy; without which he thought life, in whatever station, must be disjointed and perturbed and unhappy. The lady who engaged his first affection was uncommonly handsome; and it is probable he was prevented from marrying only by his failing to obtain her, and the unsettled manner in which the first years of his life were spent: for he loved the society of women; and in the parties which frequently breakfasted at his house the ladies usually made the greater portion of the company.

In his transactions with the world, he was always open, candid, and sincere. Whatever he said might be depended on with implicit confidence. He adhered to the strict truth, even in the manner of his relation; and no brilliancy of thought could induce him to vary from the fact: but although so frank in his own proceedings, he had seen too much of life to be easily deceived by others; and he did not often place a confidence that was betrayed. He did not, however, think the world so degenerate as is commonly imagined:

R p

"And

Hanway
||
Happiness.

"And if I did (he used to say), I would not let it appear; for nothing can tend so effectually to make a man wicked, or to keep him so, as a marked suspicion. Confidence is the reward of truth and fidelity, and these should never be exerted in vain." In his department of commissioner for victualling the navy he was uncommonly assiduous and attentive; and kept the contractors and persons who had dealings with the office at a great distance. He would not even accept a hare or pheasant, or the smallest present, from any of them; and when any were sent him, he always returned them, not in a morose manner, as if he affected the excess of disinterestedness, but with some mild answer; such as, "Mr Hanway returns many thanks to Mr ——— for the present he intended him; but he has made it a rule not to accept any thing from any person engaged with the office: A rule which, whilst he acknowledges Mr ———'s good intentions, he hopes he will not expect him to break through." With all this goodness, Mr Hanway had a certain singularity of thought and manners, which was perhaps the consequence of his living the greater part of his life in foreign countries, and never having been married. He was not by any means an inattentive observer of the little forms of politeness: but as he had studied them in various realms, selecting those which he approved, his politeness differed from that of other people; and his conversation had an air of originality in it that was very pleasing.

Besides the works already mentioned in the course of this article, Mr Hanway was the author of a great number of others; his different publications amounting all together to between sixty and seventy. A complete list of them is given by his biographer Mr Pugh, from whose grateful and well-written performance this article has been chiefly extracted.

HAP, or HAPP, in law, signifies to catch or snatch a thing. Thus we meet with, to hap the possession of a deed-poll. Littleton, fol. 8. also, to hap the rent. If partition be made between two parceners, and more land be allowed the one than the other, she that hath most of the land charges it to the other, and happeth the rent whereon assize is brought.

HAPPINESS, or FELICITY, absolutely taken, denotes the durable possession of perfect good without any mixture of evil, or the enjoyment of pure pleasure unalloyed with pain; or a state in which all the wishes are satisfied: In which senses, Happiness is known only by name upon the earth. The word *happy*, when applied to any state or condition of human life, will admit of no positive definition, but is merely a relative term: that is, when we call a man happy, we mean that he is happier than some others with whom we compare him; than the generality of others; or than he himself was in some other situation.

This interesting subject has been treated by many eminent writers, and in a great variety of ways; but by none does it appear to have been set in a clearer and more definite point of view than by Archdeacon Paley in the sixth chapter of his *Principles of Philosophy*. "In strictness (says that elegant writer), any condition may be denominated happy in which the amount or aggregate of pleasure exceeds that of pain; and the degree of happiness depends upon the quantity of this excess. And the greatest quantity of it, ordinarily attainable in human life, is what we mean by happiness,

when we inquire or pronounce what human happiness consists in. Happiness
